INFA'NTICIDE, the act or practice of murdering infants, which is abhorrent to modern civilisation. was common in ancient times, and new prevails among many barbarous nations. It prevailed in Greece and Rome, and (such is the force of custom) found defenders in Plato and Aristotle! The latter, in his Politics, says the law should forbid the nurturing of the mained, and where a check to popula-tion is required, abortion should be produced before the quickening of the infant. In Sparta, we are informed that the law directed, when a child was born, the father was to carry it to an appointed place, to be inspected by the elders of the com-munity. If they perceived that its limbs were straight, and its look was wholesome, they returned it to its parents to be educated; otherwise, it was thrown into a deep cavern, at the foot of the mountain Taygetus; and it was said this law had a wholesome effect, for it made women with child very careful as to their eating, drinking, and exercise, and hence they preved excellent nurses. In the other Grecian republics, a similar disregard of the life of sickly infants was shewn. With regard to the practice among the Romans, little definite information exists, though learned authors discuss it at great length. It seems certain that it lay with the Roman father to say whether his child should be permitted to live or not. The exposition of infants, indeed, was the rule, rather than the exception, in most countries in old times. Among Norse, the child's life always hung in the balance till the father handed it to the nurse to be reared; if, en account of its being weak, or a daughter, he disapproved of its living, it was exposed to die by wild beasts or the weather. In modern times, the practice is cruelly common among certain peoples. Child-murder prevails to a great extent throughout the whole of the South Sea Islands, Among the Fijians, it is a system. A recent authority says, that in Vanua Levu in some parts, the extent of infanticide reaches pearer two thirds 'the extent of inflantence resents bearer two-sames than a half.' Among the Hindus, the practice of destroying children, especially females, prevailed frightfully, till it was checked in the time of the Marquis of Wellesley's rule. The Rajpúts, it is said, destrey all female children but the first-born —a peculiar custom, due to its being a point of honeur with a Rajpút to nearly ruin himself in the marriage feast and portion of his daughter, so that he could not afford to have more than one. The Mehammedans were inclined to the same practice, but effected their object chiefly by means of abortion. In New Holland, the native women think nething of destroying, by compression, the infant in the womb, to avoid the be, that infant schools are hurtful even at the best, trouble of rearing it alive. In China, infanticide

is supposed to be common, the chief cause being said to be the right of periodically repudiating their wives, which is possessed by Chinamen. Some statistics, recently published in the Esperance of Nancy, indicate the fearful extent to which life is lost through this practice prevailing in so vast a population as that of China. In all the cases above cited, it may be assumed there was no feeling of infanticide being wrong or criminal. In some, it was owing to religious feeling of a perverted kind; in some, to the difficulty of living; but in many, as among the Fijians, it would appear that the mother

killed her child often from whim, anger, or indolence.

Modern civilisation deals very differently with the subject of infanticide, for one of its maxims is that human life, from its first to its last hour, is sacred, and whoever wilfully puts an end to it is a murderer, or a criminal of the same category. Instead of encouraging the destruction of life, modern civilisation abounds in every kind of machinery for preserving it, however unsuccessful the attempt. The chief cause which now leads to infanticide is that of shame, which, however, operates only in the case of the child being illegitimate. The parents often incur the risk of committing the crime of murder, to avoid social disgrace. In order, therefore, to appreciate the force of the checks put by the law on the tendency to infanticide, the law of Bastardy (q. v.), the practice of instituting Founding Hospitals (q. v.), and the kind and degree of the punishments attending any attempt more or less direct to destroy the child either before or after

birth, require to be taken into account.

The criminal law deals with the cognate offences which make up infanticide in the following manner, whether the child is legitimate or illegitimate. As regards the procuring of abortion, every woman who takes poison or other noxious thing, or uses instruments or other means to procure her miscarriage, is guilty of felony, and hable to penal servitude for life, or not less than three years; and so is any person who administers poison or uses instruments upon the woman with such intent. Whoever supplies drugs, poison, or instruments for the same purpose, is guilty of a misdemeanour, and liable to penal servitude for three years. The concealment of birth is also made a criminal offence. Whoever, after a child is born, by any secret disposition of the body, endeavours to conceal its birth, is guilty of a misdemeanour, and liable to imprisonment for or a misteneanour, and hable to imprisonment for two years. This is the officere which, perhaps, is most frequently committed, or at least made the subject of prosecution in such cases, as the attempt to establish the larger crime of nurrier to the satisfaction of a jury, is frequently folled by the sacret sympathy above towards the mother, who is secret sympatry snewn cowards the moder, who presumed to have been the victim of seduction, or otherwise wronged. The existence of this offence shews the necessity which every woman likely to become a mother labours under of making public her situation to some extent. As the destruction of children may be effected by the negative fact of not supplying food and clothing, as well as by the positive act of wounding or ill-treating, the refusal or neglect of a parent or other person who is bound by law to supply food and clothing to the child, and neglects to do so, thereby causing its death, amounts either to murder or manslaughter, according to the circumstances. Moreover, the unlawful abandoning or exposure of any child under the age of two years, whereby the life and health of the child are endangered, is a misdemeanour punishable with three years penal servitude. Where a person is charged with the murder of a very young child, it is essential to prove that the child was in life. The test of this is not that it breathed, or had an inde-

pendent circulation after it was separated from the mother, but it is enough that the child was fully born: hence, if a man strike a woman with child, so as to cause the death of the child, he is neither so as to cause the death of the child, he is neither quilty of murder nor of manskaphter of the child. The judges of England, in 1848, had to ddilherately consider whether though a child was still attached to the navel-string, the killing of it was murder, and they held that it was In all cases of the murder of infants, the question whether the child was fully born, and so the subject of murder, is generally one of medical jurisprudence, upon which medical skill is needed to throw light, and medical men have certain well-known tests for ascertaining this important fact. The above offences in reference to infanticide are punished in a similar manner in Scotland.

One of the coroners in London recently stated that an inquest is held daily upon the bodies of children destroyed through the design, the neglect, the ignorance, or the mental intirmity of the mothers. Even when the act may fairly be regarded as a crime, its enormity is generally greatly lessened in the eye of the law by the consideration of the in the eye of the law by the consideration of the physical condition and moral disturbance of the parent. Where puerperal insanity supervenes, the infant is often sacrificed during the despair or violence of the mother; but even where there is no motive discoverable, no delusion, no explanation afforded, no outraged feeling or fury, there has been observed a morbid disposition to kill the newly born. This disposition is observed in certain of the lower animals; it has appeared epidemically. After the murder perpetrated by C. Cornier, five similar atrocities were noticed. Indian Infanticide, 1857.) (Rev. J. Cave Browne,

I'NFANTRY, the foot-soldiers of an army. Among semi-barbarous nations, fighting on foot has always been considered less advantageous than fighting on horseback or in chariots; but as war has become a science, the principal strength of armies is found to lie in their infantry. See Armies, Tactics, War, &c.

INFE'CTION is distinguished from Contagion (q. v.) by some medical writers, who would restrict the latter word to the cases in which there must be contact of the healthy person with a patient, while they apply the term infections to diseases which can be conveyed by the atmosphere. The distinction is unimportant.

INFE'CTIOUS DISORDERS in cattle have been made the subject of special enactment, in order to protect the public from the calamities arising from the spread of disease in so important an article of food. Though passed for a temporary period, the act 11 and 12 Vict. c. 107, has been continued from time to time, and will probably be ultimately declared permanent. The statute gives power to the police to seize any sheep or lambs exposed in any market which are infected or labouring under a disease called the sheep-pox, or various ovina. The parties who so expose them are liable to penalties, and the cattle may be destroyed; so if any person depasture diseased sheep on commons, woods, forests, waste lands, open fields, or the roadside.

INFETTMENT, or SASINE, a Scotch law-term, used to denote the symbolical giving possession of land, which was the completion of the title, the mere conveyance not being enough. The instrument of sasine was the notarial instrument embodying the fact of infeftment. But now the necessity of a separate formality is unnecessary, it being sufficient to register a conveyance in the register of sasines in Scotland. In England, there is no similar register

for deeds, and the title is complete when the conveyance is executed and delivered to the purchaser. In Scotland, an infestment in security is a temporary infeltment to secure payment of some debt; and an infestment of relief is a similar security to relieve a

INFINITE. This word is the source of much controversy and difference of opinion. Some hold that there corresponds to Infinity a distinct notion. which we are entitled to entertain and reason about, with the same confidence that we discuss measured intervals, as a yard or mile; while others maintain that the word is a name for a mere negative. Sir W. Hamilton goes so far as to say that 'the Infinite and the Absolute are only the names for two counterimbecilities of the human mind, transmuted into properties of the nature of things of two subjective negatives converted into objective affirmatives' (Discussions, p. 21). And Mr J. S. Mill holds a similar view. It had also been maintained by Locke that we have no positive idea of the infinite, that it was only the negative of an end or termination

(Essay on the Understanding, book ii. chap. 17). The notion of the infinite has, indeed, been admitted into mathematical reasoning, a circumstance that would seem to imply that we could use it with exactness, and, consequently, it could not be altogether an incompetence or imbecility of the understanding. It appears, however, that mathe-maticians use the word under peculiar restrictions. They employ it in the two extremes of the infinitely great and the infinitely little. 'If we see a conclusion, which we can nearly attain by the use of a large magnitude, more nearly by the use of a larger, and so on without limit, that is to say, as nearly as we please, if we may use a magnitude as large as we please, but which is never absolutely attained by any magnitude however great, then such conclusion may be said, for abbreviation, to be absolutely true when the magnitude is infinite' (Penny Cyc., art. 'Infinite'). The very same statement might be made regarding the infinitely small, which is represented in mathematics by the symbol for nothing, although it is not the same as nothing in the strictest sense, namely, the nothing caused by subtracting a quantity from itself, as two from two. It is nothing in this sense, that if added to a finite quantity, as 10, it produces no augmentation that can be made use of; the quantity for all purposes remains the same. The machinery of infinite quantities plays a large part in the operations of the higher mathematics, and is introduced in order to compare two things naturally incommensurate. Thus, in estimating the area of a curved surface, such as a circle, in straight-lined spaces, such as square inches, the difficulty was got over by a sort of fiction, namely, by supposing the circle to be inscribed by a right-lined figure or polygon, of such a very great number of sides that they coincide to all intents and purposes with the curved circumferonce. The coincidence can never be perfect; but by imagining the sides to be smaller and smaller, and, consequently, more and more numerous, the difference between the polygon and the circle may become less than any assignable quantity, or, as it may be said, infinitely little, in fact, as good as nothing, so that the estimate of the area of the one will stand for the estimate of the area of the other. This device for overcoming the natural incommensurability of straight and curved, and of number and motion, is the real occasion of the mathematical use of the term in question. Nor does it give any foundation for the view that would regard the infinite as a positive conception of the mind, which we may apply to objects with a conscious meaning.

This will be more apparent when we attend to the difference between two classes of negative notions, The first class includes those whose negative brings something positive; thus, not hot, brings before us a positive experience, namely, cold; not white. according to what is intended, turns un either black or all other colours, which are to us as much a positive, or real, conception as white. Unjust, or not just, is the name for a distinct class of really existing actions, in contrast to the class named just actions. All notions, such as these, which have for opposites really existing things, are real and genuine notions of the mind: they are conceivable by us to the full extent that we are capable of conceiving anything whatsoever. In fact, the highest test of genuineness, reality, and conceivability, is the existence of a negative, which is also real and nositive. Body or matter is a real conception by being opposed to space; the one resists our movements, and the other permits them. Body and space together make the extended universe, the world of externality, or objective existence; which has a distinct meaning by contrast to the inextended mind, or the subject universe. But existence, as a whole, is not a real conception, because we have nothing to oppose it to; non-existence is not a real opposite, bke space to body, or mind to extension; it is only a formal or verbal opposite, made up by using the word for negation to a case that does not admit of the operation. Non-existence is total annihilation, which, of course, we cannot conceive, as we do cold or black, in their opposition to hot and white. This being so, we have nothing to affirm respecting existence as expressing the absolute totality of things. See Extension.

Now, to which class of notions does infinite belong? Is it a real opposite to the finite, like cold to heat, or a verbal and formal opposite, like non-existence? Finite means what has a boundary or termina-tion, and applies strictly to body, which is always conceived by us as bounded and terminating in space. The bounded is, in fact, body (or some analogy of body, as when we fancy an enclosuro which we do not actually construct); the absence of bounds is free space, which is a real conception. It means scope for movement, freedom from obstruction, and its opposite is some inert matter, standing in our way, to prevent further movement.
The nubounded is thus another name for space; and when we arrive at a space with no further prospect of obstruction, we may call that a boundless space, but the only meaning we have thereby is a space which no longer contains material obstruction. And we can conceive of no other end of space. Our whole experience furnishes no other contrast except these two, space and body, and where the one ends, the mind must conceive the other. We may conceive the not-extended, it is true, by passing to the subject mind, with its feelings and volitions; but within the sphere of the extended, we have no choice but between space and body. We cannot conceive the end of space otherwise than by the beginning of resistance; anything else (not being the subject mind) would be non-existence, or annihilation.

The intinite may thus be the name for an abbreviation in mathematics, but as a real notion of the mind, it merely expresses our inability to pass beyond the region of our experience of matter and

INFINITE'SIMAL CALCULUS.

INFI'NITIVE. See VERB.

INFLAMMATION is the most important of all the morbid processes that fall under the notice

of the physician or surgeon. The most obvious symptoms or phenomena of inflammation, when it attacks an external or visible part, are pain, redness, heat, and swelling, or, in the words of Celsus, 'rubor et tumor cum calore et dolore.' The general characters of the process will be best understood by an assumed case. If a healthy man gets a sphitter of wood or any other foreign body imbedded in any fleshy part, he begins to experience pain at the part, and this is soon succeeded by redness of the skin, a firm and extremely tender swelling at and around the spot, and a sense of abnormal heat. These purely local symptoms are succeeded, if the inflammation reach a certain degree of intensity, by a general derangement of the vascular and nervous general derangement of the vascular and nervous systems, to which various names, such as consti-tutional disturbance, symptomatic or inflammatory fever, pyrexis, &c., have been applied. If the foreign body is extracted, the probability is that all these symptoms will gradually abate until the part at length regains its natural appearance and sonsotions In this case, the inflammation is said to terminate by resolution, and this is the most favourable mode of termination. If, however, the cause of irritation is not removed, or if the intensity of the morbid process exceed a certain point, the following phenomena occur: the swelling assumes a more projecting or pointed form, the part becomes a more projecting or pointer form, one part recombines softer, and the skin at its centre, which is usually the most projecting part, becomes whiter. There is a sensation of throbbing pain, and if the skin be not divided by the knife, it finally breaks, and a yellow, cream-like fluid, known as Pus (q. v.), escapes, after which the symptoms rapidly abate. This termination is known as suppuration.

If the original injury was very severe, and the inflammation intense, there may be actual death of the part affected. In that case, the red colour of to the part affected. In that case, the red colour of the skin becomes purple or greenish black, the pain ceases, and the part becomes dead and putrid. This is mortification. Under favourable circumstances, this dead part, which is called a dough, spontaneously separates from the adjacent living parts by a vital process known as *Ulceration* (q. v.), and the cavity which is thus formed gradually fills up

and heals.

The pain may vary from mere discomfort to tense agony. There is usually most pain in intense agony. those parts in which the tension produced by the swelling is the greatest, as in hone, serous and fibrous membranes, &c. The pain occurring in inflammation is always aggravated by pressure, and by this means the physician can often distinguish between inflammatory and non-inflammatory disorders. The heat is seldom so much increased as the sensations of the patient would lead him to believe; it does not rise above the maximum heat of the blood in the interior of the body. This increase of heat depends upon the increased flow of arterial (or highly oxidised) blood to the part. The redness depends upon there being more blood than usual in those vessels in the affected part which usually carry red blood; upon the blood containing an increased number of red corpuscles; and upon red blood entering into vessels which, in the normal state, convey colourless fluids only, or which naturally admit so few red corpuscles that they cannot usually be observed. The swelling depends in part upon the distension of the bloodressels, but mainly upon the effusion of various fluids, such as blood, scrum, coagulable lymph (or fibrine), and pus into the tissue of the affected part. These fluids are termed the products of inflamma-tion. This coagulable lymph frequently becomes organised, and many changes, some of a reparative nature (to which a reference will be presently made),

and others of a morbid nature, depend upon its

effusion.

Numerous observers have attempted to trace the exact phenomena of inflammation, by microscopic examination of the transparent parts of animals in which the process has been artificially excited. From observation made on the web of the frog's foot and other transparent parts of animals by Wharton Jones, Paget, and others, the following general conclusions may be drawn.

1. The primary effect of a slight stimulus applied to the blood-vessels is a slight and gradual contrac-tion, with a retardation of the current through

2. During this contraction, the blood is impeded, or altogether stops. But the vessels soon dilate to a size larger than they originally possessed, and the blood now moves through them more rapidly than in the normal state. The slight stimulus that previously caused the vessels to contract, has now, if re-applied, little or no effect; but on applying a more powerful irritant, such as a minute drop of tincture of capsicum, the phenomena of active congestion or determination of blood become almost instantaneously developed. The vessels become lengthened, dilated, and tortuous, and are distended with blood which contains a great excess of red corpuseles, and is circulated with far more than the normal velocity.

3. But if the injury be still more severe—if, for example, a red-hot needle be inserted-then, in addition to the active congestion described in the preceding paragraph, there is a retardation, and finally a complete stagnation of the blood in the capillaries of the injured spot, while around it the blood moves rapidly through turgid but less full

The blood obtained by bleeding a patient suffering from inflammation of any important organ, usually presents a peculiar appearance after coagulation. In healthy blood, the clot consists of a uniform admixture of blood corpuscles and coagulated fibrine, and is of a deep red colour; but in inflammation, the upper part of the clot consists of a layer of a vellowish or whitish colour, to which the term buffy coat is applied. This buffy coat is often concave, or hollowed out into a cup-like form, in which case the blood is said to be both buffed and cupped. The cause of this buffy coat is still to some extent au open question; but the phenomenon is clearly due to a subsidence of the blood corpuscles, by which a layer of fibrine, forming the buffy coat, is left at the surface. Another and a more important change in the blood in inflammation is the augmentation of the fibrine, which often rises to two, three, or more times its normal quantity.

Reference has already been made to coagulable

lymph or fibrine as one of the products of inflam-mation. This effusion of coagulable lymph is so important a process both for good and for evil, that a few lines must be devoted to its special

consideration.

When coagulable lymph is effused between membranes that are normally in contact (or nearly so) with one another, it often causes them to cohere. In this way we often have adhesions of the adjacent surfaces of serous membranes, such as the pleuræ, the pericardium, and the peritoneum, which materially interfere with the natural free motion of the parts, and occasion various persistent morbid symp-toms. In inflammation of the iris, the pupil may be rendered irregular or immovable, or may even be closed up by the effusion of coagulable lymph. In endocarditis, or inflammation of the lining mem-brane of the heart, coagulable lymph may be deposited in wart-like masses on the valves, and may thus

occasion some of the worst forms of cardiac disease. On the other hand, in many cases, the effusion of coagulable lymph has a reparative and conservative influence. It is by the organisation of this fluid that the lips of recent wounds are glued together, and that parts recently severed from the body may be sometimes replaced and still live. The success of the Talicotian operation, by which a new nose is engrafted in the position of that which had been lost—of the operation of injecting a stimulating fluid into cystic tumours, &c., with the view of setting up adhesive inflammation-and of various other surgical operations, essentially depends upon the property of organisation possessed by this fluid, It is thus, too, that ulcers are gradually filled up till the breach of texture is repaired.

The inflammatory diseases of the most important organs are described under their specific names, and, as a general rule, the termination -itis is employed to indicate an inflammation. Thus, pleuritis signifies inflammation of the pleura; peritonitis, inflammation of the peritoneum; iritis, inflammation of the iris; &c. Inflammation of the lungs, however, is usually known as pneumonia instead of

It is unnecessary to enter into the consideration of the treatment of inflammation further than to remark (1) that if possible we must remove its exciting cause, which can seldom be done except when the inflammation is external; and (2) that the patient should be placed on a strictly anti-phlogistic regimen (which implies a total abstinence from solid animal food and stimulating drinks, due attention to ventilation, temperature, &c.). Of the direct remedies, the most important (except in persons of weak or broken-down constitutions) is blood-letting, although at present it is somewhat ont of fashion. The medicines chiefly employed are purgatives, preparations of mercury, tartar emetic, and opium; while, as external applications, hot fomentations (occasionally cold lotions), and counterirritation by means of blisters, sinapisms, setons, &c., are often of service.

INFLE'CTION is a general name used by grammarians for all those changes that words undergo when placed in relation to one another in a sentence. See Declession, Conjugation, GENITIVE. Most of these changes occur in the end syllable or syllables of the word; and with regard to these at least, there is every reason to believe that they were originally separate words joined on to the root-words (see LANGUAGE), and that through the natural processes of phonetic that through the natural processes a pattern change and decay, the compounds thus formed gradually assumed the forms now known in grammar as cases, numbers, persons, tenses, &c. In some instances, the original suffix can be readily recognised, and, by the help of Comparative Grammar, much has been done in recent times in tracing the more disguised inflections to their source; so that the greater part may be considered as satisfactorily established. Confining our remarks to the Indo-European languages, we may safely assert, that the syllables used in forming the cases of nouns and the terminations of verbs are of pronominal origin. Thus, mi, si, ti, as the endings of the three persons of the present singular of the verb, are evidently connected with the personal pronouns ma, tra (sva), ta; and the plurals mas, tas, nti, contain the same with an indication of the plural number. The nominative singular of masculines and feminines, ending in a (equit-s, "irac-s, fini-s, wirers), contains the personal pronoun of the third person, ta (=0, nom. sa, i); the plural, pisces, ROOKERS, is probably only a corruption of the same pronoun put twice (pisci-sa-sa-i. e., fish that and

that), the doubling of the pronominal element expressing symbolically a plurality of the same thing. In the oblique cases, we meet with other pronominal elements, which indicate that a certain thing is placed with regard to the predicate in the three fundamental directions of motion—those of whither, where, and where. The accusative is the exponent of the direction of an action towards some object, and its termination m, in the plural ns (i.e., m with the plural termination s), is connected with the pronomen ama, yon. I (comp. Lat. i-s, i-d, i-bi) is the pronominal syllable employed for signifying that an action has arrived at a certain goal and is continuing there, giving the dative and locative cases; while the starting from a certain point is indicated by the pronoun of the third person, ta, and its equivalent sa (that), corrupted to t and s, the termination of the ablative and genitive cases, The dative and genitive of the plural express the same relations as the singular, though they are less clear as to their origin. If, notwithstanding the identity of terminations, the aggregate of nonns must, by a manifest analogy, be classified into several distinct declensions, this, in most cases, is to be accounted for by the difference of the formation of stems or bases previous to their coming in contact with the affixes. It is natural that the so-called crude forms should undergo a different process of contraction according to the nature of their final vowel. The dative lupo, from the crude form lupo, is as much a contraction of lupo-i, as is the dative fini from fini-i. Consonantic bases, or of the vocalic, those which end in u (v), a vowel of a decided consonantic quality, are most apt to preserve the inflections in their unaltered form, being less liable to change on the conflict of congruous or incompatible elements. Accordingly, we find that the third Greek, and the third and fourth Latin declensions, present a much more normal aspect of the original inflections than the others. This does not preclude the possibility of a peculiar inflection being preserved in one or other declension; for nothing is more certain than that language, at a certain stage of its development, created and applied a great variety of means to the same purpose, and that these became limited only when the rising intellect of the human tribes, and their distribution into larger or smaller political bodies, taught and compelled them to economise their ways of expression.

In the formation of certain tenses of the verb, we find a process different from the combination of a nominal or verbal base with a pronominal syllable, The Latin subjunctive of the first conjugation, the future in bo, the Greek optative and future, the Latin imperfect, and the perfect ending in avi, ui, ivi, consist of the verbal root with an already inflected form of the verbs i, to go, as and fu, to be. However strange this may appear at first sight, it is nevertheless a fact that, e.g., in, I would be (for io-in, Ser. s-yam, Lat. s-iem), originally meant, I go (if I mistake not) in being, I am in doubt of the act of being; that **oi-ou;, thon wilt do, is literally translated, 'thou mayst be doing.' The Latin i-bat for i-fuut, or i-vit for i-fuit, is still more clearly, 'he was in the act of going.' That auxiliary verbs someby the French future, where forms like trouverai, finirai, are easily recognised as compositions of the infinitive with the verb avoir (finir-ai, I have to

The inflections bitherto described affect the end of words, and possess the character of a composition of a significative word or root with a syllable of local import, or an inflected form of a verb. But language also employs other means of a symbolical nature, either in the middle or the beginning of

verbs, with the object of representing the various aspects in which an action can appear. We find that the present tenses generally have longer forms than those of the past. The additions commonly that the present tenses generally have ronger normally than those of the past. The additions commonly used are long vowels or diphthongs, inserted nasals and semi-vowels, or, lastly, reduplication. It seems that the weight given to the verbal root by these appliances is intended to exhibit the continuance of an action in the present tenses, in contrast with the fleeting or momentary operation of the past. In a similar manner, the long vowels peculiar to the subjunctive in Greek (TOTTST ον-τύστησον, τί rowway) convey the idea of doubt or uncertainty, by means of the longer interval required for the pronunciation of the intermediate long vowel, thus expressing the hesitation of the speaker with regard to the reality of his judgment. The reduplication in the perfect, being originally a repetition of the root (tu-tudi), is not so much the sign of a past time, as the symbol for an action having passed from the stage of incipience into that of completion.

The wear and tear of time exercises its influence as well on the radical part of words as on their inflections. Grammatical terminations of a totally different formation by corruption become obscured, and identical in shape with others of hetero-geneous purport. The Latin Romae takes on itself the functions of Roma-i-s (gen.), of Roma-i (dat.), the functions of Roma-1-8 (gen.), of Roma-1 (gat.), Româ-1-6 (hot.), and Româ-1-6 (nom. pl.); or populo those of populo-1 (dat.), populo-d (abl.), and at a very early age that of populo-m. The absence of written standard works of such a national importance as to penetrate into the masses of a people, and to check their inclination towards misapplying or neglecting inflections which in progress of time have lost their inherent meaning, and therefore appear cumbersome, accelerate the change of the inflective system into the analytical. The demand for a precise, and, so to speak, material expression of those manifold relations appropriated to inflections in ancient languages, is felt more keenly with the wauing distinctness of the latter; and sudden political revolutions, such as the invasion of Italy by Teutonic tribes, or the conquest of England by the Normans, interrupting the influence of the privileged classes of a nation, bring the struggle to an issue, and give the ascendency to the popular movement. Articles, prepositions, pronouns, auxiliary verbs, take in modern languages the place of inflections; and notwithstanding that these are not entirely destroyed, they have a precarious existence, and are in danger of being finally supplanted by the tendency to represent every distinct relation of words to each other by a distinct expression. The application of the s as a mark of the possessive case becomes more and more limited in modern English, and the mistaken effort to in modern English, and the mistaken effort to supersede this relic of Saxon inflection by the substitution of the pronoun his, has only been defeated because it proceeded from learned pedants, and not from the people. The termination nt as a sign of the plural in French verbs (aiment, aimment), may be called almost a dead letter, only traditionally preserved in spelling. The loss of inflections has deprived modern languages of the mnections has deprived modern languages of the wonderful simplicity and power of the ancient tongues, and the periphrastic mode of expression they have adopted prevents them from arranging all the parts of a sentence with the same degree of the parts of a sometime with the Same degree of liberty. On the other hand, they have gained in perspicuity. After all, they have only reversed the process of the combination of pronominal and auxiliary words with others; but by placing them in front, the attention of the hearer or reader is called at once to the particular modification of every possible shade of a given thought.

INFLECTION, in Optics, see Diffraction.

INFLORE'SCENCE (Lat. in, and floresco, to begin to flower), in Botany, a term employed to designate the flowers of a plant considered collectively and with reference to the manner in which they are arranged and the succession in which they are developed. The flower-bud being a modified leaf-bud, and the parts of the flower modified leaves, it might be expected that the inflorescence should exhibit a close correspondence with the ramification of the plant, but the modification in the parts immediately concerned in the production of flowers is so great, that this is far from being the case. A most important classification of kinds of inflorescence is into CENTRIFUGAL and CENTRIPETAL (q. v.). When the flowering axis produces only a single terminal flower, the inflorescence must be regarded as of the centrifugal kind. The terms used to designate more specifically the different kinds of inflor escence are numerous. The principal of them are explained under separate heads, as CATKIN, CONE, CORYMB. CYME. PANICLE. RACEME, SPIKE, UMBEL. CORYMB, CYME, FAMILE, HALLME, STREE, CADELL &c. But it is to be regretted that such terms are still used somewhat vaguely or carelessly, even by very eminent botanists, or in such various senses, that the inflorescence of the same plant is often described by one term in one hotanical work, and by another term in another. And hence arise confusion and difficulty, not entirely to be ascribed to the endless variety which is exhibited in nature.

INFLUENZA, one of the class of diseases to which the term Zamořic (q. v.) is now applied, has been long recognised by medical writers, although its annee, borrowed from the Italian, is comparatively modern in this country. Cullen called it cotarrhus e contaggio, but although, in most cases, it closely resembles ordinary catarrh, it presents certain points of difference from that disease. In addition to the ordinary symptoms of catarrh, there is a sudden, early, and very striking debility and depression of spirits. This early debility is one of the most marked and characteristic signs of influenca. The marked and characteristic signs of influenca. The marked and characteristic signs of influenca. The compared compared to the control of the control

In simple, uncomplicated cases, convalescence supervenes in the course of a week or sooner, but influenza is very frequently conjoined with bronchitis or pneumonia, in which case it is much more persistent and dangerous.

Influenza affords an excellent example of an epidemic disease, a whole community being often attacked in the course of a few hours. From this it may be inferred that the occurrence of this disease is connected with some particular condition of the atmosphere, but what that condition is, is not known. Not unfrequently, influenza follows closs upon a sudden thaw; sometimes it is preceded by thick, Ill-smelling fogs. One hypothesis refers the complaint to some clause in the electrical state of the complaint is some clause in the electrical state of the complaint of the configuration of the complaint of a complaint of the complaint

The most important point in the treatment of influenza is not to bleed the patient, or in any way

to depress his vital powers. He should be kept in bed; his bowels should be gently opened; his skin slightly acted upon, if dry; and, if the cough be troublesome, a mustard-poultice should be applied to the chest, and an expectorant mixture prescribed. In persons of weak or broken-down constitutions, ammonia, beef-tea, and wine and water, must be given from the outset. The debility that often remains for a considerable period after the establishment of convalescence, is best met by the preparations of iron and quinine.

Fow discusses increase the death-rate to such an

extent as influenza, more, however, in consequence of the great number of persons who are attacked in a severe epidemic, than in consequence of its danger

in individual cases.

IN FO'RMA PAU'PERIS, a term used when a person is allowed to sue as a pauper -1. e., by getting cave to dispense with paying the fees of court and other costs.

INFORMATION, in English law, is used in several senses. In criminal law, an information filed by the attorney-general or master of the crown office is a substitute for an ordinary indictment, and is resorted to only in cases of such misdemeauours as tend to disturb the peace or the government —for example, as libels on judges, magistrates, or public officers, bribery at elections, &c. This information is usually called a criminal or an ex officio information, and the defendant is put on his trial in the same way as under an indictment. There are other informations, such as those called quo warranto, to test the validity of an election or appointment to a public office, &c. An information by the attorney-general in Chancery is a suit on behalf of the crown or government as to any misapplication of a public charity, or on behalf of an idiot's or lanatic's property. The term is also commonly used to denote the written statement often but not invariably made on oath before a justice of the peace, previous to the issuing of a summons or complaint against a person charged either with a crime or an offence punishable summarily. There are also informations in the Court of Exchequer to recover penalties for breach of the revenue laws. The term is not now used technically in Scotland, except in cases of difficulty, when the Court of Justiciary orders informations-i.e., written arguments -on both sides.

INFORMER, in English law, the person who sucs for a penalty under some statute. lo many statutes which define offences-not criminal but savouring of criminality-encouragement is often given to strangers to come forward and prosecute the offence, by giving them power to suc for the penalty for their own benefit in whole or in part. This practice has been much resorted to in modern statutes on most subjects. In England, when the informer sues in such an action, it is called a penal or qui tum action; but, in general, the penalty is now recoverable before justices of the peace in a summary way. In suits in Chancery, which require to proceed in the name of the attorney-general, the informer is called a relator. In Scotland, an informer is the party who sets the Lord Advocate in motion in criminal prosecutions, and the Lord Advocate is bound to give up the name of the informer, who is liable in case of malicious prosecutions. See OUREN'S EVIDENCE.

INFU SIONS, or INFU'SA. These terms are applied in pharmacy to aqueous solutions of vegetable substances obtained without the aid of boiling. They are usually prepared by digesting in soft water (which may be either hot or cold, according to circumstances) the sliced or powdered 215

substance in an earthenware vessel fitted with a cover. Cold water is preferable when the active principle is very volatile, or when it is expedient to avoid the solution of some ingredient in the vegetable which is soluble in hot, but not in cold water. For example, in preparing the infusion of calumba, cold water is preferable, because it takes up the bitter principle (which is the essential ingredient), and leaves the starch-matter undissolved. In most cases, however, boiling water is employed. Infusions are preferred to decoctions when the active principle volatilises at a boiling heat, as in the case of essential oils; or when ebullition readily induces some chemical change, as in the case of

Infusions may also be prepared by Percolation (q. v.), a process which is extensively employed in the preparation of tinctures. When thus prepared, they are less liable to decay than when prepared on

the old system.

INFUSO'RIA, a class of the sub-kingdom of animals called Protozoa (q. v.). The term, originally almost synonymous with Animalcules (q. v.), is now very much restricted in its signification. It was first used by Otto Friederich Muller, and was adopted by Cuvier, who made the I. the last class of Radiata (q. v.). But their radiated structure is by no means established. No distinct trace of nervous matter has been found.-After Müller (1773-1786), the next to devote himself to the special study of the I. was Ehrenberg, the publication of whose work on them (1837) was the commencement of a new era in the history of this branch of zoology, which has since been prosecuted with great industry by Dujardin, Stein, Lachmann and Claparède, Côhn, Lieberkühn, Rymer Jones, and others. Many of the organisms included by Ehrenberg, as by previous naturalists, among I., are now generally regarded as vegetable (see Desmide.e and Diatomace.e.); whilst others, as the Cercariæ (q. v.), have been discovered to be immature states of Entozoa. The Rotifera (q. v.) are now also, by very general consent, widely separated from the Polygastrica of Ehrenberg, for which alone the term L, although not unobjectionable (see ANIMAL-CULE), is retained; the term Polygastrica (Gr. manystomached) being rejected, because it expresses a view of the structure of these creatures which is generally deemed erroneous. Agassiz has gone the length of proclaiming an opinion, not received by other naturalists, that the L are all immature or larval worms. But of the forms at present known, it is at all events probable that many are those of immature creatures; it is certain that some species assume very different forms at different stages of their existence; and the whole life-history of no one species is fully known.

Some of the L are large enough to be individually visible to the naked eye, but most of them are altogether microscopie. Their bodies are composed of surcode, a glutinous diaphanons substance, of which the outer layer sometimes forms a more or less resisting integrment. The body has some well-defined form, of which the varieties are very great in different species. Many are furnished with cilia, the motion of which carries them with great rapidity through the fluid in which they live, and by means of which also currents are created in the fluid to bring food to the mouth. The mouth is very generally surrounded or largely provided with Whether these organs are under the control of will, or maintain their motion without will or even consciousness on the part of the creature, like the cilia of the epithelium in higher animals, is not determined. There is an analogy in favour of the latter opinion, and many appearances-which.

however, the phenomena of zoospores, &c., teach us to regard as possibly deceptive - in favour of the latter. Some 1., instead of cilia, have a few slender filaments, which they agitate with an undulatory movement : others move by contractions and extensions of their bodies. Some have stiff bristle-like organs, which they use as feet for crawling on the surfaces of other bodies; and some have hooks,

by which they attach themselves to foreign bodies. All I. have a distinct mouth, and many have also an anal opening, sometimes near the mouth, sometimes at the opposite extremity of the body. Between these, Ehrenberg imagined that he could trace an intestine, straight in some, variously bent in others, with which along its course many small stomachs are connected; whilst in the L., having only one aperture, he supposed all the stomachs to open immediately from it. But other observers have failed to find the canal and stomachs, although Ehrenberg's experiments, by means of fluids coloured with indigo and carmine, have been often repeated. And it seems probable that the food taken into the mouth is simply conveyed into the midst of the soft gelatinous substance of the body, being formed into pellets as it passes from the mouth through a kind of gullet in the firmer integument. The food of I. consists of organic particles of various kinds, and different species have been remarked to shew a preference, like those of higher animals, for particular kinds of food. Many of them feed on microscopic plants and on other infusoria. Their great use in the economy of nature is probably to consume organic particles, the decomposition of which would otherwise he baneful to all life, and the return of which by decomposition to their primitive elements would diminish the fertility and wealth of the world. The numbers of the I. are predigious. They are found in all parts of the world, and both in fresh and salt water, in stagnant ponds and ditches, in mineral and hot springs, and in moist situations. Any infusion or other liquid containing vegetable or animal matter, if left exposed to the atmosphere, is sure to be full of them. Their multitudes are so great that leagues of the ocean are sometimes tinged by them. Some, which, instead of swimming freely, like most of their class, become surrounded with a gelatinous substance, are found adhering together in masses sometimes four or five inches in diameter, although the individual animals are so small that a cubic inch of the mass may contain 8,000,000 of them. The I. contained in a single cup of putrid water may exceed in number the whole human population of the globe!

The organisation of the I. is still very imper-fectly known. There appears in many of them a cavity not far from the mouth, the contractile space -variously regarded as a cavity without proper walls, or as a vesicle-from which branches some times radiate through the substance of the body, and which, being capable of contraction and expansion, is regarded by some as the centre of a kind of vascular system. It is with considerable probability regarded as furnished with proper walls. There is also, probably in all the I., another organ, evidently of great importance, although its use is still uncertain, called the nucleus, which is usually roundish or a little elongated, sometimes much elongated and band-like. It is enveloped in a membrane, and is more compact than the surtransverse. The multiplication of the I. in this way transverse. The manipulation of the f. in this way is extremely rapid. A Paramecium, well supplied with food, has been observed to undergo division every 24 hours, from which would result 16,384 individuals in a fortnight, or 268,435,456 in four weeks. Reproduction also takes place by gemmation; buds or gemmules forming on the outer surface of the body, and gradually assuming the shape of the parent animal, although they do not attain to their full size till after separation. More extraordinary is another mode of reproduction by encysting or encapsulation. The animal contracts, closes its mouth, becomes surrounded by a viscid secretion, and finally by a membrane, becomes attenuated, and dissolves, all but the nucleus, into a mere liquid containing granules, which afterwards form within the cyst a new infusorium, different in form and appearance from that by which the cyst was produced. The metamorphoses of the I, have been traced to a certain extent in some kinds, but not fully in any. Whether any truly sexual propagation takes place, has not been perfectly ascertained, although the observations of Balbiani have made it extremely probable as to some of them. A reproduction, different from all that has yet been mentioned, has been observed to take place in some, by the formation of internal germs, to which this character has been ascribed, but the subject is still involved in doubt; nor is it improbable that there may be amougst these minute creatures a production of real eggs, which has hitherto eluded observation.

has attherto ended observation.

In the integument of some I., very minute fusiform bodies are thickly imbedded, called trichocysts,
which are capable of throwing out long filaments. Their use is unknown, although they are supposed to be urticating organs. The filaments are thrown out when the animal is subjected to annoyance by the drying up of the liquid in which it lives, or by the application of some irritating liquid.

INFUSORIA, Fossil, See Diatomace. R.

INGEMANN, BEENHARD SEVERIN, one of the most distinguished poets and novelists of Denmark, was born May 28, 1789, in the island of Falster. His literary career may be divided into three distinct periods. The first of these, extending from 1811 to 1814, embraces his best lyrical productions, viz., the collection of poems entitled Procne (1812), and the allegorical epic of De Sorte Riddere (1814); while the second, or dramatic, ending in 1822, was marked by the appearance of numerous tragedies, which have maintained their place on the national stage, and among which the best are his Masaniello, Blanca, Rösten i Oerken (1815); Hyrden af Tolosa, Reinald, Underbarnet, Loveridderen (1816); and Tasso's Befriede (1819). Since this period, I.'s writings have been characterised either by a leaning to historical disquisition, or a strongly religious Store of Hans Mand (1824) was the prelude to the various historical novels, in which, taking Walter Scott for his model, he endeavoured to portray the social life and habits of his own country in the middle ages. Valdemar Seier, the first of the series (1826), and Erik Menved's Barndom (1828), which are generally regarded as the best of these producroundish or a little clongated, sometimes much are generally regarded as the best of these produc-clongated and band-like. It is enveloped in a long, may compete favourably with some of the membrane, and is more compact than the surr-most successful efforts of his great model; while rounding substance. In the multiplication of these even the less popular of his historical novels, Korg animals by spontaneous division, a fission of the Evil to g de Freilose (1833), and Prints Otto of nucleus always takes place. Each of the halves flans Soundá (1835), may justly entitle him to becomes furnished with a complete mouth, set or rank among the first hovelats of the day. The of clila, and other organs. The division, in the poems of Dronating Mariprete (1836) and Holger same specks, is sometimes longitudinal, sometimes Danake (1837), which are based, like his novels, on transverse, perhaps alternately longitudinal and incidents of Danish andonal history and tradition.

rank among I.'s most successful efforts. relicious element in this writer's mind has found Paris as the successor of Denon. In 1829, he sucexpression in various productions of considerable merit-as, for instance, in his collection of anthems of the church in his Blade of Jerusalem's Skomager's Lammebog (1833); Salamon's Ring (1839); and in his allegorical poem, Guldæblet (1856). I. held the chair of Æsthetics and Danish Literature at the Royal Academy of Soröe, near Copenhagen. His collective works have been published in 38 vols., 1857, Copenhagen, and the greater number of his prose works and many of his poems have been

INGERSOLL, CHARLES J., an American statesman, was born in Philadelphia, October 3, 1782. His father, Jared Ingersoll, was an active partisan in the American revolution, and a member of the convention which adopted the Federal constitution. Charles J. I. received a liberal education, which was completed by European travel. In 1801, he produced the tragedy of Edwy and Elgiva, and in 1808, a strong political pampldet in defence of the democratic policy of Mr Jefferson, and a satirical review of American politics, entitled Inchiquin's Letters (1810). He published two series of Historical Sketches of the War of 1812 (1845-1852). He was elected to Congress in 1812, and in 1814 advocated, in a powerful speech, the principle that 'free ships make free goods.' He was U.S. District Attorney for Pennsylvania from 1815 until 1829, and from 1840 to 1846 again represented his district in Congress. In 1847 President Polk appointed him Minister to France, but the Senate did not confirm the nomination. From this time until his death, May 11, 1862, he took no part in politics.

I'NGOLSTADT, or INGOLDESTADT (anciently Aureatum, and by the Latin writers of the 16th e. called Auripolis and Chrysopolis-i. e., 'the golden city'), a town and fortress of Upper Bavaria, is situated in a fertile district, on the left bank of the Danube, which is here crossed by a stone bridge, 46 miles north-north-west of Munich. It contains nine churches, a hospital, and a castle. Cloth, playing cards, and leather are manufactured; and breweries and a trade in corn are carried on. Pop.

I. is an ancient, melancholy-looking town, too large for the number of its inhabitants. A university was founded here in 1472, which reckoned Reuchlin, Aventin, and other eminent scholars among its professors; it was removed, however, to Landshut in 1800, and to Munich about six years after. At this university, in the 16th c., Urb. Rhegius the poet, known by the name of Dr Faustus, studied. I, was the first German town at which the Jesuits publicly from the university chairs. Loyola gave it the fond title of 'his little Benjamin.' After the suppression of the order in 1773, Adam Weisshaupt established here the order of the Illuminati of the river being especially distinguished for their elegance and strength.

INGRAULED. See ENGRAILED.

INGRES, JEAN DOMINIQUE AUGUSTE, an eminent French painter, was born at Montauban, 15th September 1751, studied under David (q. v.), and subsequently went to Rome. Here he resided for lifteen years, after which he spent four years in Florence, by which time his fame was so well established,

The that he was called to the School of Fine Arts in ceeded Horace Vernet as Director of the Academy at Rome; and in 1845, he was made Commander of the Legion of Honour. His merits as a painter have been very keenly canvassed, and unanimity of opinion is yet far from having been attained. I occupies a sort of middle place between the classic and romantic schools, but rather inclines to the former. His admirers praise him for eorrect design, ideal composition, and sober painting. rect design, ideal composition, and sober painting, Among his numerous pieces may be mentioned 'Raphael et la Fornarian,' Romalus, Vainqueur 'Arama,' Virgile lisant son Euride à Auguste et à Octavia,' 'La Mort de Léonard de Vinci,' 'Le Veau de Louis XIII,' 'L'Aporthéose d'Homère,' 'Stratonice,' 'Écsus au Millen des Docteurs,' 'Mo-lière dans son Cabinet,' and 'J'Aporthéose de Napo-lière dans son Cabinet,' and 'J'Aporthéose de Napoléon L, with a motto flattering enough to Napoleon III., In nepote redivious. See a continuation in the SUPPLEMENT, Vol. X. He died in January,

INGRIA. See ST PETERSBURG, GOVERNMENT OF.

INGRO'SSING, or ENGROSSING, a deed means. in Law, the writing it out in full and regular form on parchment or paper for signature. The person who engrosses is usually a law-stationer or clerk, In Scotland, the corresponding term is 'extending a deed, and the name of the person who does so must be named in the testing clause, which is not necessary in England.

INGULPH, Abbot of Croyland, long considered the author of the Historia Monasterii Croylandensis (History of the Monastery of Croyland or Crowland, in Lincolnshire), is supposed to have been born in London about 1030 A.D. According to the account of his life in his History, he studied oratory and philosophy at Oxford; became a favourite of Duke William of Normandy at his own court in 1051; and, after a disastrous pilgrimage to the Holy Land, entered a Norman monastery. Here he remained till 1076, when he was invited to England by the Conqueror, and made Abbot of Croyland, where he died December 17, 1109. The *Historia* London in 1596, and in a more complete edition by Gale at Oxford in 1684. It has been translated into English for Bohn's Antiquarian Library by Riley. Some writers even of the last century questioned the entire genuineness of the book : but their scenticism did not proceed further than the hypothesis of interpolations by a later writer; but in 1826, the late Sir Francis Palgrave, in an article in the Quarterly Review, endeavoured to prove that the whole so-called History was little better than a in the 13th or 14th century. His conclusions have been, on the whole, almost universally adopted.

INHE'RITANCE. See HEIRS, INTESTACY, WILL,

INHIBITION, in Scotch Law, is a writ which is issued in order to prohibit a person from abenating his heritable estate until the debt of the creditor is

I'NIA (Inia Bolimensis), a cetaceous animal, of the family Delphicules, in form resembling a dolphin, with a long and slender snout. It is the only known species of its genus, and is one of the few cetacen which inhabit fresh water. It is found in some of the upper tributaries of the Amazons, and in the lakes near the Cordilleras. It is from seven to twelve or fourteen feet long. The I. feeds chiefly

on fish. It is pursued for the sake of the oil which it yields. It is generally found in little troops of

Inia (Bolimensis)

three or four. The females show ereat affection for their young

INI'TIALS. Though in general it is usual and recuiar in all legal deeds and writings for a party to write his full Christian name and surname, yet in many cases, especially in documents of a mercantile nature, signature by initials will bind equally with the full signature.

INJECTIONS. This term is applied in medicine to fluids thrown into the passages or cavities of the body by means of a syringe or elastic bag. The fluids thus injected into the rectum or lower bowel are termed Clysters (q.v.). The injection of a dilute solution of salt into the veins has been found to be of great service in even advanced cases of Asiatic cholera. The injection of blood into the veins is described in the article Transfusion of Blood.

INJUNCTION, a writ by which equity interferes to prevent the commission of fraud and mischief. either (1) by staying proceedings in other courts where they are perverted into instruments of injustice, (2) by restraining the infringement of a privilege granted by statute, as in copy-and patent-rights, &c., (3) by staying waste, preventing nuisances and trespasses, &c., (4) by restraining the assignment of negotiable securities where they have been obtained by fraud, and to prevent them from being passed into the hands of an innocent purchaser against whom the fraud could not be set up. See INTERDICT.

INK. Inks may be classed as Writing Inks and Printing Inks.

1. Writing Ink .- The composition of the ink used by the ancients is not well understood; it is, how-ever, certain that their ink exceeded ours in blackness and durability. Mr Underwood (who read a paper upon the subject of ink hefore the Society of Arts in 1857) thinks that some old ink was merely a carbon pigment, like the Indian ink of the present day, while other kinds were veritable dyes of iron and acids (true chemical compounds), with the

addition of a good deal of carbon The essential constituents of ordinary black ink are galls, sulphate of iron (popularly known as green vitriol or green copperas), and gum; and the most important point is the regulation of the pro-portion of the sulphate of iron to the galls. If the former is in excess, the ink, although black at first, soon becomes brown and yellow. The gum is added to retain the colouring matter in suspension, and to prevent the mixture from being too fluid. The following prescription by Professor Brande yields a very good ink: Boil six ounces of finely bruised Aleppo galls in six pints of water, then add four ounces of clean and well crystallised sulphate of iron, and four ounces of gum-arabie. Keep the

creasote is useful as a check to the formation of mould. Stephens's ink-a blue liquid, which in mould. Stephens's ink-a blue liquid, which in a few hours after its deposition on paper becomes a few hours after its deposition on paper became of an intense black—is one of the most popular of our writing fluids. It consists essentially of gallo-tannate of iron, discoved in sulphate of indigo, while in ordinary ink the colouring matter is merely suspended by means of the gum. Runge, a German chemist, has discovered a simple and cheap black writing fluid, prepared from chromate of potash and a solution of logwood, which possesses the properties of forming no deposit, of adhering strongly to the paper, of being unaffected by exposure to water or acids, and of neither acting on, nor being acted on

acids, and of neuther acting on, nor being acted on by steel pens, but soon become glutinous, and useless. Various receipts for indelble inde have at different times been published. Dr. Normandy asserts that the ink obtained by the following combination cannot be obliterated or delicated by any known chemical agent: Twenty-four pounds of Frankfurt blank (which its supposed to be a charcoal obtained from grape and vine lees, peach kernels, and bone-shavings) must be ground with mucilage, formed by adding twenty pounds of gum-arabic to sixty gallons of water, and the mixture strained through a coarse flaunel; four pounds of oxalic acid are then added, together with as much decoction of cochineal or sulphate of indigo as will give the required shade.

Red Inks are of two kinds, one variety consisting essentially of the tinctorial matter of Brazil-wood essentially of the unctorial matter of Brazil-wood, and the other being prepared from cochineal or carmine. Stephens's red ink, which is one of the best of these preparations, is obtained as follows: 'Add to a quantity of common earbonate of potash, soda, or ammonia, twice its weight of crude argol in powder. When the effervescence has ceased, decant or filter the solution from the insoluble matter. To this fluid add by measure half its quantity of oxalate of alumina, prepared by dissolv-ing damp, newly precipitated alumina in as small ing damp, newly precipitated alumina in as small a quantity as possible of a concentrated solution of oxalic acid. The mixture thus prepared is next coloured, when cold, with bruised or powdered cochineal, and after standing for forty-right hours, is strained, when it is fit for use. (Muspratt's Chemistry, vol. ii. p. 378.)

Blue Inks are now chiefly made either directly or

indirectly from Prussian blue. Stephens's unchangeable blue ink is formed by dissolving this salt (which should be first well washed in a dilute mineral acid) in an aqueous solution of oxalic acid. Ink of which Prussian blue is the basis, is unaffected by any of the numerous physical causes which operate injuriously on black ink, unless it be exposed to a strong light, when the iron (which exists as a sesquioxide in Prussian blue) becomes deoxidised, and causes the colour of this ink to fade; but on removing the writing from the influence of light, the colour is restored.

Purple, green, and yellow inks have been formed by various chemists, but they are not of sufficient importance to claim a notice in this article.

Sympathetic Inks leave no trace of colour upon the paper, but when exposed to heat or chemical action of some kind, become more or less distinctly apparent. The following are a few of the principal kinds of this class of compounds. On writing with a solution of sugar (acctate) of lead or of ternitrate of bismuth, and washing the paper with a solution of hydrosulphuric acid (sulphuretted hydrogen), the letters come out black. On writing with a solution of nitrate of cobalt, and washing the paper with a solution of oxalic acid, the letters come out blue whole in a wooden or glass vessel, occasionally On writing with a solution of subactate of lead shaken. In two months, strain, and pour off the and washing the paper with a solution of solide of ink into glass bottles. The addition of a little potassium, the letters come out yellow; or on writing On writing with a solution of subacetate of lead and washing the paper with a solution of iodide of

gently leating the paper, the letters which were which disappears on cooling. On writing with a solution of arsenite of potash, and washing the paper with a solution of nitrate of copper, the letters come

2. Printing Ink is a soft glossy compound, altogether different in its composition from the inks which have been already described. The following are, according to Mr Underwood (in the paper already referred to), the necessary conditions of a good printing ink: I. It must distribute freely; 2. It must have much greater affinity for the paper than for the type; 3. It must dry almost immediately on the paper, but not dry at all on the type or rollers; this is a great desideratum, especially for newspapers; 4. It should be literally proof against the effects of time and chemical reagents, and should never change colour. It is prepared by boiling the best linseed oil in an iron pot, kindling and allowing it to burn for a short time; by this operation the oil acquires the necessary drying quality. After being again boiled, resin is dissolved in it, in order to communicate body to the fluid, which now somewhat resembles Canadian balsam, The colouring matter-which is lampblack for black ink; carmine, lake, vermilion, &c., for red ink; indigo or Prussian blue for blue ink; lemon and orange chrome (chromate and bichromate of lead), or gamboge, for yellow ink, &c. -is then added to the hot mixture, and the whole is drawn off, and finally ground into a smooth uniform paste.

In Lithography, a writing and a printing ink are employed, both of which differ altogether from the compounds already described. The writing ink is composed, according to Muspratt, of the following materials: shell-lac, soap, white wax, and tallow in certain proportions, to which is added a strong solution of gum-sandarach, and it is coloured with lampblack; while the printing ink, which is employed to take impressions on paper from engraved plates, with a view to their transference to the stone, is composed of tallow, wax, soap, shell-lac, gum-mastic, black pitch, and lampblack.

INKERMANN, a small Tartar village in the Crimea, is situated near the eastern extremity of the harhour of Sevastopol. It is memorable for the battle which took place there, during the Russian war, between an army of Russians 60,000 strong, and detachments of allied forces, consisting of about 14,000 troops actually engaged. At about six o'clock on the morning of the 5th November 1854, the Russians, who had marched westward from Sevastopol, along the southern shore of the harbour, and whose movements were concealed by the darkness and a thick, drizzling rain, appeared crowding up the slopes of the plateau to the south, on which the the stopes of the plateau to the south, on which the allies were posted. Here a handful of men, about 1400 strong, a portion of the 'Household Guards,' made a most heroic stand for six consecutive hours against a body of Russians that was probably ten times as numerous. Reinforcements, both English and French, coming up to the rescue, the Russians were finally driven from the field.

INLAND BILL of Exchange means a bill of exchange drawn by and upon persons living in the same country. The rules applicable to foreign bills differ in some respects from those applicable to inland bills. By a recent statute, all bills drawn by persons in England on persons in Scotland or Ireland, and vice versa, are to be treated as inland bills.

INLA'YING is the art of decorating flat surfaces by the insertion of similar or different materials; for travellers, which any person may set up without thus, wood of one colour is decorated by inlaying licence like any other trade. It is when excisable

with a dilute solution of chloride of copper, and with others of different colours: to this kind of inlaying the French term marqueterie is now generally applied. Metal of one kind is inlaid with other kinds, and often very beautiful effects are produced. When steel is inlaid with gold or hrass, it is usually called Damasecne work. One variety produced in India is called Kuft-gori -in this, the inlaid metal, usually gold, occupies more of the surface than the metal forming the ground. Another beautiful variety of Indian inlaying is ealled Tutenague or Bedery-work, which consists in making the article to be inlaid, most frequently a hookah bowl, of an alloy consisting of copper one part to pewter four parts. This is hard, but is easily cut; the pattern is then engraved, and little pieces of thin silver ent to the desired forms are dexterously hammered into the spaces thus ent out to receive them. Ivory, pearl, shell, bone, tortoise-shell, are favourite substances for inlaying wood; and stone or marble is inlaid with an immense variety of coloured stones. In the art of stone-inlaving, the Florentines have long held the palm; their favourite work is black marble, with inlaid figures of brilliant-coloured stones; this work is called pietra dura, or Florentine work. Very beautiful work of this kind, excelling the Florentine, is now made in the Imperial works at St Petersburg, where the art has of late been sedulously cultivated by the Russian government. This art was always a favourite one in Delhi and Agra, where some of the most exquisite work is still produced. Usually, in the Indian work, white marble forms the groundwork, and the figures are formed of carnelian, jasper, agate, jade, lapis-lazuli, and other costly hard stones. No stone-inlaying has ever rivalled the inlaid marble walls of the celebrated Taj Mahal, the tomb of the sultana of Shah Jehan, at Agra. The designs are very artistic, the execution almost marvellous, and the harmony of colour produced by the different stones employed is most beautiful. Many other materials than those mentioned are used for inlaying; and there is a style of inlaid-work in which small squares of coloured stone, glass, or pottery are made to form pictorial and artistic decorations; this is called Mosaicwork (q. v.).

INLET, an arm of the sea open only on one side, and stretching into the land, is distinguished from a Bay (q. v.) only by its smaller size, as a haven is, again, by still smaller dimensions, distinguished from an inlet. Examples of inlets are seen in the indentations of the west coast of Norway; as of bays in the deeper and wider indentations of the coast of Italy.

INN (ancient Enus), a river of Germany, the most important Alpine affluent of the Danube, rises in the south of the Swiss canton of Grisons, at a height of 4293 feet above sea-level, and flowing north-east through that canton forms the valley of the Engadine. It maintains generally a north-east course to its junction with the Danube. Leaving Switzerland, it enters the Austrian dominions at the village of Finstermunz, flows through the crownland of Tyrol, and crosses the south-east angle of Bavaria and Upper Austria, it enters the Danube at Passau, after a course of 285 miles. Its prineipal affluent is the Salza from the south. It is regularly navigable from the town of Hall, eight miles below Innsbruck. At its junction with the Danube, the Inn is broader than the Danube itself.

INN AND INNKEEPER (see Hotel). In point of law, an inn is merely a house of entertainment

liquors are sold that a licence is required. Publichouses and alc-houses are, however, synonymous terms with inns, for the innkeeper almost invariably finds it expedient to obtain the necessary licence to sell spirits and beer. As to these licences, see BEER ACTS and PUBLIC-HOUSES. The rights and duties of innkeepers, irrespective of the licence, will here be noticed. It may be observed, in the first place, that though public-houses are always inns, yet beer-houses are not so, the latter being merely shops for selling beer and a few other liquors, the distinguishing characteristic of the public-house being, that refreshment as well as lodging may be had on the premises by all comers. Taverns are chiefly places for the sale of wines and liquors; victualling-houses, for the sale of victuals; coffeehouses and hotels are also varieties, all of which may or may not be inns, according as they do or do not hold themselves out to give meat, drink, and lodgings to all travellers; and it is not at all necessary that any sign-board be put up to distinguish the inn.

One of the incidents of an innkeeper is, that he is bound to open his house to all travellers without distinction, and has no option to refuse such refreshment, shelter, and accommodation as he possesses, provided the person who applies is of the description of a traveller, and able and ready to pay the customary hire, and is not drunk or disorderly, or tainted with infectious disease. He disorderly, or tainted with infections usesses. It is, of course, bound only to give such accommodation as he has. If the traveller has a horse and luggage, the innkeeper is bound to receive these also, if he has accommodation, provided the traveller himself intends to lodge there as a guest. But the traveller is not entitled to select whatever room he pleases, and if he will not accept such reasonable accommodation as is offered, the innkeeper can order him to leave the house. As some compensation for this compulsory hospitality, the innkeeper is allowed certain privileges; thus, he has a lien on the horse and carriage or goods of the guest for that part of the bill or reckoning applicable to each respectively—i. e., he can keep these until he is paid for the keep, even though they are not the property of the guest. But he cannot detain the person of his guest until payment is made, for if so, a man might be imprisoned for life without any legal process or adjudication. While, however, an innkeeper has this remedy for his score, he is also liable to great responsibility for the safety of his guests and their goods. By the Roman law, under the edict naute, coupones, stabularii, he was bound to restore safely whatever goods of his guests were intrusted to him, unless some damnum fatale, or some act of God, prevented his doing so. This rule has been adopted by the has doing so. This rule has been aspect by the law of England. Hence, if the guest be robbed of his goods at the inn, the innkeeper is liable, unless the robbery was caused by the guest's servant or companion, or by his own gross negligence, as, for example, hy leaving a box containing money in the commercial-room, after exposing its contents to the bystanders. So the innkeeper will be excused if the guest took upon himself the charge of his own goods, yet the guest does not take that charge by merely accepting from the landlord the key of the room, though that may be an element in the ques-A guest who takes all reasonable precaution tion. as, for example, locking his room-door - and is yet robbed, has therefore a good claim on the landlord for indemnity; and the landlord will not escape

It has been attempted to extend the commonlaw hishlifty of innkeepers for the safety of the goods of their guests to ordinary lodging-house keepers, but the courts have held that an ordinary boarding-house keeper or lodging-house keeper is only responsible for ordinary care, i.e., such care as he takes of his own goods. He must, it is true, be careful in selecting his servants, but he is not bound absolutely to return the goods safe merely because they were in his house along with the lodger.

In Southand, the Roman rule of law as to the responsibility of inukeepers for the safety of the safety and the other same as in super-same as the same as in super-same as the same as in the same as in super-same as the same as the same. Super-same as the same as the same

INNER HOUSE, the name given in Scotland to the higher divisions of the Court of Session (q. v.).

INNER TEMPLE, one of the four Inns of Court in London having the exclusive privilege of calling persons to the English har. See INN OF COURT.

INNISCA'TTERY. See SCATTERY ISLAND.

INNISHERKIN, a small island on the south coast of Ireland, belonging to the county of Cork, from the shore of which it is separated by a channel a quarter of a mile in width, is about one mile north-cast of Clear Island. It is well cultivated, and contains some good and extensively worked slate-quarries. Pop upwards of 1000.

I'NNOCENT, the name of 13 popes, the most remarkable of whom are the following.—Innocent I., a native of Albano, was elected Bishop of Rome in 402. Next to the pontificate of Leo the Great, that of Innocent I. forms the most important epoch in the history of the relations of the see of Rome with the other churches, both of the East and of the West. Under him, according to Protestant historians, the system of naming legates to act in the name of the Roman bishop in different portions of the church originated; while Catholies at least admit that it received a fuller organisation and development. He was earnest and vigorous in enforcing the cehbacy of the clergy. He maintained, with a firm band, the right of the Bishop of Rome to receive and to judge appeals from other churches, and his letters abound with assertions of universal jurisdiction, to which Catholics appeal as evidence of the early exercise of the Roman primacy, and from which Dean Milman infers that there had already dawned upon his mind the conception of Rome's universal ecclesiastical supremacy, dim as yet and shadowy, yet full and comprehensive in its outline' (Latin Christianity, i. p. 87). Innocent I. died in 417.

his doing so. This rule has been adopted by the law of England. Hence, if the guest be robbed of his goods at the inu, the innkeeper is liable, unless the robbery was caused by the guest's servant or companion, or by his own gross negligence, as, for example, the leaving a box containing money in the commercial-room, after exposing its contents to the bestanders. So the innkeeper will be excused if the guest does not take that charge by interest accepting from the innilorit the key of the room, though that may be an element in the quest-tion. A guest who takes all reasonable precaution—as, for example, locking his room-too-call institution of the temporal, as wand it is room, though that may be an element in the quest-tion. A guest who takes all reasonable precaution—as, for example, locking his room-too-call is being the control of the innilorit will not be answerable for such for such as the control of the indemnity; and the landlord will not every state and kingdom was brought will not be answerable for such houses, which is the proof of the part very under the theory of the keepers of such houses, freeders that the such particular that in the great that had a such as the call that the proof of the temperature of the part very will not be answerable for such houses, in the such particular that the great that had such as the proof of the temperature of the part very will not be answerable for such houses, freeders that the distinctions for its accomplishment than Ilmocent to the part very will not be answerable for such houses, freederick II. of Italy), who was a ward of I.'s, the authority of the pope within his own states was fully consoli-dated, and his influence among the other states of Italy was confirmed and extended. In Germany, he adjudicated with anthority upon the rival claims of Otho and Philip; and a second time he interposed effectually in behalf of his ward, Frederick II. Iu France, espousing the cause of the injured Ingerburga, he compelled her nuworthy husband, Philip Augustus, to dismiss Agnes de Meranic, whom he had unlawfully married, and to take back Ingerburga, In Spain, he exercised a sundar authority over the king of Leon, who had married within the prohibited degrees. The history of his conflict with the weak and unprincipled John of England would carry us beyond the space at our disposal. If it exhibits I.'s character for consistent a herence to principle, and his lofty indiff rence to the suggestions of expediency, in a less favourable point of view than his other similar contests, it at the same time displays in a stronger light the extent of his pretensions and the completeness of his supremacy. In Norway, he exercised the same authority in reference to the usurper Swero. In Aragon, he received the fealty of the king Alfonso. Even the king of Armenia, Leo, received his legates, and accepted from them the investiture of his kingdom. And, as if in order that nothing might be wanting to the completeness of his anthority throughout the then known world, the Latin conquest of Constantinopic, and the establishment of the Latin kingdom of Jerusalem, put an end, at least during his pontificate, to the shadowy pretensions of the eastern rivals of his bower, spiritual as well as temporal. Pursuing consistently the great idea which inspired his entire career, his views of the absoluteness of the authority of the church within her own dominion were no less unbending than his notion of the universality of its extent. To him, every offence against religion was a crime against society, and, in his ideal Christian republic, every heresy was a rebellion which it was the duty of the rulers to resist and repress. It was at his call, therefore, that the crusade against the Albigenses was organised and undertaken; and although he can hardly be held responsible for the fearful excesses into which it ran, and although at its close he used all his endcavours to procure the restitution of the lands of the young Count of Toulouse, yet it is clear from his letters that he regarded the undertaking itself not merely as lawful. but as a glorious enterprise of religion and piety. As an ecclesiastical administrator, I. holds a high place in his order. He was a vigorous guardian of public and private morality, a steady protector of the weak, zealous in the repression of simony and other abuses of the time. He prohibited the arbitrary multiplication of religious orders by private authority, but he lent all the force of his power and influence to the remarkable spiritual movement in which the two great orders, the Franciscan and the Dominican (q. v.), had their origin. It was under him that the celebrated fourth Lateran Council was held in 1215. In the following year, he was seized with his fatal illness, and died in July at Perngia, at with his fath inness, and died in July at Terrigia, at the early age of 56. His works, consisting princi-pally of letters and sermons, and of a remarkable treatise On the Misery of the Condition of Man, were published in two vols. folio (Paris, 1682). It is from these letters and decretals alone that the character of the age, and the true significance of the churchpolicy of this extraordinary man, can be fully understood; and it is only from a careful study of them, that the nature of his views and objects can medieval history will refuse to accept Dean Milman's superiors.

verdict on the career of Innocent III., that 'his high and blameless, and, in some respects, wise and gentle character, seems to approach more nearly than any one of the whole succession of Roman bishops to the ideal light of a supreme pontiff;' and that 'in the ideal light of a supreme pontiff, and that 'in him, if ever, may seem to be realised the church-man's highest conception of a vicar of Christ' (Latin Christianity, iv. 277).

Innocent XI. (Benedetto Odescalchi), elected in 1676, was one of the most distinguished among the popes of the 17th century. He was a vigorous and judicious reformer, and his administration is entirely free from the stain of nepotism, which had sullied the fame of many of his predecessors. But his historical celebrity is mainly owing to his contest with Louis XIV., which illustrates as well the personal character of the pontiff, as the peculiar spirit of the age. The dispute began from an attempt on the part of the pope to put an end to the abuse of the king's keeping sees vacant, in virtue of what was called the *Droit de Regule*, and appropriating their revenues. The resistance to this attempt drew forth the celebrated declarations of the French clergy as to the Gallican Liberties. See Gallican Church. But the actual conflict regarded the immunities enjoyed by the foreign ambassadors residing in Rome, and especially the right of asylum, which they claimed not only for their own residences, but also for a certain adjoining district of the city. These districts had gradually become so many foci of crime, and of frauds upon the revenue; and the pope, resolving to put an end to so flagrant an abuse, gave notice that, while he would respect the rights of the existing ambassadors, he would not thereafter receive the credentials of any new ambassador who should not renounce these abusive claims for himself and his successors. The great powers murmured at this threat, but it was with France that the crisis occurred, on the death of the Maréchal d'Estrées. The pope renewed his notice in May 1687. Louis XIV., on the other hand, instructed his new ambassador to maintain the dignity of France, and sent a large body of military and naval officers to support his pretensions. persisted in refusing to grant an audience to the ambassador. Louis, in reprisal, seized on the papal territory of Avignon, and threatened to send a fleet to the coast of the Papal States, but I. was immovable; and in the end, the ambassador was compelled to return with his credentials unopened, nor was the dispute adjusted till the following pontificate. I. died in 1689.

INNOCENTS, HOLY, FEAST OF, one of the Christmas festivals, held in the Western Church on December 28, and in the Eastern on the 29th, under a title similar to that of the Latin festival. lt is intended to commemorate the massacre of the children 'from two years old and upward' at Bethlehem. See Herod. These children are referred to as martyrs by St Cyprian, and still more explicitly by St Augustine; and it is to them that the exquisite hymn of Prudentius, Salvete Flores Martyrum, is addressed. The concurrence of the East and West in celebrating the festival is an evidence of its antiquity. In the modern church, this feast is celebrated as a special holiday by the young, and many curious customs connected with it prevail in Catholic countries. of these is, that in private families the children are on this day privileged to wear the clothes of the elders, and in some sort to exercise authority over the household in their stead. So also, in communities of nuns, the youngest sister becomes for be realised in their integrity. However earnestly this day superioress of the house, and exercises men may dissent from these views, no student of a sort of sportive authority even over the real

INNOMINATE ARTERY (atteria innominacia) is the first large branch given off from the arch of the aorta. It varies from an inch and a half to two inches in length, and divides into the right carotid and the right subclavian arteries. See CIRCULATION, ORGANS or. This artery, through which all the blood to the right side of the head and neck, and to the right arm, flows, has been tied by several surgeons for aneurism of the right subclavian, but the operation has never been successful. An important fact has, however, been established, viz., that the circulation of the blood in the parts supplied by this large vessel, is re-established by Anastomosis (q.v.) after the operation.

INNOMINATE BONE. See PELVIS.

INNOVA'TION, or NOVATION, a name sometimes given in the law of Scotland to the exchange or substitution of one obligation for another. It is in effect taking a fresh security.

INNS OF COURT, the name given in England to certain voluntary societies which have the exclusive right of calling persons to the English bar. There are four such societies in London, viz., the Inner Temple, the Middle Temple, Lincoln's Inn, and Gray's Inn. Each of those inns possesses certain smaller inns, which are mere collections of houses or chambers, as Clifford's Inn, New Inn, Furnival's Inn. &c. The four inns are each governed by a committee or board, called the benchers, who are generally Queen's counsel or senior counsel, selfchosen, i. e., each new bencher is chosen by the existing benchers. Each inn has also a local habitation, consisting of a large tract of houses or chambers, which are in general occupied exclusively by barristers, and sometimes by attorneys, and are a source of great wealth. Each inn is self-governing, and quite distinct from the others, all, however, possessing equal privileges; but latterly, they have joined in imposing certain educational tests for the admission of students. It is entirely in the discretion of an inn of court to admit any particular person as a member, for no member of the public has an absolute right to be called to the bar, there being no mode of compelling the inn to state its reasons for refusal. But, practically, no objection is ever made to the admission of any person of good character. Each inn has also the power of disbarring its members, that is, of withdrawing from them the right of practising as counsel. This right has been rarely exercised, but of late years there have heen examples of persons abusing their profession, and indulging in dishonest practices; in such cases, the inn has its own mode of inquiring into the facts affecting the character of a member, and is not bound to make the investigation public. By this high controlling power over its members, a higher character is supposed to be given to the bar as a budy, than if each individual was left to his own devices. unchecked, except by the law. See BARRISTER.

I'NNSBRUCK (Ger. brücke, a brüdge), capital of the Tyrol, is charmingly situated on the Ina, at the height of 1800 feet above sea-level, in the midst of a broad valley, surrounded by mountains ranging from 6000 to 9200 feet high. It consists of an Old Town, a New Town, and five suburble. The New Town, beautifully laid out, and furnished with broad streets, is united with the older portions of the town by a wooden and a chain bridge across the Ina. The houses are chiefly in the Italian style, four or five stories in height, with flat roots, the first story arcaded, and occupied with shops. The most interesting public building is the Franciscan or Court Church, finished in 1563, and containing the tomb of the Emperor Maximilian I., one of the most splendid monuments in Europe. This

tomb—which, although constructed at the request of Maximilian, and intended for his burial-place, does not after all contain his remains—consists of a marble sarcophagus supporting the emperor's effigy in bronze, in a kneeling posture, while on both sides of the aisle are rows of monumental bronze figures, 28 in number, representing chiefly the principal personages, male and female, of the House of Hapsburg. The other chief buildings are the Museum Ferdinandeum, in which are collections of the productions of the Tyrol in art, fiterature and natural history; and the naiversity (touded in 16-12, and, after several vicisitudes, organized move which, in 18-37, had 211 students and 18 professors. There are also numerous art collections, many interesting churches, and valuable educational and benevolent institutions. I. carries on important manufactures of woollen cloth, silk, gloves, ribbons, and carved work, as well as a flourishing transit trade. Pep. 14,000.

INNUE'NDO, a part of a pleading in cases of libel and slander, pointing out what and who was meant by the libellous matter or description.

INOCA'RPUS (I. edulis), the Mape or Rata of the South Sea Islands, is a tree important to their inhabitants for its fruit, a nut covered with a thin fibrous husk, which supplies a considerable part of their food, and is sometimes called the South Sea Island chesnut. The fruit is pulled in a green state, and roasted. The tree is a very heautiful one, of stately growth and fine foliage; the leaves oblong, six or eight inches long, evergreen, but of delicate texture. It is one of those which, as they advance in age, instead of increasing uniformly in thickness, throw out buttresses to support the trunk. Small projectious first appear, extending in nearly straight lines from the root to the branches, which finally become like so many planks covered with bark. The central stem continues for many years perhaps only six or seven inches in diameter, whilst the buttresses, two or three inches thick, extend from it at the bottom two, three, or four feet. These natural planks are used for paddles of canoes and other purposes.

INOCULATION. If the matter of a variolous (or small-pox) pustule, taken after the commencement of the eighth day, be inserted in or beneath the skin of a person who has not previously suffered from small-pox, the following phenomena are induced: I. Local inflammation is set up; 2. At small-pox; and 3. After the lapse of three more days, there is a more or less abundant eruption of pustules. This process is termed inoculation, and the disease thus produced is denominated inoculated small-pox. The disease produced in this artificial manner is much simpler and less dangerous than ordinary small-pox; and as it was an almost certain ordinary small-pox; and as it was an almost certain ordinary disease, inoculation was much practised till the discovery (about 1766") of the antivariolous power of vaccination.

The importance of inoculation was recognised in the East at a very early period. According to Dr Collinson (Small-pox and Vaccination Historically and Medically Considered, p. 14), the Chinese had practised this process from the 6th c., and the Brahmans from a very remote antiquity. In

four or five stories in height, with flat roofs, this first story arcaded, and occupied with shore. The most interesting public building is the Franciscan or Court Church, finished in 1636, and containing content of the Emperor Maximilian I., one of the most splendid monuments in Europe. This in that year to his master, John Hunter of the most splendid monuments in Europe. This in that year to his master, John Hunter of the most splendid monuments in Europe. This in that year to his master, John Hunter of the most splendid monuments in Europe.

Persia Armenia and Georgia it was in use, and it is even said to have been employed in Scotit is even said to have been employed in Scot-land and Wales. It was not, however, till Lady Mary Wortley Montagu wrote her celebrated letter from Adrianople in 1717, that the operation became generally known in this country. In that letter she writes: 'The small-pox, so fatal and so general amongst us, is here entirely harmless, by the invention of engrafting, which is the term they give it. Every year, thousands undergo the operation. There is no example of any one who has died of it, and you may believe that I am well satisfied of the safety of this experiment, since I intend to try it on my dear little son.' Four years after-wards, she had her daughter publicly inoculated in this country; the experiment was then performed successfully on six condemned criminals at Newgate, and on the strength of these successful eases, 'the critical course was taken of inoculating two children of Caroline, Princess of Wales, which gave

a sanction to the practice.'- Collinson, op. cit. p. 15. Inoculation was not, however, thoroughly established for more than a quarter of a century after its introduction. It met with virulent opposition both from the medical profession and the clergy. A sermon is extant which was preached in 1722, by the Rev. Edward Massey, in which it is asserted that 'Job's distemper was confluent small-pox, and that he had been inoculated by the devil.' The great drawback to inoculation turned out, however, to be this: while it was invaluable to him who underwent the operation, and completely guarded him from the natural disease in its severe form, its effect upon the community at large was extremely pernicious, in keeping alive the natural disease, and increasing its spread amongst those who were not protected by ineculation. While one in five or six of those who took the natural disease died, the average number of deaths at the Inoculation Hospital was only 3 in 1000; and yet, according to the authority of Heberden, in every thousand deaths within the bills of mortality in the first 30 years of the 18th c. (before inoculation was at all general), only 74 were due to small-pox. The deaths from this disease amounted to 95 in 1000 during the last 30 years of the century; so that, notwithstanding the preservative effects of inoculation on almost all who were operated on, the total number of deaths from this disease increased in 100 years in the ratio of about 5 to 4. Moore (The History of Small-pox, 1815) states that, at the beginning of the 18th c., about one-fourteenth of the population died of small-pox; whereas, at the latter end of the same century, the number (not-withstanding, or perhaps rather in consequence of inoculation) had increased to one-tenth; and this immense consumption of human lives was not the total evil, for many survivors were left with the partial or entire loss of sight and with destroyed constitutions. From these remarks, it will be seen that the benefits which were expected from inoculation were far from being realised, and small-pox would doubtless have gone on increasing in its destructive power, if it had not been checked by Jenner's invaluable discovery of VACCINATION (q. v.).

INOFFICIOUS TESTAMENT, a will made whereby near relatives have not been provided for by the testator.

INOWRAYCLAW (called also JUNG BERELH, 'Young Breiau'), a small town of Prussia, in the government of Posen, is situated on an eminence, in a fruitful plain, 26 miles south-south-east of Bromberg. It is an ill-built town; contains many religious edifices; carries on a considerable trade, especially in brewing, distilling, and the manufacture of salpeter; and has a population of 6000.

IN PA'RTIBUS INFIDE'LIUM (Lat., 'in the regions of the unbelievers'). Titular bishops in the Church of Rome have been styled bishops in partibus infidelium since the 13th century. They are actual bishops, who have no diocese, and take their titles from places where there is now no bishop's see, but where there once was. This practice originated after the Greek schism, and became general in the time of the Crusades. The places conquered by the crusaders in the East were furnished with Roman Catholic bishops; but when these conquests were again last, the popes continued to appoint and consecrate the bishops, as a continual protest against the power which had prevailed over their alleged right, and to signify their hope of restitution. same policy has been pursued with regard to Protestant countries. But in Britain, the assumption of territorial titles being illegal and dangerous, the Roman Catholic bishops actually resident have usually borne titles derived from distant places. Thus, the present bishop in Edinburgh is styled Bishop of Limyra. The Roman Catholic bishops in England were similarly designated from places abroad until 1850, when their assumption of titles from their actual sees gave prodigious offence to the Church of England, and led to the passing of the Ecclesiastical Titles Bill, which, however, has been permitted to remain a dead letter.

I'NQUEST. See CORONER.

INQUISITION, in English Law, is the return or report made by a sheriff or coroner as to the finding of a jury on matters inquired into.

INQUISITION, THE, called also the HOLY OFFICE, a tribunal in the Roman Catholic Church for the discovery, repression, and punishment of heresy, unbelief, and other offences against religion. From the very first establishment of Christianity as the religion of the Roman Empire, laws, more or less severe, existed as in most of the ancient religions, for the repression and punishment of dissent from the national creed; and the emperors Theodosius and Justinian appointed officials called 'inquisitors,' whose special duty it was to discover and to prosecute before the civil tribunals offences of this class. The ecclesiastical counizance of heresy, and its punishment by spiritual censures, belonged to the bishop or the episcopal synod; but no special machinery for the purpose was devised until the spread, in the 11th and 12th centuries, of certain sects reputed dangerous alike to the state and to the church the Cathari, Waldenses, and Albi-genses—excited the alarm of the civil as well as of the ecclesiastical authorities. In the then condition of the public mind, however differently it is now constituted, heresy was regarded as a crime against the state, no less than against the church. An extraordinary commission was sent by Pope Innocent III. into the south of France, to aid the local authorities in checking the spread of the Albigensian heresy. The fourth Lateran Council (1215) earnestly impressed, both on bishops and magistrates, the necessity of increased vigilance against heresy; and a council held at Tonlonse directed that in each parish the priest, and two or three laymen of good repute, should be appointed to examine and report to the bishop all such offences discovered within the district.

So far, however, there was no permanent court distinct from those of the bishops; but under Innocent IV., in 1948, a special tribunal for the purpose was instituted, the chief direction of which was vested in the then recently established Dominiean Order. The inquisition thus constituted became a general, instead of, as previously, a local tribunal; and it was introduced in succession into

of France. So long, moreover, as this constitution remained, it must be regarded as a strictly papal tribunal. Accordingly, over the French and Ger-man inquisition of the following century the popes exercised full authority, receiving appeals against the rigour of local tribunals (Fleury, v. 266), and censuring, 'or even depriving,' the inquisitor for unduc severity (ibid. 303). In France, the inquisition was discontinued under Philip the Handsome; and though an attempt was made under Henry II. to revive it against the Huguenots, the effort was unsuccessful. In Germany, on the appearance of the Beghards (see Beguines), in the beginning of the 14th c., the inquisition came into active operation, and iequisitors for Germany were named at intervals by various popes, as Urban V., Gregory XI., Beniface IX., Innocent VIII., down to the Reformation, when it fell into disuse. In England, Reformation, when it fell into disuse. In England, it was never received, all the proceedings against heresy being reserved to the ordinary tribunals. In Poland, though established in 1327, it had but a brief existence. The history of the times of its introduction and of its discontinuance in the various states of Italy, would carry us beyond the limits at our command.

It is the history of the inquisition as it existed in Spain, Portugal, and their dependencies, that has absorbed almost entirely the real interest of this painful subject. As an ordinary trihunal similar to those of other countries, it had existed in Spain from an early period. Its functions, however, in these times were little more than nominal; but early in the reign of Ferdinand and Isabella, in consequence of the alarms created by the alleged discovery of a plot among the Jews and the Jewish converts—who had been required either to emi-grate or to conform to Christianity—to overthrow the government, an application was made to the pope, Sixtus IV., to permit its reorganisation (1478); but in reviving the tribunal, the crown assumed to itself the right of appointing the assumed to itself the right of appointing the inquisitors, and, in truth, of controlling the entire action of the tribunal. From this date forwards, Catholic writers regard the Spanish inquisition as a state tribunal, a character which is recognised by Ranke, Guizot, Leo, and even the great anti-papal authority, Llorente; and in dissociating the church generally, and the Roman see itself, from that state tribunal, Catholies refer to the bulls of the pope, Sixtus IV., protesting against it. Notwithstanding this protest, however, the Spanish crown maintained its assumption. Inquisitors were appointed, and in 1483, the tribunal commenced its terrible career, under Thomas de Torquemada. The popes, feeling their protest unsuccessful, were compelled, from considerations of prudence, to tolerate what they were powerless to suppress; but several papal enactments are enumerated by Catholics, the object of which was to control the arbitrary action of the tribunal, and to mitigate the rigour and injustice of its proceedings. Unhappily, these measures were ineffective to control the fanatical activity of the local judges. The number of victims, as stated by Llorente, the popular historian of the inquisition, is positively appalling. He affirms that during the sixteen years of Torquemada's tenure of office, nearly 9000 were condemned to the flames. The second head of the inquisition, Diego Deza, in eight years, according to the same writer, put above 1600 to a similar death; and so for the other successive inquisitors-general. But Catholics loudly protest against the credibility of these fearful allegations. It is impossible not to see that Llorente was a violent partisan; and it is alleged that in his work on the Basque Provinces,

Italy, Spain, Germany, and the southern provinces he had already roved himself a venal and unscrune ma arcaay roven misseit a venat and unserti-pulous fabricator. Although, therefore, he has made it impossible to disprove his accuracy by appealing to the original papers, which he uimself destroyed, yet his Catholic critics—as Hefele in his Life of Carthiau Ximens—have produced from his own work many examples of contradictory and exaggerated statements; Prescott, in his Ferdinand and Isabella (iii. 467—470), has pointed out many similar instances; Ranke does not hesitate (Fürsten und Völker der Süd. Europas, i. 242) to impeach his honesty; and Prescott pronounces his 'compu-tations greatly exagerated,' and his 'estimates most improbable' (ii. 468). Still, with all the deductions which it is possible to make, the working of the inquisition in Spain and in its dependencies even in the New World, involves an amount of cruelty which it is impossible to contemptate without horror. When it was attempted to introduce it into Naples, Pope Paul III., in 1546, exhorted the Neapolitans to resist its introduction, 'because it was excessively severe, and refused to moderate was excessively severe, and remised to moderate its rigour by the example of the Roman tribunal' (Llorente, ii. 147). Pius IV., in 1563, addressed a similar exhortation on the same ground to the Milanese (ibid. ii. 237); and even the most bigoted Catholics unanimously confess and repudiate the barbarities which dishonoured religion by assuming its semblance and its name.

The procedure of the inquisition deserves a brief notice. The party, if suspected of heresy, brief notice. The party, if suspected of heresy, or denounced as guilty, was liable to be arrested and detained in prison, only to be brought to trial when it might seem it to his judges. The proceedings were conducted secretly. He was not confronted with his accusers, nor were their names even then made known to him. The evidence of an accomplice was admissible, and the accused hunself was liable to be put to the torture, in order to extort a confession of his guilt. The punish-ments to which, if found guilty, he was liable, were death by fire, as exemplified in the terrible Auto da Fé (q. v.), or on the scaffold, imprisonment in the galleys for life or for a limited period, forfeiture of property, civil infany, and in minor cases, retrac-tation and public penance. This form of procedure is strangely at variance with modern ideas; but it is fair to recollect that some of the usages were but the ordinary procedures in all the courts of the age, whether civil or ecclesiastical.

The rigour of the Spanish inquisition abated in the latter part of the 17th century. In the reign of Charles III., it was forhidden to punish capitally without the royal warrant; and in 1770, the royal authority was required as a condition even for an arrest. From 1808, under King Joseph Bona-parte, the inquisition was suppressed until the Restoration: it was again suppressed on the estahlishment of the constitution in 1820; but it was partially restored in 1825; nor was it till 1834 and 1835 that it was finally abolished in Spain, its property being applied to the liquidation of the

national debt. The inquisition was established in Portugal in 1557, and its jurisdiction was extended to the Portuguese colonies in India. The rigour of its processes, however, was much mitigated in the 18th c., and under John VI. it fell altogether into

disuse. The inquisition in Rome and the Papal States never ceased, from the time of its establishment, to exercise a severe and watchful control over heresy, or the suspicion of heresy, which offence was punished by imprisonment and civil dis-abilities; but of capital sentences for heresy, the history of the Roman inquisition presents few

Instances, and, according to Balmez (On Croidnotion, p. 136), that tribunal 'has never been known to order the execution of a capital sentence for the crime of heroey. The tribunal still the section is confined to the examination bedse and the trial of ecclesiatical offences, and questions of church law, as in the recent case of the bay Mortars; and its most remarkable prisoner in recent times was an Oriental impostor, who, by means of forged credentials, succeeded in obtaining his ordination as a bishop. See Liberate's Islavia. Critica de la Inquisicion; Prescott's Ferdinand and Landella; Belede's Der Cardinal Ximanes; eine Biographie; Balmez, Cathelision and Probestantism commercial Relation to Civilianion.

INSA'NITY means all unhealthiness of mind, This consists, according to one opinion, in such disorganisation or degeneration of the nervous structure as to render the exercise of reason impossible : according to another, it consists in disorder of the reason itself; and according to a third, in perversion or destruction of the soul, or the moral part of our nature. The prevailing view of physiologists is, that insanity is a symptom or expression, manifested through the functions of the nervous system, of physical disease. The legal term, lunacy, represents only those deviations from that standard of mental soundness which is universally recognised, the property, or the civil rights may be interfered with. These deviations are, briefly, where the incaare such as to threaten danger to himself or others, and to unfit him for his ordinary business and duties. Insanity is more comprehensive, and includes all states of the feelings and passions, as well as of original and ordinary character and habits of the individual, and with his relations to the family or community of which he is a member. It has been stated broadly, that if a man be deprived of the enjoyment of his religious rights by exclusion from membership of the church to which he belongs; of his civil rights in giving evidence in a court of justice or on oath; and of his personal rights in the management of his property and affairs, he may be regarded as insane; but more correct views of the human mind have led to the belief, that many degrees of feebleness of the faculties, many forms of eccentricity and extravagance, and many defects in the will and moral sentiments, which were formerly regarded as erime and wickedness, but which do not involve such deprivation, may be classed under the same designation. Very recently, the and now includes various degrees of moral perversion, morbid habits, and sudden impulses, such as dipsomania and homicidal mania. The great divisions of this class of diseases into mania, much the same as they were 2000 years ago. this fact may indicate that such a classification has a foundation in nature, it has, unfortunately, tended to render the treatment, or rather the maltreatment, of the insane as stationary as the view of the diseases under which they labour. The following arrangement may serve to explain what insanity is, as well as what it appears to be.

APPETIONS OF THE INTELLETTAL POWERSplices, the non-development of one or more facultics. Imbecility, the imperiest development of one or more faculties. Fatuity, or Dementia, the deprication by disease, or age, or otherwise, of powers which have been developed. Monia, with debusion, excitement, and irregular action of all, but especially

of the intellectual powers; accompanied also by errors connected with the special senses,

APPECTIONS OF THE SENTIMENTS—Melancholia exaltation of grief, penitence, and mixity. Memomania of Pear, exultation of cuntionsucss. Monomania of Superstition, exaltation of the sense of devotion and the marvellous. Monomania of Suspicion, exultation of jednovy, envy, want of confidence. Monomania of Vanity, explantation of craving for applause, grandeur, of feeling of ambition.

AFFECTIONS OF PROPENSITIES.—Dipsomania, incontrollable enving for stimulants. Homicidal Mania, impulsive desire to destroy life, Kirptomania, incontrollable desire to acquire.

This catalogue is not intended to be exhaustive. The departures from health will correspond not merely with the primitive mental powers and instincts, but with every possible combination of these, and with such complications as may result from hereditary predispositions, imate peculiarities, education, and habit.—Dr Combe On Derungement, Coplanul's Dictionary, art. 'Insanity.'

For the disposal and treatment of the insane, see

INSCRIPTIONS, a term applied to all writings engraved or written on objects or monuments not of the class of books, principally on hard materials, such as metals, stones, and other substances. They are a class of documents of the highest interest and importance to history and philology, and a consideration of them embraces the whole scope of history, language, and art. The oldest (excepting those of in the Pyramids (see Pyramids), of about 2000 B. C.; to which succeed those of Assyria and Baby-lonia, reaching nearly as high an antiquity (see CUNEIFORM CHARACTERS); which are succeeded by the Persian and Median, 525 B. C., and along with which prevailed the Phonician, probably about 700 B.C. (see Phenicia); which were in their turn succeeded by the Greek, between 500 and 600 B.C., or even earlier; which were succeeded by the Etruscan and Roman, in 400-30) n.c., and continued through the middle ages in Europe to the present day. See Paleography. In the East, the oldest inscriptions are those of China, which ascend to 2278 B. C.; those of India not being older than 315 B.C., or the age of Sandracottus; while the antiquity of the hieroglyphical inscriptions of Central America cannot be determined. Of many ancient nations, the history and language are found in inscriptions only, as in the case of Lycia and Etruria, and all official inscriptions have a certain authority, from their contemporaneous nature, and the care with which they were executed.

Before the invention of paper or other light substances for the record of events, public acts, devations, and other documents were inscribed on foronz, as the early treaties and dedications of the Greeks, or even lead, as certain small rolls of imprecation and others found in Greece; gold plates were inscribed and placed in foundations under the temples, as that of Canopas shews; the exequaturs of consuls among the Greeks, and the discharges of the Roman soldiery, were inscribed on brouze tables; while charms, annulets, and other formulae were coasionally insertibed on metals. The numerous inscriptions known, probably amounting to half a million, have been classed under public or official acts, tables of unsgistrates, military titles, lists of magistrates, those relating to the gymnassia or games, hanours readered to emperors or men, donations, rites, private and sepulchral, comprising critaples, some in degice and hereic verse, and sumerous minor inscriptions of gens, vases, and

other objects of ancient art, on wax tablets or pugillaria, and the scrawls discovered on the walls of public and private edifices, as at Pompeii and elsewhere. The study of the letters and their form will be seen under Alphaber; that of the different languages and the mode of deciphering, under their respective heads. Those found upon coins will be mentioned in NUMISMATICS. The most remarkable inscriptions are the trilingual inscription of Rosetta, that of Shalmanazer on the obelisk of Nimrud, and the cylinder of Sennacherib; the trilingual inscription of Darius I. on the rock at Behistun; the Greek inscription of the soldiers of Psammetichus at Ibsamboul, and of the bronze helmet dedicated by Hiero I. to the Olympian Jupiter; the inscription on the coffin of the Cyprian king Asmamazer; the Etruscan inscription called the Engubine Tables; that of Mummius, the couqueror of Corinth, at Rome, and the will of Augustus at Ancyra; the inscription of the Ethiopian monarch Silco; the old monament of Yu, and the inscription of Se-gan-fu, recording the arrival of Christianity in China (631 A.D.); the inscriptions of Chandra-gupta and Asoka in India. The study of inscriptions is so difficult, that it has formed a special branch of scholarship, such as decipherment for those of which the language has been lost, or epigraphy for the dead languages. Special collections of the inscriptions of different localities, and general ones, inscriptions of different localities, and general ones have been made of those in the same languages as Assyrian, Greek, Etruscan, Oscan, and Latin, by Gruter, Muratori, Böckh, Franz, Orellius, Momm-son, Letronue, Lebas, and others. Inscriptions have also engaged the scholarship and attention of the most accomplished philologists with various success, from the end of the 17th century. They have been forged by Fourmout and others.— Gruter, Thesaurus Inscr. (fo. 1603—1663); Muratori, Novus Thesaurus (4to, 1739); Kellerman, Spec. Epigraph. (1841); Mommsen, Inscript. Neapol. (fo. 1852); Böckh and Franz, Corpus Inscript. Græc. (fo. 1828—1851); Osann, Sylloge (1822); Lepsius, Inser, Umbr. et Osc. (1841); Gesenius, Script, Ling. Phoen. (1837); Garucci, Graffiti (1856).

INSECTI'VORA (Lat. insect-eating), in Cuvier's system of zoology, one of the divisions of the mammalian order Carnaria (q. v.). None of the I. are of large size; most of them are small timid creatures, generally nocturnal in their habits, and useful in the economy of nature chiefly in preventing the undue increase of worm and insect tribes. Although many of them are not exclusively insectivorous, all of them have the summits of the molar teeth beset with small conical tubercles, as for the pur-pose of breaking up the hard coverings of insect pose of breaking up the hard coverings of insection prey. Their dentition is otherwise very different in the different families. Their legs are short. They all place the whole sole of the foot on the ground. The spout is generally elongated. The families of Talpidæ (Moles, &c.), Soricidæ (Shrews, &c.), Erinaceadæ (Hedgehogs, &c.), and Tupaidæ (Banxrings) are referred to insectivora. The I., although in are referred to insectivora. some respects very different from the Cheiroptera, exhibit an affinity to them in others.

INSECTS (Insecta), one of the classes of Articulata (q. v.), or Articulated Animals, of the division having articulated members. All the Articulata having articulated members were included by Linnæus in the class of I.; but the Crustacea and Arachnida were soon separated from it, and afterwards the Murianoda. See these heads. This afterwards the Myriapoda. See these heads. This restricted application of the term I. corresponds more nearly with its popular use, and so well accords with its derivation, that it may be regarded as one of the most appropriate names employed in natural

history. It is from a Latin word, signifying cut into; a derivation exactly answering to that of the Greek entoma, from which the science having insects for its subject receives the name of Entomology. Insects, a natural and extremely well defined class of organised beings, are remarkable, in their mature or perfect state, for the division of their bodies into three very distinct portions-the head, thorax, and abdomen; the divisions being often so deep, that the slenderness to which the body is there reduced cannot be contemplated without admiration.

The body of an insect, as of all the other Articulata, is composed of a certain number of rings. One of these forms the head; or, if the head ought to be regarded as really composed of several rings, modified and condensed together, as the skull of vertebrate animals is formed of modified vertebrae, yet no distinction of rings appears. The eyes, the antennæ, and the organs of the mouth, are the most conspicuous organs connected with

the head.

The thorax is formed of three rings, closely combined, but easily distinguishable. The first is the prothorax; the second, the mesothorax; the third, prothorax; the second, the messanorax, the survey the metalhorax (Gr. pro, before; mesos, middle; and meta, after). Of these rings, one or another is often remarkably developed. The legs and wings are attached to the thorax. Insects have six legs, and generally four or two wings, never any other number; but some are wingless, and this is the case not only in all the insects of certain groups, but also in particular species of groups ordinarily winged, and is sometimes even a distinction of sex, as in the glowworm. The first pair of legs are attached to the prothorax; the second, to the mesothorax; and the third, to the metathorax. The first thorax; and the third, to the metathorax. The inst-pair of wings are attached to the mesothorax; the second, to the metathorax. In dipterous (we winged) insects, the place of the second pair of wings is occupied by two small organs—bit-threads, terminated by a knob—called balancers (ballers), the use of which is not well known. The The abdomn consists of uine segments, or of The abdomn consists of uine segments, or of

fewer; as some are often obliterated, or modified, to form various appendages. It contains the prineipal viscera. In it, the sexual organs are situated. The rings of the abdomen are much more separate and movable than those of the thorax. terminal rings of the females of some groups form an oviduct or ovipositor, which is sometimes capable of being employed as a borer, to make a place for the eggs in the animal or vegetable organism destined to receive them, and which in

wasps and bees is replaced by a sting.

The nervous system of I., in all their stages of

existence, exhibits the general characters noticed as belonging to the Articulata (q.v.). There is a brain, or ganglion of the head, from which arise the nerves of the eyes, antennæ, and mouth. The rings of which the hody of an insect is com-

posed appear most distinctly in the external cover-ing. This is in most parts hard, but more or less flexible, of a horn-like substance, chiefly composed of Chitin (q. v.). The external covering of insects is the principal framework of their bodies, and to it the muscles are attached. The external covering of the muscles are attached. The external covering of each ring is more or less distinctly divided into two parts—a dorsal and a ventral—the connection at the sides being effected by a softer and more flexible membrane, a still softer membrane con-necting the rings of the abdomen, so as to allow considerable irection of motion; whilst between the rings are minute pores called stipnate or spiredex, hy which air is admitted to the trachea or air-tubes (q. v.), the organs of respiration.

Insects respire neither by means of lungs nor of

cills, and the blood is not brought to a particular part of the body for aëration, as by circulation in air which enters by the breathing-pores is conveyed by tubes to all parts of the body, and even through the delicate structure of the wings, so that the whole frame is rendered more light by the very means employed to maintain and increase muscular energy. Respiration is extremely active in insects; they consume a great quantity of oxygen in pro-portion to their size, and they display, in general, an extraordinary degree of activity and muscular energy. The flight of very many kinds is far more rapid in proportion to their size than that of birds; others display a similar superiority of powers in running, swimming, or digging and burrowing; whilst the leaping of many, as fleas and grass-hoppers, and the springing of others, as cheesehoppers, and the springing of others, as eneeschoppers, prodigiously exceeds anything of which any vertebrate animal is capable. The respiration of aquatic insects takes place in the same manner as that of other insects, and they come to the surface of the water for fresh supplies of air.

The blood of I. is thin and colourless. everywhere enclosed in vessels, but is freely diffused and in the visceral cavity. It contains globules or corpuscles of determinate shape. How far the dursal ressel (see Articulata) should be regarded as a heart, is not fully determined; but by its contractions and dilatations, a constant motion of

the blood is maintained.

The members of I. have generally a structure analogous to that of the trunk, in being composed of articulations, the hard and solid part of which is the external covering. This appears very perfectly in the legs, the antennæ, and the palpi, but not in the wings.

The legs of I. consist of two principal parts, the thigh (femur) and shank (tibia), with two

Various Forms of Insects' Feet, shewing the adhesive Discs or Suckers (highly magnified). (Copied from Rymer Jones's Animal Kingdom.)

one of the middle pair of legs of Water-beetle; B, foot of Ribio febrius; C, foot of House-By; D, leg and foot of Cymber lutea; E, tarsus of Abssinian Gras-hopper, shewing hooks or leaping appendages; F, one of the anterior legs of

smaller articulations, the coxa and trochanter, interposed between the body and the thigh, and at the extremity of the shank, a set of three, four, or five small articulations, called the turnus. The last segment of the tarsus in terrestrial insects is generally terminated by a pair of hooks or little claws; and many dipterous insects, as the House-fly (q, v.), have discs and suckers for taking hold of smooth

The wings of L are often very large in proportion to the size of the hody, and the rings of the thorax are soldered together, and supported by supplementary pieces, to give firm support to them, and to the powerful muscles necessary for their action. The hard covering of the body of an insect consists, like the skin of vertebrate animals, of three lavers. and the membranes of the wings are filmy expansions of the outermost of these, the epidermis. The ribs or nervures in the wings of I. are tubes, of which one of the uses is the conveying of air even to the extremities of the wings. The forms of the wings are very various; some of the more important diversities being characteristic of different orders. The bodies of I. are often very much covered with hairs, which are often very long and thick in proportion to the size of the animal, and on the wings of butterflies and other Lepidoptera are flattened and expanded so as to form scales (see BUTTERFLY), often richly coloured, and also, by reason of very fine parallel strize, with which they are marked, displaying an admirable iridescence or reflection of evanescent prismatic colours in changing light. The first pair of wings in colcopterous I. or beetles is represented by a pair of hard chitinous elytra (Gr. coverings), or wing-covers, Orthopterous I. have softer leathery or parchment-

Insects feed on very different kinds of food; some prey on other I., some devour animal, and some vegetable substances, some suck the juices of animals, some the juices of plants or the honey of their flowers. The structure of the mouth varies accordingly, and the digestive organs also vary. The mouth is either adapted for gnawing, cutting, and tearing, or merely for sucking, or it is adapted partially for both of these purposes. The parts of a mandibulate mouth are figured to the article Coleoptera, and are an upper lip (labrum) and an ander lip (labium), moving vertically; and an upper pair of jaws or mandibles (mandibula) and a lower pair of jaws (maxilla), moving horizontally. The upper and under lip meet when the mouth is shut. Both are as hard as the jaws. The lower lip is sometimes regarded as consisting of two parts, called the chin (mentum), and the tongue (lingua), which is more membranous and fleshy, and reposes on the inside of the chin. The upper jaws or mandibles are usually powerful, and often strongly toothed and hooked, sometimes furnished with cutting edges like sharp scissors, and sometimes adapted for bruising and grinding. They are also the instruments which bees and other I. use for their wonderful operations of cutting, tearing, building, plastering, &c. The lower jaws or maxillae are generally less powerful. In some I., in which the mandibles are enlarged into great organs of prehension, the maxillæ alone serve for the ordinary use of jaws in eating. To the maxillæ and the lower lip are attached organs called palpi or feelers, consisting of a number of minute articu-lations, supposed to be delicate organs of touch connected with the purposes of the mouth, and dustinguished as maxillary palpi and labid palpi. The mouths of mandibulate L are sometimes

called perfect, and those which exhibit a different character, imperfect. The terms, however, are improper each kind is perfect, according to the purposes for which it is to be used. Yet a correspondence of structure may be traced, so that the parts of the mandibulate mouth may be recognised under various and very remarkable modifications

in the mouths of I. which live by suction, the filaments which form the probescis of butterflies the consequent fertilisation of eggs, that in some, are the maxille excessively lengthened, and the cutting parts of the mouth of the flea are the mandibles and maxillæ. The proboscis of flies represents the lower lip.

The alimentary canal of L is usually more or less convoluted. Between the mouth and the proper digestive stomach, it sometimes exhibits a crop (honey-bag of bees) in I. which live by suction, and this is either a dilatation of the lower part of the gullet or a lateral vesicle; sometimes a gizzard, with muscular walls, often armed with horny pieces, for trituration of food. The stomach is of a very elongated form. The liver is represented by long slender bile-tuhes, four or more in number, which wind around the intestine, and pour their secretion into it, where it originates from the stomach. The salivary glands are generally similar tubes.

Section of the Eye of a Cockchafer (highly magnified): Section of the eye or a concentrate unput magnitude, A, section: a, optic gargion, into which the optic nerve swells; b, nerves arising from its surface, and proceeding to the general tertina; c, general retina; c, diverse of the individual of the general retina; c, optic nerves of the individual eyes which form the compound eye. B, a group of these, much magnified; f, bails of optic nerve; g, larger of pigment; h, vitreous humour; i, corne

The eyes of I. are of two kinds-simple or stemmatic, and compound or composite. See EYE. Some I. have only simple eyes (ocelli), some have only compound eyes; but the greater number have two large compound eyes on the sides of the head, and three small simple eyes between them. Compound eyes occur in I. only in their mature or perfect state;

the eyes of larvæ are simple. The Antennæ (q. v.) are generally regarded as organs of touch. They are attached to the head, in front of the eyes, and are always present, and always two in number. They exhibit a vast variety of different forms, some of which are figured in the following cut. I. make much use of their antennæ to investigate surrounding objects by contact, although, if this is their sole use, it is not very easy to assign any probable reason for some of their forms; but there is not much plausibility in the conjectures which assign to them a part in the exercise of the senses of hearing and smell, although these senses and taste are evidently enjoyed by L, or at least by many I. in great perfection, and their particular seat and organs are not well ascertheir particular sear and organs are not we ascer-tained. The sense of smell appears to be of great importance to I. in guiding them to their food. The sexes are distinct in all I., and very remark-able differences are often exhibited by the males and females of the same species, in size, colour, and the form and structure of parts that have no immediate connection with the reproductive system. What are called neuters in some tribes are imper-fectly developed females. The connection of the

Thus a remarkable provision is made in the female for

Various Forms of Antennæ (Copied from Roget's Animal Physiology.)

as bees, continue for a long time afterwards to be successively developed.

Insects are generally oviparous; a few are ovo-viviparous. The Aphides afford an instance of what has been called the Alternation of Generations. The greater number of L take no care of their eggs after depositing them, and many themselves pass out of existence before the eggs are hatched; the chief part of the lives of I, being generally spent in their immature states, and their brief existence in a perfect state serving mainly for the propagation of their species. Thus many insect tribes disappear entirely on the approach of winter, their eggs awaiting the warmth of spring or summer to he hatched. The case is very different, however, with bees, ants, earwigs, and some others, which carefully tend and rear their young.—The number of eggs laid by I is very various, but often very great. The flea, indeed, only lays about twelve, and many dipterous and coleopterous insects about fifty; but the silkworm produces from 500 to 2000; a single queen bee is supposed to lay 40,000 or 50,000 in a eason; and the female termite or white ant, laying about sixty eggs in a minute, and for a period of very considerable though unknown duration, exceeds as to the number of her eggs any other known animal in the world.

The eggs of I. are generally white, yellow, or green; they are of very various shapes-round, cylindrical, conical, lenticular, &c.; they are sometimes smooth, sometimes beautifully sculptured.

The stage of development at which I. come forth from the egg is very different in different tribes: in some, they appear as footless worms; in others, they have rudimentary feet, but still with very little power of locomotion; in others, besides little claws representing the six feet of the perfect insect, there are on the abdominal segments of the worm-like body ficshy tubercles serving as feet; in others still, the legs are well developed, and the insect, on issuing from the egg differs little from the perfect insect, except in the want of wings; whilst, finally, in a comparatively small number (lice, &c.), there is no obvious difference except in size. Similar differences of the degree of development appear in the mouth, eyes, and other organs, Hence the subsequent changes by which the mature fectly developed females. The connection of the state is reached are very different in degree; and L. sexes takes place only once in the lives of L. and being primarily divided into those which undergo

and those which do not undergo metamorphosis, existence is not comprised within a single year any conservance on or undergo metamorphoses, existence is not comprised within a single year some of the former are commonly spoken of as spending the winter, as very many I of temperate nucleogoing complete, and others incomplete meta-climates also do, in a state of torpolity. All morphosis: In the first state of insect life, the L are every found of heat, and many which do insect is called a Learn (q, v). Grules, caterpillars, not become completely torpol in cold weather, and magnets are the larve of different orders of become partially so, I is only in warm weather insects. From this state it passes into that of a that I. display their greatest activity. As to Pages (q, v), or nymin—a chapsais or overdie is their geographical distribution, I are found in all the pupa of a lepidopterous insect - and finally it

becomes an imago, or perfect insect.

The metamorphoses or transfermations of I. have always been regarded with great admiration. A worm, inhabiting a muddy pool, becomes a winged creature that sports in the air. A crawling caterpillar, that ravenously devours some kind of herbage with its horny jaws, eating vastly more in proportion to its size than an ex, is converted into a splendid butterfly, flitting from flower to flower, and feeding only on nectareous juices. The intermediate or pupa state only adds to the wonder. The caterpillar, after several moultings, or changes of skin, and when it has attained its utmost size, ceases from eating, perhaps fixes itself under a leaf, becomes incased in a horny covering, as in a second or a butterfly. Many larvæ, also, when about to change into the pupa state, spin Cocoons (q.v.), in which they envelop themselves, by means of spinnerets on the under lip, through which a viscid secretion passes in fine threads which harden into silk. But whilst the pupe of many I. are motionless, or nearly so, and eat no food whatever, the pupe of other L, as dragon-flies, are active and voracious. The intermediate or pupa state often differs little from the larva state, except in the possession of wings, or from the perfect state, except in the wings being merely rudimentary and still unfit for flight.

An opinion at one time prevailed, that the successive envelopes of the larva were all contained from the beginning within the first, within them the covering of the pupa, and within it the perfect insect. This extraordinary fancy has given place to the belief, established on sufficient observation, that the envelopes which the growing larva successively casts off, are merely a hard, thick, extravascular and unextensile epidermis; that the jaws, claws, &c., of the larva, with which it parts when it becomes a pupa, in the case of I. undergoing complete metamorphosis, are connected with the epidermis; and that the covering of the pupa is a new secretion. Discoveries, however, do not render less marvellous, but only more admirable, the changes which take place. Of these, some of the most important are in the organs of the mouth, the

digestive organs, and the nervous system.

It is not certain that any insect has a voice or cry, although the origin of the sounds produced by some of them, as the plaintive, squeaking note of the death's head moth, is not known. The sounds of which we do know the origin are not produced by the mouth or throat. See Grasshopper, Death-watch, and Cicada.—The humming or buzzing of I. during flight has been commonly ascribed to the extremely rapid vibrations of their wings. Burmeister, however, supposes it to be produced by vibratory laminæ in the respiratory spiracles of the thorax, acted upon by the foreible emission of air during the violent muscular action

Insects are all animals of small size, and many of them are minute. The largest species are tropical, and I. of all sizes abound in warm far more than in cold climates. The I. of the polar regions are comparatively few, and are to be seen only during summer; those of them whose whole

countries, to the utmost alpine and polar limits of vegetable life. Many kinds are peculiar to parti-cular climates and countries. The L of the Malayan Archipelago and of Australia, like their other natural productions, are generally very different from those of other parts of the world. The I. of elevated mountainous regions within the tropics generally resemble those of the temperate and generally resemble those of the temperate and frigid zones, but are seldom the same. The multi-tude of species of I is very great. The species of coleopterous I alone, or beetles, are more numerous than all those of vertebrated animals together.

A few I, are important for their usefulness to man, and a greater number for the injuries which they inflict. Of the former, bees and silkworms deserve to be first named; and after them the cochineal insect and cantharides or blisteriog-flies. There are a few others to which we are indebted for substances useful in medicine and the arts, as kermes, lac, galls, &c. Of the injuries inflicted by I., the most serious are those caused by the destruction of herbage and crops, as by the ravages of locusts, of some kinds of caterpillars, and of numerous tribes of coleopterous and dipterous insects. See Corn-fly, Turnip-fly, &c.

insects. See Corks-FLY, Terker-FLY, &c.

The primary division of I, into those which do not and those which do undergo metamorphosis (Ametabolia and Metabolia of Leach), has been already noticed. The former are divided into the orders Thysamura (q. v.) and Parasita (q. v.) or Anoplura, and are all included in the order Aptera (see Apterous I.) or wingless I. of Linnaus. The insects undergoing metamorphosis, which are far more numerous, are divided into two great groups, Mandibulata and Haustellata, the former having the mouth fitted for mastication, the latter for suction. The Mandibulata form the universally recognised orders Coleoptera, Orthoptera, including Dermoptera of some entemologists, Neuroptera, and Humenoptera: the Haustellata form the orders Hemiptera, including Homoptera of some, Lepidoptera, Strepsiptera, Diptera, and Suctoria (Aphaniptera of

See these heads. Fossil Insec's. - Several causes conspire to make the remains of I. in the stratified rocks comparatively rare, such as their possession of the power of flight, their soft and speedily decomposing bodies, and the extent to which they are preyed upon by other animals. That they were abundant during some periods is, however, very evident. In the Lower Lias, several bands of limestone occur, which, from the abundance of insect remains contained in them, have been called 'insect limestone, Tanget in them, and been cancer insect emissione. They are crowded with the wing-cases of several genera of Coleoptera, and I., almost entire, are frequently found. The strongly nerved wings of sooic Neuroptera are beautifully perfect. In the Eoceae strata, at Auvergne, a considerable thickness of limestone is formed entirely of the indusia or of limestonic is formed charge of the induced of cases of the aquatic larva of a neuropterous insect.

Amber from Tertiary strata often abounds in 1, captured and enclosed while this petrified gum was in its primitive fluid condition, and now made permanent in the transparent stone, with every minute detail of structure beautifully preserved.

The oldest strata in which insect remains have been observed belong to the Carboniferous period.

The remains consist of fragments of Neuroptera, Orthoptera, and Coleoptera.

The Lower Lias I. belong to various orders; they are generally of a small size, apparently indi-cating a temperate climate. In the Upper Lias, they are not infrequent; a few specimens have been found in the Oolite proper; and in the Wealden, both land and water forms occur. None have been noticed as yet in the deep sea rocks of the Cretaccous period, but in the newer Tertiary strata they are common, especially in the amber from the lignite beds of Germany, and in the cavern deposits. worthy of remark that no new forms have been observed; all are either referred to living genera, or placed in new yet nearly allied genera,

INSESSO'RES (Lat. perchers), or PERCHING BIRDS, an order of Birds called Passerine (sparrowlike) Birds by Cuvier. In respect of the number of species which it contains, it is by far the largest order of the whole class of Birds. Cuvier says: 'Its character seems at first sight purely negative, for it embraces all those birds which are neither swimmers, waders, climbers, rapacious, nor gallin-accous. Nevertheless, by comparing them, a very great mutual resemblance of structure becomes perceptible.' A principal characteristic is found in the structure of the feet, which are particularly adapted for perching on the branches of trees, and have three toes before and one behind, the hind toe on the same level with the others. The legs are neither very long nor very strong; nor are the claws in general very long or very sharp. The wings are often long, and the power of flight very consider-able, but this is not always the case. The neck able, but this is not always the case. The neck is not long. The bill exhibits many varieties in length, thickness, &c., being very short and thick in some, very slender in others, but never exhibits the characteristic peculiarities of the accipitrine beak, although there is an approach to them in the shrikes, which are a connecting link between the two orders. The I. with short strong heaks are principally granivorous, those with slender beaks principally grainvotors, those with stenter bears insectivorous; but very many adapt themselves almost indifferently to both kinds of food. Some feed on pulpy fruits; some on vegetable juices; some chiefly on carrion. The stomach is a muscular gizzard. To the order I. belong the singing-birds, and throughout the whole order a variously complicated structure of the lower larynx prevails. The . pair, but the attachment of the sexes in most of them seems to endure only for a single season. They generally build interwoven nests, and lay numerous eggs. The young are always naked and blind on coming forth from the egg.—The I. are divided into four great tribes or sections, Dentirostres, Conirostres, Tenuirostres, and Fissirostres. See these heads.

INSO'LVENCY, or BANKRUPTCY, is the state of a person declared to be unable to pay his debts. Insolvency is a term which in England has long been confined to the case of a non-trader who was unable to pay his debts. All who were traders (a term which was not always easily defined) were said, in the same circumstances, to be, not insolvent, but bankrupt. Different courts, called the Bankrupt and Insolvent Courts, were applicable respectively to these two great divisions of mankind, traders and non-traders, and the chief points of difference in the procedure were these. In the case of traders, the Court of Bankruptcy was the court to which they or their creditors applied for its summary intervenor their credition. That court, whenever a man who was a trader was unable to pay his debts—certain tests of which inability, called acts of bankruptcy, were assumed as infallible symptoms—on the application tion. That court, whenever a man who was a called the Court of Bankruptov, which, as far as the trader was unable to pay his debta-certain tests London district is concerned, sits in Baninchall of which inability, called acts of bankruptov, were Street, City. The London district includes all the assumed as infalible symptoms—on the application counties near Middlesex within an area of about of a creditor, took foreble possession of his property 100 males. The rest of England is divided into

or his assets of every kind and denomination, converted these into money, and distributed the produce impartially among the creditors, according to certain rules, at the joint expense of the creditors, later course of doing this, the court required the bankrupt to state all the property he had, where it was, and to give explanations as to what had been lately lost; and it was a crime for him to conceal or make away with any part of his property to the prejudice of this impartial distribution. The the prejunce of this impartial distribution. The creditors also came in and proved their debts against his estate, thereby shewing their title to share in it. In this way the debtor was entirely stripped of everything (with a few trifling excepsurplet of everything (with a lew trining excep-tions) which he had, and which was saleable; and, on the other hand, he received a certificate which entirely cleared him of the inenmbrance of his past debts for ever—freed him not only from imprison-ment, but even from the liability to pay more in future, should he afterwards become rich; and he could thus begin the world anew.

On the other hand, the non-traders, who consisted of country gentlemen, professional men, gentlemen at large, and nondescripts of every degree who were not traders, fell under the care of the Insolvent Court. These non-traders petitioned the court voluntarily, instead of their creditors doing so, as was the case in the Bankrupt Court, and they of conrse put off this application till the last, when they were in prison, though they might also petition before any creditor put them in prison. The sole condition on which the Insolvent Court granted them its protection, and discharged them from prison, was, that they should not only give up all their property, but state fully all the debts and liabilities they had incurred. If they did this satisfactorily, the court relieved them from imprisonment, which was the most obnoxious of their terrors, but did not entirely free them from the debt they had incurred. On the contrary, they were still liable for their debts; and if ever they should in future become rich enough to pay twenty shillings in the pound, they were still held liable to make up that amount. This contingency, however, seldom happened, and, moreover, when it did happen, considerable leniency was shewn to the debtor, so that practically, both in bankruptcy and insolvency, the debtor was more or less whitewashed, and was at least saved from imprisonment.

Recent changes have been made in the English law on this subject, and more are impending. It was originally intended to abolish entirely the distinction between traders and non-traders, to fuse the enactments together, and make all insolvent persons, whether they were traders or non-traders, subject to the same law, as is the case in Scotland, and as has been the case in America since 1841. This intention has not yet, however (1862), been entirely carried into effect in England, though a great deal has been done towards that consummation. The distinction is, therefore, still kept up for several purposes, and it must be admitted that there is a difference in the nature of things between the two

The bankruptcy laws date from the time of Henry VIII., and the insolvency laws from the time of Elizabeth, the distinction as above explained having always been kept up between them till the late statute 24 and 25 Vict. c. 134, passed in 1861. By that statute, the Insolvent Court was abolished. The court now administering this branch of the law is

separate districts, such as Birmingham, Leeds, Manchester, Liverpool, Bristol, Exeter, Newcastle-upon-Tyne. The judges are called Commissioners, and have salaries of £2000 and £1800. The county court judges, except in the metropolis, also have all the powers of commissioners. The other chief officers are registrars, with salaries of £1000, £1200, £1400 -a taxing-master with a salary of £1400, and an accountant in bankruptcy with a salary of £1500. The official assignees are officers with salaries of £1200, £1000, £800, in whom the estate of the bankrupt immediately vests, and who therefore, with the creditors' assignees, manage the bankrupt are now reduced to £500 and £400,

The tests of bankruptcy, or rather the acts done by a trader which make him hable to be proceeded against as a bankrupt, are technically called acts of bankruptcy. These are: departing the realm -remaining abroad-absenting himself from his dwelling-house-keeping (himself prisoner in his) house-suffering himself to be arrested or taken to prison for debt-or allowing his goods to be taken in execution for debt-executing a fraudulent grant. gift, or conveyance of his lands or goods. If a trader execute a conveyance of his whole property to a trustee for the benefit of his creditors, this will be treated as an act of bankruptcy, if any creditor petition within three months thereafter to make him a bankrupt. So, after a petition has been presented, the paying or giving security to any one creditor, so that he shall receive more than the other creditors, is an act of bankruptcy. If any creditor make an affidavit of debt, and give notice to the trader requiring immediate payment, the Court of Bankruptey may order this to be filed, and call on the trader, if he do not bond fide dispute the debt, to enter into a bond with sureties to pay it in a given time, and refusal or neglect to attend or to pay this, is an act of bankruptcy. With regard to a non-trader, the acts of bankruptcy are these : if, with intent to defeat or delay his creditors, he depart the realm, or remain abroad, or make a fraudulent gift, conveyance, or transfer of his real or personal estate; but in these cases the court will not declare him bankrupt until it is shewn that he has, whether abroad or not, been personally served with notice of the intended application, or at least that every reasonable effort has been made to effect such personal service; that is to say, to put into his hands written notice and full information of what is intended against him. Other acts of bankruptcy, which are apl licable to both trader and non-trader alike, are the lying in prison for debt-suffering his goods to be taken for debt filing a declaration in the Court of Bankruptcy that he is unable to meet his engagements, provided a petition for adjudication of bankruptcy be filed against him within two months thereafter. It thus appears that a person may be made bankrupt either on his own petition or on the petition of any creditor, after one or other of these acts of bankruptcy has been committed.

The mode in which an adjudication in bankruptcy is conducted in England is as follows: The set of bankruptey, as already explained, must have occurred within twelve months before the proceeding is comwithin tweete months step is a petition to the court. The first step is a petition to the court. This may be presented either by the debtor or a creditor. If, as is most usual, it is presented by a

of two creditors amount to £70, they may jointly petition; or if the debt of three creditors amount to £100, they may jointly petition. Such debts may be due under mortgages, securities, or liens, and the costs and interest previously due in respect of such debts count as part of the whole debt. If a person in prison for debt is too poor to pay the fees, he will be allowed to present the petition against himself in forma pauperis; and as a monthly return of all debtors must be forwarded to the Bankruptcy Court. if prisoners remain beyond a limited time viz., if traders beyond a fortnight, and if non-traders beyond two months-without voluntarily petitioning, the court will compulsorily make them bankrupts, and deal with them accordingly, including the power of releasing them from prison. On the petition for adjudication of bankruptcy being presented, together with an affidavit of the debt, it is filed in court, and on proof of the trading and act of bankruptcy, the court adjudicates the debtor a bankrupt. court then appoints an official assignee to taks possession of the property and premises. Before the adjudication is advertised in the Gazette, the debtor is to have notice personally, or by service, at his premises, and a certain number of days, from seven to fourteen, are allowed to him to shew cause why the adjudication should not be deemed valid. The bankrupt is then to deliver up all his books and papers on oath to the official assignce. He is bound to give information to the official assignee and the court, and to attend from time to time for that purpose, and he is allowed remuneration for that purpose. A small sum is also allowed for his and his family's maintenance during the proceedings, In general, the bankrupt from this time to the end of the proceedings is free from being arrested by individual creditors, and receives a protection from the court. The petitioning creditor, at his own costs, prosecutes the petition up to the stage when the creditors choose their assignees, when these costs are repaid to him. Soon after adjudication of bank. ruptcy, a ten days' notice is given in the Gazette to the creditors to meet and appoint assignees. On this occasion, the creditors must first prove their debts, which they do by their affidavit or oath, together with production of any security or document verifying the debt. All creditors having thus proved whose debt exceeds £10, have power to choose one or more persons as creditors' assignees; but the court has power to reject such choice, if unfit. The creditors may be represented on such occasion by an agent or deputy, whose authority needs no stamp, Treditors may determine whether such assignee shall give security. The court declares the appointment final. From the moment of their appointment, the whole of the bankrupt's real and personal property of every kind vests in them. They can sell it, and in general do everything which the bankrupt himself could have done. They are accountable to the creditors, and must render quarterly accounts to the official assignee, which accounts must be printed and sent to every creditor. They manage and realise the estate and collect the debts, except those under £10, which the official assignee collects. The court can summon the bankrupt, his wife, and all persons for examination. A sitting is appointed for the last examination of the bankrupt, when he must prepare a statement of the accounts for the satisfaction of the creditors. Meanwhile all creditors who have debts must complete the proof, Every creditor may prove his debt by delivering, or sending through the general post, to the official assignec—or, if the creditors' assignee has been appointed, then to the latter-a statement of such creditor, then such creditor must have a claim of debt, and of the account of any, and a declaration debt amounting to not less than £50; or if the debt signed by such creditor appended thereto that such

statement is a full, true, and complete statement of of all his estate both real and personal assignable account, and that the debt is justly due. If the debt is undefined, and consists of unliquidated damages, then the court orders a jury to be empannelled, either before itself or a court of law, to fix the sum. Debts which have been incurred, but are payable at a future time, may also be proved, and so may con-tingent debts and liabilities. When wages are due to clerks and servants at the time of the bankruptcy, the court may order a sum not exceeding three months' wages, and not exceeding £30, to be paid in cash; and for any surplus that may be due, the clerk or servant must prove and share with the other creditors. If the other creditors oppose a particular debt, and shew it is unfounded, the court will expunge it. When all the examinations neceswill expunge it. When all the examinations sary of the bankrupt have been gone through, a day is appointed for considering his discharge. court allows creditors to oppose this step; and if it appear he had traded with fictitious capital, or had no reasonable expectation of being able to pay the debts he contracted, or if his insolvency was caused by rash and hazardous speculation, or unjustifiable extravagance in living, or if he vexatiously put his creditors to expense, the court may either refuse or suspend for a time the discharge, or may grant an order of discharge subject to any condition as to salary, pay, emoluments, profits, wages, earnings that may afterwards become due, and touching afteracquired property, or may sentence the bankrupt to acquired property, or may sentence the bankrupt to be imprisoned for any period not exceeding one year. If the discharge is granted, no classification of certificates is awarded, as formerly; but in case of a suspension or sentence to imprisonment, the discharge shall simply state such facts and the reasons. The effect of the discharge is to free the bankrupt entirely from all debts capable of being proved under the bankruptcy. The creditors have it in their power to determine whether any and what allowance should be made to the bankrupt up to and upon his discharge.

It, after an adjudication of bankruptcy has issued against a debtor, three-fourths of the creditors at their first meeting resolve that the estate ought to be wound up under a deed of arrangement, composition, or otherwise, the court, if it appear such course will be beneficial to the creditors, is bound to confirm such resolution, and stay the proceedings. So if the debtor enter into a deed with his creditors for winding up his business, it shall be valid and binding on all the creditors if executed by three-fourths in value of the creditors above £10, and if the debtor's solicitor attested the same. Such deed is to be registered in the Court of Bankruptcy, and the court has jurisdiction in most respects as regards the carrying out of the deed.

United States. The Bankrupt Act of 1800 was substantially for creditors only, and was derived from the English statutes. The law of 1841 was for the benefit of debtors, and its existence was but short-lived. The third Bankrupt Law of Congress was passed March 2d, 1867. Under this act any person residing within the jurisdiction of the U. States may petition in the district where he 'has resided or carried on business for the six months next immediately preceding the time of filing such petition, or for the longest period during such six months.'

States. Such debts may be mortgages, pledges, liens, Laws, 1870. judgments or collateral or other security given for the

under this act, describing the same, stating where situated, whether incumbered, and to what amount. The filing of such a petition is an act of bankruptcy, and the petitioner deemed a bankrupt, provided that before any proceedings thereon he has taken and subscribed to an oath of allegiance and fidelity to the United States. If no opposing party appear, and the proceedings are satisfactory, the marshal of the district is authorised by warrant from the judge or register to pub-lish notices in such papers as the warrant specifies, to serve written or printed notices by mail or personally on all creditors, filed with the debtor's petition, &c., forbidding payment of any debts or delivery of goods or property to such debtor, and appointing a time for a meeting of the creditors at a court of Bankruptcy to prove their debts and choose one or more assignees, at a time not less than 10 nor more than 90 days after the issuing of the same. At the first meeting the greater part in value and number of the creditors who have proved their debts are to elect one or more assignees, but if they omit to make a choice, if there be any dissension the judge may appoint the assignee, and if there be no opposition, the register may appoint one. The assignee may be required to give security in good and sufficient bond to the U. States for the faithful performance of his duties. The property of the bankrupt is then transferred by the register, if there is no opposing interest, to the assignee, with all his books and papers relating thereto, excepting the necessary household and kitchen furniture, and such articles as are set apart, but not in any case to exceed \$500, the wearing apparel of the bankrupt, of his wife and children, and such property as is exempted from levy and sale or execution, &c., by the laws of the state, in 1864, in which he resides, with sundry other exceptions. Strict regulations are established design nating the manner in which creditors may by proving their debts entitle themselves to a share of the distribution, which must be made pro rata, without any priority or preference whatever, except that wages due from the bankrupt to any operative or clerk or house servant, to an amount not exceeding \$50, for labor performed within six months next preceding the adjudication of bankruptcy, shall be entitled to priority, and shall be paid in full. At any time after the expiration of six months from the adjudication of bankruptcy, or if no debts have been proved against him and no assets have come to the bands of the assignee at any time after the expiration of sixty days and within one year from the adjudication of bankruptcy, the bankrupt may apply to the court for a discharge from his debts, due notice by mail and newspaper having been given to the creditors to show cause why a discharge should not be granted, to prevent which the proof of concealment of his property, that he has not kept proper books of account of a tradesman, has committed any fraud, has preferred any of his creditors when contemplating bankruptcy, &c. shall be sufficient. Finally, a discharge duly granted under this act, with certain exceptions, releases the bankrupt from all debts, claims, liabilities, and de-mands which were or might have been proved against his estate in bankruptcy, and affords a full and com-plete bar to all suits brought on any such debts, claims, liabilities, or demands. Creditors of said bankrupt, who may see fit to contest the validity of said discharge on the ground that it was fraudulently His debts must exceed \$300. He must present a obtained, may at any time within two years after the schedule of his debts, and to whom due, verified under date thereof apply to a court to set it aside and annul oath, either to the judge, or the Register, or one of the same. See E. James' Bankrupt Law of the U. the Commissioners of the Circuit Court of the U. States, 1867, and Gazzam's Treatise on the Bankrupt

INSPECTOR, INSPECTOR-GENERAL, terms judgments of connecta or content cannot give a payment of the same. He must also annex to his in military affairs, having a somewhat vague signi-betition an accurate inventory, verified in like manner, fication. There are inspectors-general of cavalry, infactry, artillery, engineers, militia, and volunteers, whose duties are really those which their mames infer—viz, the periodical inspection of the several corps of their respective arms, and the pointing out of deficiencies, the corps being under the command, however, of its own efficers, and not of the inspector-general. The inspectors-general of masketry and gunnery instruction are charged with the direct superintendence and ordering of such department, the inspectors general of bospitals constitute the highest grade of surgeons, under the director-general of the whole department; an officer of this rank has charge of the entire medical arrangements of an army or of a large command.

Inspectors are employed in many capacities. Inspectors of volunteers are staff officers charged with the administration, battalioning, and organising into corps d'armée of the detached corps of volunteers in their several districts. Inspectors of musketry superintend the instruction in musketry, as imparted

by the regimental instructors, &c.

INSPECTORS OF SCHOOLS. See National Education.

INSPECTORSHIP DEED is a deed executed between an insolvent person and his creditors, whereby they accept a part payment, and allow the insolvent debtor to carry on the business under their supervision, with a view to further payments.

INSPIRATION (literally, breathing into) is applied in theology to denote the action of the divine mind upon the human mind, whereby the latter is both supernaturally informed and qualified to communicate the information received. The term receitain is used more distinctively to express the first part of this action, and inspiration to express the second part. But, in truth, all inspiration, as the word litself bears, implies revelation. There is a necessity for supernatural qualification in the utterance of truth, only where the truth is send as has not been reached by the ordinary exercise of the human faculties, but in some degree at least supernaturally communicated. The prophet or apostle is inspired only as the utterer of knowledge beyond the ordinary reach of human intellification of the content of

gence.

The inspiration of the Scriptures signifies a supernatural qualification or special divine authority in the books of Scripture as depositaries of truth. When the theologian asserts any book of the Bible to be inspired, he means that it possesses an authority different from any other book, that it contains truth not merely as any ordinary book may do, but by a special divine impress. It is different from ordinary books, as conveying in a more immediate and direct, and therefore authoritative, manner divine truth. All orthodox theologians may be said to agree in ascribing this special divine character to Holy Scripture ; but further there is no agreement The mode of inspiration, the degree and extent of it, are all subjects of dispute. On one side, there are the advocates of plenary inspiration, as it is called; then there are those who advocate various subordinate or partial degrees of inspiration. The advocates of plenary inspiration contend that the whole letter of Scripture is inspired, that its words were immediately dictated by the Holy Spirit, and are literally the words of God, and not of man. The several writers of Scripture were nothing more than the penmen of the Divine Spirit, under whose control they vibrated as the strings of a harp in the hands of an artist. They were as a piece of mechanism touched by God himself. Those who maintain this theory, speak, indeed, of the individuality and diverse characteristics of the writers

of the Scriptures, but only as one would speak of the different tones which the same artist would produce from one and the same musical instrument. The differences are not so much in the moral or intellectual individuality of the writers themselves, as in the diverse aims and uses with which the Holy Spirit employs them; for, according to this theory, the Divine is all in Scripture, and the human intelligence its mere vehicle or passive instrument. The words of Scripture are no less the words of God than if He were heard to utter them from heaven. It follows from the same theory, that inspiration is essentially intermitting. It is not a higher quality of any soul, but a divine afflatus, seizing the soul at certain moments, and abandoning it at others. While the canonical epistles of St Paul and St Peter are to be held inspired, the words of these apostles at other times may not have possessed any special authority. The authority of the Scripture which they have delivered, however, is absolute. The inspired or theopneustic document is throughout faultless, as the sole work of the Divine Spirit. faultless equally in its ferm and in its essence, in its spirit and its letter. It admits of no gradation; all is equally divine, and therefore equally accurate, whether it relate to some ordinary fact, or to some great truth of the supernatural life, whether it treat of a dogma or of the details of a narrative. As one of its recent supporters writes:
'Every verse of the Bible, every word of it, every syllable of it, every letter of it, is the direct utterance of the Most High.' It follows no less that what God has thus miraculously written, He must have miraculously preserved. A providential canon is the plain sequence of a plenarily inspired

In opposition to this theory are various others, all of which impose certain limits upon the perfection of Scripture. Some confine inspiration to all that is directly religious in the Bible, to all that is directly of the character of revelation, leaving out of the question all that belongs to the sphere of science or ordinary history. Others exempt the form or letter of Scripture, and attribute inspiration only to its spirit, ideas, or doctrines. Others go still further, and comprise in the fallible form the mode of argument and expository details. Each of these theories supposes inspiration to be connected primarily with the authors rather than with the books of Scripture, sometimes with the extraordinary gifts accompany-ing the first preachers of the Word of God, some-times with the peculiar privileges of prophets or apostles, and sometimes with their special position as immediate witnesses of the facts of revelation differences may characterise the advocates of these respective views, it is plain that they, one and all, have abandoned the ground of the absolute infallibility of the letter of Scripture.

In a matter of controversy like the present, it is not our function to determine in favour of any particular view, but simply to indicate what the more important opinions are, and the grounds on which they are held. Those who claim for the letter of the Bible a freedom from all error or imperfection, do so on the d priori ground of necessity; such infallibility is held to be implied in the very idea of a revelation of the drine will; while those passages which seem inconsistent with the facts of science or of history, or with other parts of the Bible itself, admit, it is maintained, of satisfactory explanation, car readers are referred to the current Commentaries and Harmonies. Those theologisms, gam, who deny the necessity of infallibility, and hold that the inconsistencies referred to ever have and never can

be satisfactorily explained away (and their number has been for some time on the increase), argue in the following way: It is plain, first of all, and especially, that the question is not one to be settled according to any preconception, but according to the evidence of the facts given us in Scripture. The only right idea of inspiration is, as one has said, 'that which we form from our knowledge of the Bible itself. It is a question to be solved not by speculating what the Bible ought to be, but by examining what it actually is.' All à priori argureasoning what it accurate is. All a priori argu-ments are evidently at once inapplicable and dan-gerous on such a subject. The partisans of plenary inspiration maintain that it is necessary to the preservation of faith to hold, that God has not only revealed the truth to man, but that He has denosited that truth in an infallible record. Not deposted that truth in an infallible record. Not only so; but the infallibility of the canon is no less indispensable; for all would be lest if any doubt was allowed to rest apon any portion of the Word of God. But if an infallible text and an infallible interpretation? Without the latter, the two forems may be of an any and all the contwo former may be of no use. All may be lost by a false or defective commentary of the sacred text. It is plain that the idea of verbal inspiration cannot stop short of the conclusion of an infallible interpretation; and even such a conclusion, which upsets Protestantism, by denying the right of free inquiry, would not save it; for an infallible commentary would not necessarily insure infallible instruction -all might still be lost by the weakness, ignorance, or defect of the recipient mind. No infallibility of text, of canon, or even of interpretation, could insure the infallible reception of the truth, thus trebly guarded. If we would not be caught, then, in this absurd chain of assumption, we must break its first link, and ask, not what the Bible must be or should be, but what it is. This view is strongly argued in a recent treatise on inspiration by M. de Pressensé, one of the most distinguished of the French Protestant divines belonging to the evangelical school of theology. According to this writer, who may be taken as the representative of a large class of theological thinkers, the Bible is a mass of documents of varying age and varying authenticity; its text has undergone the usual changes attending the trausmission of historical documents; it is marked by the usual inequalities and varieties of style that we meet with in any other collection of ancient literature; it presents in many cases peculiar difficulties, differences and even contradictions of detail, scientific and historical errors. All who have studied the Gospels minutely, and especially the quotations in the Gospels and the Epistles of St Paul from the Old Testament, know that there are various inaccuracies and misapplications of facts throughout them. The same microscope of criticism that reveals to us the depths of the inner meaning of the divine message in all its manifold fulness, reveals to us also the imperfections, and even the contradictions, of the human messenger. The following are only a few of the instauces in which such 'imperfections and contradictions' shew themselves.

1. The recital of the temptation in St Matthew and St Luke. In the former (Matt. iv. 6-8), the vision from the pinnacle of the temple is placed first; in the latter (Luke, iv. 1-10), that from a

list; in the later (link; iv. 1—10), the from a loty mountain takes precisione.

2. In Matt. x. 10, Jesus commands his apostles to take for their missionary journey neither 'scrip, neither two coats, neither shoes, nor yet stares.' In Mark, vi. 8, he commands them to 'take nothing for their journey, save a staff only.

the Resurrection, there are numerous contradictions of detail resting on a fundamental and striking unity. According to Mark, xiv. 72, the cock is represented as crowing on each of the first and second occasions on which Peter denies his Lord. In second occasions on which Peter denies his Lord. In the accounts given by the other evangelists, the cock only crows upon the third denial (Matt. xxvi. 74; Luke, xxii. 60). The statement of the death of Judas differs materially in Matthew and in the Acts of the Aposites. According to the former, and hangs himself; pieces of silver, and departs words purchase with the price of his guilt the potter's field for the burial of strangers, hence called the field of blood. According to the Acts of the the field of blood. According to the Acts of the Apostles, i. 18, Judas himself is represented as having purchased the field 'with the reward of iniquity;' then as having in some way (not explicitly stated in the narrative) met there a bloody death, from which circumstance the field took its name. In the narratives of the Resurrection, it is well known there are numerous variations; and numerous palpable errors of memory as to historical facts occur, such as may be seen by comparing Mark. ii. 26 with 1 Sam. xxi. 2-6, and 1 Cor. x. 8 with Numb. xxv. 9.

4. As to the citations of the Old Testament in the New, they are almost entirely taken from the Septuagint, and evidently in many cases quoted from memory, with little regard to their exact sense in the original. Thus, St Matthew (ii. 6), in applying to the Messiah the prophecy of Micah (v. 2), says of Bethlehem precisely the reverse of the Septuagint. 'Thou art too little to be reckoned among the thousands of Juda,' he translates : 'Thou art not the least among the princes of Juda.' In many cases, the New Testament writers, while repeating the inaccuracies of the Septuagint translatiou, turn them to admirable account; this is especially remarkable in the gospel of St Matthew and the Epistles of St Paul. Thus (iii. 3), St Matthew translates with the Septuagint: 'The voice of one crying in the wilderness;' while the Hebrew or one crying in the winderness; while the Hebrew is: 'A voice cries, Make plain in the wilderness the ways of the Lord' (Isaiah, xl. 3). Compare also Matt. xii. 21 and Isaiah, xlii. 4, also Matt. xv. 8 and Isaiah, xxix. 13.

None of these errors, it is maintained, are of any material consequence so far as the substantial veracity of Scripture is concerned. The very fact that a microscopic criticism can detect no more serious inconsistencies in the Scriptural writers, is rightly held to be one of the most striking testi-momes that could be given to their truthfulness. Such slight inaccuracies are the mere freedoms which writers, thoroughly honest, and animated with a high interest which overlooks trifles, permit themselves. But however unimportant in them-selves, they are considered by many theologians to be altogether inconsistent with a theory of verbal inspiration. However minute, they are recognised as real discrepancies—human imperfections in the sacred record—and as consequently proving that the mere text or letter of Scripture is not infallible, that it cannot be regarded as a 'direct utterance of the Most High.

Inspiration, therefore, according to these theologians, does not imply the infallibility of the Scriptural text; it is something consistent with scientific, historical, exegetical, and even argumentative errors (witness, to quote no other example, St. Paul's allegorical argument about the sons of Abraham, Gal. iv. 22, 25). There is nothing valid, no divine authoritative element, it may be said, that can survive such deductions. If there are 3. In the narrative of the Passion, as in that of such errors in Scriptures, why may it not all be imperfect or erroneous? The sufficient answer is, that it is not so-that, judged by the very same critical tests which detect such errors, the Bible remains an entirely unique book. Every Christian mind recognises in it a higher divine knowledge and authority than in aught else. The divine spirit in Scripture makes itself felt, shines forth in every page of it; and this is inspiration in the highest sense, the mind of God meeting our minds in Scripture, enlightening, guiding, elevating, purifying them. There is nothing more in reality to be got from any theory than this. An inspired letter, or word, or message is nothing to any one in uself; the meaning is everything. We must understand the word or message. There is no degree of objective authority that cap supersede this subjective process of apprehension on our part. There cannot, therefore, be immunity from error, let the symbol or the text be as perfect as possible. It is only to us what we see it to mean; and this meaning, in the case of Scripture, shines with a divine power and lustre such as invest no other book. It bears its own divine witness. In such an idea of inspiration, criticism finds nothing inconsistent, nothing impossible, and no higher idea can be well formed

INSTALLATION, in Church Law, means the ecremonial act or process by which a person presented and legally confirmed in a benefice is formally put into possession of his office, and by which he is fully empowered not alone to excreise its functions, but to enjoy its honours and emoluments. The ceremonial form, as well as the name, differs according to the office which is conferred, as 'enthronisation' for a bishop, 'induction' for a rector, &c. 'Installation' properly regards the office of a canon or prebendary. The word is also used generally for a formal introduction to any office.

I'NSTERBURG, a town of Prussia, in the province of East Prussia, is pleasantly situated on the left bank of the Angerap, 15 miles west-porth-west of Gumbinnen. It contains a castle, and several educational institutions. Cloth-weaving. tanning, brewing, and distilling, with a trade in corn and linseed, are here carried on. Pop. 11,814. I. had its origin in a castle of the Order of Knights, built here at an early period. At the close of the 16th c., it had attained the rank of a town, which increased considerably after the 17th c., about which time a number of Scottish families settled at I. on account of its trade

I'NSTINCT. It has been common to describe the actions of the lower animals as guided by principles different from what obtains in the human constitution. The power of self-preservation is considered as reason in man, and as instinct in the brutes; but this contrast does not contain a real opposition. There is much that is common in the impulses of men and animals. When an animal, having found a morsel agreeable to its taste, masticates and swallows it, and takes up another of the same, the mental operation is not essentially different from what a human being would go through in the like circumstances. In both instances, we have an example of the exercise of Will, or volution, which operates to promote the pleasures and ward off the pains of the sentient being.

The most important meaning connected with the term Instinct is what contrasts with experience, education, and acquired knowledge. The original or innate tendencies and powers of the mind are to be distinguished from the powers that grow up in the course of the animal's experience of the world,

There has been a disposition to under-rate the acquired aptitudes of the inferior animals, and to refer their eapability of self-preservation purely to their natural or primitive endowments. point of fact, men and animals alike possess both instincts and acquisitions; for although in man the preponderance is greatly in favour of the acquired, he, too, must start from something primordial, the basis of the other. To ascertain what is really primitive in the human mind, is an interesting problem both on its own account, and also as throwing light on the still more difficult subject of animal instinct.

In the first place, there are certain actions of importance to the safety and well-being of the individual that are termed Reflex, or Automatic. They seem to be almost out of the sphere of mind proper, as they are performed even unconsciously, Among these are the propulsion of the food along the alimentary canal, sneezing, respiration, &c. In all these, we have important activities, which are inherent in the constitution, and are performed as effectually at the beginning of life as at the full

maturity of the being.

In the second place, there is a certain original provision for Rhythmical and Combined Movements among the active organs, more especially those concerned in Locomotion. Thus, there is a natural tendency to alternate the limbs, although the human infant eannot turn this to account at once for the ends of walking, as some of the quadrupeds can. From this alternation, the two eyes and the two sides of the face are specially exempted, and brought under another arrangement equally primitive-namely, concurrence; for it may be noticed that the eyes always move together, and cannot by any effort be prevented from so doing. The conjunction of the two sides of the face is less rigorous; we may acquire the power of opening one eye, and of contorting the leatures, by making one side act without the other. But all these cases alike illustrate the presence of an original mechanism of the frame, by which the movements are grouped up to a certain point.

In the third place, it may be safely maintained that there is an inhorn tendency in all animals to act somehow, or to put forth the energies that they possess, without waiting for the stimulus of their sensations. This Spontaneous Activity is shewn more or less in every creature after rest and nutrition. The dog and the horse take the field without any special aim, in the first instance; they are simply urged on by an inward battery of undischarged power. They soon learn to bring this power into the service of their wants, or to direct it for their preservation and pleasure; but it shews itself at once, and before its effects are known or calculated. Some animals have this tendency in a very high degree. Destitute of any special direction at the outset, it yet prompts to a great many experiments or trials upon things, in the course of which the animal discriminates the suitable from the unsuitable by means of its sensations, and thereby learns to follow up the one and eschew the other. This is a most vital consideration in tracing the acquirements of animals, for it enables us to surmise that some of their aptitudes that manifest themselves so early as to appear instinctive, may be, after all, nothing more than very rapid acquisitions, the result of that experimentation prompted by the inhorn or spontaneous activity.

Fourthly, in connection with our Emotions, there are certain primitive links of mental state with boolily manifestation, which constitute a natural language of the feelings understood by the whole and its companionship with other living creatures. human race. The meaning of the smile, the frown,

the sob, the contortion of pain, is uniform, and therefore instinctive. See EMOTION.

Fifthly, the power of will or volition, although it can be shown to be a growth, must have some primitive and instinctive elements in the constitution

to start from. See WILL.

Sixthly, there must be certain primordial powers of the human Intellect. What these are has been much disputed. Every one must concede the existcuce of some intellectual forces or faculties, as, for example, Discrimination, the basis of all knowledge; Retentiveness, the faculty of retaining everything that is acquired; and agreement, or Similarity (see INTELLECT); but it is contended by one school that we possess not merely powers of receiving know-ledge by our contact with the world, and our consciousness of our minds, but actual notions or ideas that cannot be traced to our experience of the material or mental phenomena that we encounter. This is the doctrine of innate ideas, intuitive conceptions, à priori cognitions and judgments, first truths, &c., and it has been applied both as regards knowledge and as regards practice or duty. Locke's Essay on the Human Understanding contained the first elaborate examination of this doctrine, against which he produces an array of most formidable objections (Book I.). Kaut and his school have maintained the *a priori* view with reference to a certain class of first principles, such as the axioms of mathematics and the law of causation. Sir John Herschel and Mr John Stuart Mill are among the most distinguished living advocates of the opposite opinion, which would refer such principles as the mathematical axioms ('things that are equal to the same thing are equal to one another,' &c.) to experience, like any other species of knowledge, See COMMON SENSE.

Seventhly, closely allied to this last controversy, if not a part of it, is the instinctive foundation of belief. The faculty of believing must be pronounced a genuine instinct, for although experience supplies us with natural conjunctions, as that 'water drowns,' 'fire burns,' 'the stars are distant,' that peculiar energy called belief, and which implies a readiness to act upon our knowledge, must come from some other part of our nature, which can be no other than the sources of action. See

BELLER.

So much as regards the human instincts. The mental system of the lower animals is much less perfectly understood, and no sufficient observations exist to enable us to draw clearly the line between the intuitive and the acquired powers in any single species. The popular tendency has been to under-rate the acquired knowledge of animals, if not to ignore it altogether. It is then made a matter of vulgar marvel that they should do by inborn power what human beings require an education to perform. We even attribute to them something like a superhuman inspiration, as when we speak of the bee as a geometer, of the swallow as a meteorologist, and of the beaver as an architect, implying that these creatures have found a royal road to the sciences. The facts confidently asserted and universally believed respecting animals so familiar as the chick and the duckling are really, if examined, such as to stagger credibility, for they involve in these

incredible, until it shall be established by at least some hundreds of unequivocal experiments made for testing this very point. It is likewise said that the chick recognises grains of corn at first sight, and cau so direct its movements as to pick them up at once; being thus able to know the meaning of what it sees, to measure the distances of objects intuitively, and to graduate its movements to that knowledge-all which is, in the present state of our acquaintance with the laws of mind, wholly incredible. It may be possible, not only for this incredibility to be removed, but also for the allegations themselves to be established as true; but the evidence requisite for that purpose has never yet been obtained.

The same uncertainty attaches to those far-sighted provisions that are made by certain animals for their own future wants and for their progeny yet unborn. The precise immediate motive that induces the bird to build its nest, and the circumstances that determine it in the choice of locality, material. and pattern, have never been made the subject of accurate experimental inquiry. It is not known how far imitation can work in the lower animals. nor to what extent they can derive instruction from the elders of their tribe. That they are observant of one another's movements is shown in many ways: their keeping company and acting in concert imply as much. The analogies of the human feelings, will, and intellect, might go far to explain their conduct, without supposing a mysterious occult revelation made to them specially, and not partaken of by the higher forms of the animal organisation. At present, we are not in a condition to dogmatise, owing to the want of proper observations in the whole department of brute intelligence. Various striking examples of the mistaken interpretation of the conduct of animals might be quoted in contirmation of the remark now made. See Crouch's Illustrations of Instinct.

I'NSTITUTE, a term used in Scotch Entail Law to denote the person who is first mentioned or described as entitled to take the entailed estate, All those who come after him are called substitutes, When the institute dies before the entailer, the next person mentioned takes as institute. There are certain rules of construction which favour the institute, but these are entirely technical.

INSTITUTE, THE, in English Law, is the mode of citation or reference to Chief-justice Coke's great work, in four volumes, on English law. Another name for the first part of it is Coke upon Littleton. owing to its being a commentary by Coke upon a work of Littleton. The second book is a comment on acts of parhament, the third is a treatise on the pleas of the crown, and the feurth on the different kinds of courts.

INSTITUTE OF FRANCE. On the revival of letters, associations for mutual intercourse and co-operation, called Academies (q. v.), were formed in Italy and France, one of which, composed of poets of no great note, was converted by Richelieu into a national institution, under the name of Académie Française, and met for the first time 10th July 1637. The chief object of this institution was the cultivation of the French language; but this to sugger eventuality, for they invoive in these the cultivation of the French language; but this creatures the knowledge at birth of the facts of the was indifferently accomplished, owing to the interesternal world, as when it is affirmed that the duckling knows on first secting water that this is the right of directing the public state. Many of its proper element, where it can swim and float, the judgments of this Academy were strangely instead of walking awkwardly on its two feet. Now, cross-consequence, as its rejection of the Chil of Cornelle, of the control of the

much disputed, and the plan of it generally con- The members and correspondents are classed as follows: demned.-The taste for devices, inscriptions, and medals, which prevailed in the 17th c., suggested to Louis XIV. the foundation of the Académie des Inscriptions in 1663, for the immediate object of examining his collection of medals and other antiquities; but the Abbé Bignon, superintendent of the Royal Library, seenred its perpetuation, with an extension of its field of labour, as the Académie Royale des Inscriptions et Belles-lettres, under which designation it met for the first time 16th July 1701. -The third Academy in order, and at present the most distinguished scientific association in the world, the Académie Royale des Sciences, was founded by Colbert in 1666, remodelled by Bignon in 1699, and further enlarged in 1785.—The painter Le Brun founded in 1648 an Académie de Peinture, for which he obtained a charter in 1655; and tor which he obtained a charter in 1655; and in 1664, Colbert remodelled and established it as the Académie Royale de Peinture et Sculpture.

—An Académie Royale d'Architecture was also

fonnelod

All these Academies were suppressed by an edict of the Convention, 8th August 1793; but on 25th October 1795, the Directory established a great national association, for the promotion of the arts and sciences, called the Institut National. It was at first divided into three classes-viz, Sciences Physiques et Mathématiques; Sciences Morales et Politiques ; Sciences de Littérature et Beaux-Arts : but on the suppression of the second class by the First Consul in 1803, the remaining classes were re-arranged as follow: Sciences Physiques et Mathématiques; Langue et Littérature Française; Histoire et Littérature Ancienne; Beaux-Arts; and this arrangement continued during the First Em-pire. On 21st March, 1816, a royal ordinance commanded that the four classes should be re-placed by four Academies, but the general title. 'Institute of France,' was retained, being modified by the epithet 'Royal,' 'Imperial,' or 'National,' in barmony with the political changes in France.
The four Academies are 1. L'Académie Françaixe; 2. L'Acudemie des Inscriptions et Belles-let-3. L'Académie des Sciences; 4. L'Académie des Beaux-Arts; and an ordinance, bearing date 26th October, 1832, re-established the old second class as a fifth Academy, L'Académie des Sciences. Morales et Politiques, and this organisation still

Each Academy has its own independent government, and the free disposition of the funds allotted to it, an agency and secretaries; the library and the valuable collections of the Institute are common to the five; the common fund is managed by a committee of ten members (two from each Academy), under the presidency of the Minister of Public Instruction. Members are elected by ballot, the election requiring to be confirmed by government, and members of nne Academy may be elected as members of any or all of the other four. Each member has an annual salary of 1500 francs, and the secretaries have 6000. Each member also receives a Napoleon for each meeting of the Academy at which he is present, but is liable to a fine if absent for a whole year, or to expulsion for a prolonged absence without sufficient cause shewn. Each Academy meets once a week for two hours; each has also one public annual sitting; and on 15th August, there is a general public meeting of the whole tive. All the Academies, with the exception of the first, have a certain number of académiciens libres, associés étrangers, and correspondants; the 'académiciens libres' have only the right of attend-ing the meetings of the Academy; the 'associés étrangers' are foreign members.

	Mem- bers,	Acad.	Ansoc. E(rang.	Corre

	226	36	32	236

Among the 'associés étrangers' now living, there were in 1868, in the 3d Academy, Sir J. F. W. Herschel and R. Owen; in the 4th, Donaldson of London; in the 5th, G. Grote and W. E. Gladstone. Among the correspondents we find in the 2d Academy, T. Wright, Sir. 11. Rawlinson, B. H. Hodgson, A. H. Layard, Max Mül-H. Rawillisoh, D. H. Hougson, A. H. Layard, Max Mul-ler, S. Birch, and E. W. Lane; in the 3d, Prof. Syl-vester, Rev. H. Mosely, W. Fairbairn, G. B. Airry, J. R. Hind, J. C. Adams, Prof. Cayley, Capt. Richards, Profs. Wheatstone and E. Frankland, Sir R. I. Murchison, Sir C. Lyell, J. D. Hooker, Prof. Agassiz, and W. Lawrence; in the 4th, J. Pye, J. Benedict, and C. T. Newton; and in the 5th, Dr. Tappan, of Detroit, Dr. Newton; and in the str, pr. Tappan, of Detroit, pr. Lieber, of N. York, E. Chadwick, H. Reeve, C. Bab-bage, J. S. Mill, A. W. Fonblanque, G. Bancroft, of N. York, J. L. Motley, of Roston, Mr. Stanhope, and A. P. Stanley.

The Académie Française occupies itself with debates on grammar, rhetoric, poetry, and French literature in general, and its great work is the preparation and continual improvement of a dictionary of the French language. It has the disposal of two French language. It has the disposal of two prizes of 10,000 frances each, one of 2000 frances, and every alternate year, a sum of 1500 frances to be bestowed on meritorious authors in poor circumstances. The Académie des Inscriptions et Belles-lettres has for its subject history in its most comprehensive sense, including chronology, geography, numismatology, and the study of monu-ments of every kind, and of the languages of all nations at all times. It has in its gift a prize of 2000 francs, and another for numismatology. The Académie des Sciences has for its subject statistics, pure and mixed mathematics, medical science, &c.; and has the gift of eleven prizes, several of which are of 10,000 francs; all are annual, with the exception of one, which is decennial. The Académie des Beaux-Arts occupies itself with painting, sculpture, architecture, engraving, and music; and with the preparation of a dictionary of the fine-arts, and, alternately with the first Academy, distributes the sum of 1500 francs among poor meritorious authors. The Académie des Sciences Morales et Politiques discusses mental philosophy, law and jurisprudence, political economy and statistics, general and philesophical history, and politics, administration, and finance; and has the gift of two prizes-one decennial, the other quinquennial. There is also a Bordin prize in the gift of each Academy; and two general prizes-one annual, the other triennial-in the gift of the Institute.

Each year a sum is voted by the French govern. ment for the general fund of the Institute, and from this fund are paid the allowances of members, salaries of the secretaries and other officials, and several prizes; also experiments, printing, &c.

INSTITUTES is the name given to the elementary treatise on the Roman or civil law. See Law,

INSTITUTION, in Church Law, means the final and authoritative appointment to a church benefice-more especially a bishopric-by the person with whom such right of appointment ultimately rests. Thus, in the Roman Catholic Church-even after the 'election' of a bishop by the chapter, or his 'nomination' by the crown, when that right belongs to the crown—it is only the pope who confers 'institution.' In English usage, Institution is a conveyance of the cure of souls by the bishop, who, or whose deputy, reads the words of the institution, while the clerk kneels. The institution vests the benefice in the clerk, for the purpose of the profits thereof. But the title is not complete till Induction (o, v.).

INSTRUMENT, in point of law, is scarcely a technical term, though it is frequently used in England as descriptive of a will or testamentary writing—and often any document not under seal. In Scotland, on the other hand, it is usually descriptive

only of a notarial instrument.

INSTRUMENTA'TION is the arranging of music for a combined number of instruments. nature and character of the musical ideas must alone determine whether the instrumentation shall be simple or artistic, and perhaps complex; the latter being the case when some of the instruments take a more prominent part than others. For hoth purposes, a thorough knowledge of every instrument in the orchestra is absolutely necessary, as without this, instrumentation becomes only a deafening mass of sounds. The stringed instruments, from their nature, in most cases, form the principal parts of a score, around which the other instruments move, without depriving them of their importance. The wind instruments represent, more or less, as it were, a subordinate chorus, which may again be divided into two kinds, viz., the wood instruments and the brass, which, with the stringed instruments, give three essentially different choral effects, that may be mixed up together in endless variety. A know-ledge of the art of instrumentation is only to be acquired by great experience; at the same time, acquired by great experience; at the same time much may be learned by consulting the following works: Die Instrumentirung für das Orchestra, von A. Sundelin, published in Berlin by Wagen-führ; and Dr Joseph Fröhlich's Systematischer Unterricht in den vorzüglichsten Orchesterinstrumenten.

INSTRUMENTS, Musical, may be divided into three classes—stringed, wind, and percussion. Stringed instruments are of three kinds: those whose sounds are produced by friction, as the violin, viola, violoncello, &c. ; by twitching with the finger or otherwise, as the harp, guitar, mandoline, &c.; by striking, as the pianoforte and dulcimer. Wind instruments are of two kinds, viz., the reed species —as the hauthoy, clarionet, &c.—and the flute species, as the flute, flageolet, &c. The trumpet, horn, trombone, and all similar wind instruments, are generally classed among the reed instruments; but whether the sound is produced by the lips of the blower acting as a reed, or by the compressed stream of air, as in flute instruments, is not yet determined. Percussion instruments are those which on being struck produce only one fixed sound, as the drum, triangle, cymbals, tambourine, &c. Whatever material may be used to form a musical instrument, there are only two means of producing musical sounds, and these are by the vibrations of a fixed elastic body, such as the string of the violin or pianoforte, the reed of the hautboy, bassoon, &c.; or by the vibrations of a confined column of air put into motion by a stream of compressed air, as in the flute, flageolet, and all the ordinary flute species of organ-pipes.

INSUCKEN MULTURES, in Scotch Law, mean may be estimated at 4s. per cent. A duty of 3s, the payments made to the miller by persons who per cent. per annum is levied by government upon are bound to grind their corn at a particular mill, all fire insurances, except farming-stock and public under a servitude called Thirlage (q. v.). Out hospitals, and the parliamentary returns made of it

sucken multures mean the payment for the mere grinding, which strangers pay; and the insucken multures include that plus a small premium, which goes to the proprietor of the mill.

INSU'RANCE, a contract of indemnity, whereby one party, in consideration of a specified payment, called a 'premium,' undertakes to guarantee another against risk of loss. The first principles of insur-auce would appear to have been acted on at a very early period, since, without attaching undue importance to the opinions of writers who contend, on the authority of Livy, that they were known during the second Punic war, or that the Emperor Claudius can be considered an insurer, because, in order to encourage the importation of corn, he took all the loss or damage it might sustain upon himself—there are yet extant rules of sundry 'guilds,' or social corporations of the Anglo-Saxons, whereby, in return for certain fixed contributions, the members guarantee each other against loss from 'fire, water, robbery, or other calamity.' It was, however, to cover maritime casualties that insurance, viewed in its commercial aspect, seems to have been first nudertaken. So early as 1435, the magistrates of Barce-lona issued an ordinance relating to this class of business, and we find in the speech of the Lord Keeper Bacon, on opening Queen Elizabeth's first parliament, the allusion, 'doth not the wise merchant, in every adventure of danger, give part to have the rest assured.' The merit of being the first to apply mathematical calculations to the valuation of human life belongs to the famous John de Witt, pensionary counsellor of Holland, whose Report to the States-general, on the valuation of life annuities, has been lately brought to light by Mr Hendriks. The first insurance company established in Britain appears to have been the 'Amicable,' founded in 1696; not the office known by that name now, but the one that still exists as the 'Hand in Hand.' Omitting the gambling and other objectionable projects for which the science of insurance has been held responsible, it would exceed insurance has been held responsible, it would exceed the limits of the present article to give any detailed account of even the more legitimate applications of it which are current at the present day: the traveller can be protected from the pecuniary loss entailed from damage by rail or flood; the gardener from the devastation of the hallstorm; the farmer from the inroads of disease among his cattle; and employer and employed alike reap the benefit of a guarantee on fidelity. Two bundred established offices within the United Kingdom appeared in an accredited list published in 1862, and although there were, besides, 56 winding up in Chancery, there is an amount of confidence to be placed in the stability and integrity of the greater number existing, that cannot be exceeded in any other commercial interest. We propose confining our remaining remarks to the divisions of fire, life,

and marine insurance.

1. Fire Insurance.—Although the business of fire insurance is not founded upon such exact data as can be made available in the practice of life insurance, yet considerable progress has been made by the offices towards a correct classification of the risks they run, and the rates of premium range by slight gradations from a minimum of 1s, 6d, per cent, which covers an ordinary private dwelling-bouse, to £6, 3s, per cent, and upwards, charged for cent, which covers an ordinary private dwelling-bouse, to £6, 3s, per cent, and upwards, charged for remium received for risks in the United Kingdom may be estimated at 4s, per cent, per annum is levide by government upon all fire insurances, except farming-stock and public hospitals, and the parliamentary returns made of it

afford valuable statistical information of the total amount insured. The duty paid in the year 1860, per return last published, amounted to £1,558,608. representing a gross amount insured over the year of £1,039.072.140, and there was likewise covered by the different companies, farming-stock to the extent of £7:3,309,898. The effect of such a heavy impost as the duty, is felt to be a serious impediment to the progress of fire insurance, although the case and trifling expense at which it is collected offer great inducements to successive chancellors of the exchequer to perpetuate the tax. Conceding that the revenue must be obtained, a tax on prudence certainly seems an objectionable method of raising it, and it is likewise found to be an inequitable one. A very large proportion of the whole property insured is covered at the minimum rate of 1s. 6d. per cent., and from this the office having to pay its agency and other expenses of management, it is hardly too much to say that in such cases the tax is threefold the net premium required to cover the risk. Fire insurance policies are of too familiar use to require explanation here, but one point in connection with them may be noticed: unlike a marine policy, they guarantee the insured to the extent of the whole amount specified in them, without regard to the excess of value of the entire property before the fire, nuless an exceptional 'average clause' is attached to the policy.

2. Life Assurance, in its widest sense, is a contract entered into by the assurer to pay a certain benefit contingent upon the duration of one or more lives. The 'present value' or single premium corresponding to an assurance of £1, payable at the end of the year of death of an individual, is deduced from the way of the contract of the same like less Assurance and is expressed the same like less Assurance and is expressed to the way which will amount to £1 in one

year (therefore equal to $\frac{1}{1+r}$, r being the interest of £1 for a year), and A_r is the value of an annuity of

£1 per annum on the life aged z. The more common form in which a life assurance is carried out is, however, by the payment of an annual premium to the company assuring, and this is determined (using the same symbols as above).

by the formula $\frac{1}{1+A_x} - (1-v)$. The demonstration of which, in a popular form, is thus ingeniously done by Mr Gray. The present value of an 'immediate' annuiv on a life aged z—i.e., of an annuity of which the first payment falls to be made at the commencement of the transaction—being $1+A_x$, it is easily deduced by proportion that £I will pur-

chase an immediate annuity of $\frac{1}{1+\Delta_s}$, the reciprecal of the first value; and this would be the proper premium for the benefit if the latter were paid to the assured at the edge of the data varied at the end of the last year of the duration of the policy; but inasmuch as the benefit is not paid until the close of the stipulated period, the difference between its immediate value and its value if due a year hence (1-e) has to be deducted from

each year's premium, and the formula is the result. The three important elements that have to be taken into account in the calculation of office-premiums are—the rate of interest which is to accrue from their investment, the mortality returns with which the future experience of the insured is expected to agree, and the proportion or 'loading' management, and affird a profit to the properties, and the properties of the first properties of the properties of th

as the nearest to what can be expected to be realized on good security for transactions extending aver many years. The mortality table most generally in use is that originally published by Mr Milne, derived from the observations of Dr Heysham on the rate of mortality in Carlisle during the nine years 1779 to 1787, inclusive, and hence known as the Carlisle Table. It is admitted to be a correct representative of healthy life in England, and from the great number of published computations founded on it, is likely to retain its place in the estimation of actuaries.

The following are examples of net premiume calculated on these data:

SINGLE AND ANNUAL PREMIUMS FOR ASSURANCE OF £100, FOR WHOLE OF LIFE—CARLI-LE, 3 FER CENT.

Age.	Single Premium,	Annual Premium.			
20 25 30 35 40 45 50 55 60	£ a. 4. 33 17 111 34 17 102 40 2 6 43 7 111 47 3 2 50 17 82 55 8 72 60 18 11 66 10 71	£ a d. 1 9 10 1 1 14 0 3 1 19 0 4 2 4 8 2 11 11 4 3 0 4 3 12 5 2 4 10 10 2 5 15 9 5			

The question of the addition to be made to such (net) premiums is influenced by different considerations having regard to the practice of the office

using the table.

Assurance companies are divided into three classes: 1. Proprietary Companies, being these offices pos-sessing a capital the property of the partners, and which, in addition to the accumulated premiums, is pledged to the policy-holders as a guarantee for the fulfilment of their claims. As the liability in such companies is limited to the net sums assured, the addition made to the premiums requires to be only such a proportion as will cover the actual outlay for management, and remunerate the share-holders for the risk of loss by fluctuation in the mertality, or from bad investments, which they run. A comparison of the above premiums with the 'non-participation' rates usually advertised, will the 'bon-participation races usuary auvernacus was shew that the prevailing competition has induced the construction of tables very favourable to the public. 2. Mutual Offices, where the members themselves constitute the company, being liable to each other for all claims. Here, in the absence of a capital, it is usual to adopt a scale of premiums known to be in excess of what is required to meet the sums insured. The profit arising therefrom is periodically ascertained, and allotted to the assured, most frequently in the form of 'bonuses' or additions to the claims payable under the policies. Some

companies doing a large business are of this class, and in point of stability and irreprachable management bear the highest character. 3. Nicod Conspanies are proprietary companies charging such increased rates as will yield a bonus, but which, in return for the expenses of management and gunantee of their capital, reserve for their proprietors

a stipulated proportion of the profits.

It would be becomed our province to deal with the comparative merits of these systems; undoubtelly, offices in which the assured participate in a pact or the whole of the profits, have for some years lack enjoyed the largest share of public support. Life-assurance, in the abstract, in certainly one of the assurance in the abstract, in certainly one of the assurance in the abstract of public support. Life-assurance in the abstract is extend to which it has been made available may be judged from the fact, that the total sum, including vested bonuses, for which the existing offices are liable to estimated at about £200,000,000 setting; the

annual premiums payable, therefore, being between five and six millions—a sum equal to \(\frac{1}{12}\)th of the net public revenue of the United Kingdom.

A greatly increased facility for making the necessary calculations in connection with life-assurance has been developed within the last few years by the use of 'Commutation Tables,' the invention of Mr use of Commutation lables, the invention of Mr George Barrett, and of which a large collection, calculated by Mr D. Jones, is published by the Society for the Diffusion of Useful Knowledge. For the best information on their construction, and other formulæ, the reader is referred to the standard works of De Morgan, Gray, Milne, and the traus-actions of the Institute of Actuaries, published

quarterly. 3. Marine Insurance. - Although this branch of the subject does not possess such a general interest as the preceding, it is one that requires quite as great an amount of study and experience to insure its successful prosecution. In estimating the rate of premium, the insurer has to take into account not only the quality of the vessel covered, but the season in which she sails, the known character of her captain, the nature of the commodity carried. and (the contract being an indemnification both against the elements and the enemy) the state of our political relations. Nevertheless, losses at sea, like other incidents, are observed to follow certain laws, and if the average from which the value of the risk is deduced is of sufficiently broad basis, the result over equal intervals of time can be predicted with reasonable certainty. Until 1824, the only companies that could grant marine insurances were the Royal Exchange and London Assurance; and although the monopoly of these offices then ceased, and various other companies were established, such is the force of usage, that hy far the greater portion of the business continues to be transacted tion of the business continues to etailsacted by individual insurers designated 'underwriters.' The underwriters of London form an influential society known as 'Lloyd's' (q. v.), from having originally met in a coffee-house kept by a person of that name in Abchurch Lane; and their extensive business, numerous agents for procuring information, and general influence in the mercantile community, have long gained for them a world-wide reputation. As a small number of risks, viewed in connection with the great hazard to which property at sea is exposed, would not secure a safe average to the individual insurer, be finds it prudent to take but a fractional part of the entire risk on himself, and this is done by subscribing or 'underwriting' the stipulated proportion on a policy drawn out for the whole amount to be covered. The necessity for whole amount to be covered. The necessity for circulating the policy for this purpose, and other-wise negotiating the insurance, has given rise to another business, that of the 'insurance broker,' with which, however, that of the underwriter is often combined. A system of mutual insurance is frequently carried out by associations of ship-owners forming 'clubs,' differing in some degree from the protection afforded by the ordinary underwriter, inasmuch as a club grants an indemnification for the loss for which the insured may at law be held responsible for damage done by his ship to As such a 'collision' guarantee is now another. frequently made a stipulation in an ordinary policy, this distinction is, however, gradually disappearing.

Marine insurance differs from an ordinary fire insurance, in respect that in case of partial loss the underwriter pays only such a proportion of the sum insured as the damage sustained bears to its whole value at the time of insurance. See AVERAGE. In adjusting a partial loss, it is usual to deduct one-

Policies are of two kinds, 'valued'-where the ingerance is based on a specific bill of lading-and 'open, where, in case of loss, the value of a ship with her stores is estimated as at the date of sailing, her freight at the amount she would have carned had the voyage terminated favourably, and her cargo at its invoice price, adding premium and all charges. The insurance is binding although the ship may have been lost when the policy was executed, but any warranty, if not true, is held to vitiate the insurance, even although the misstatement is not material to the risk. A stamp-duty is levied upon all marine insurance policies, although well-grounded objec-tions are urged against it. A tax on prudence, it is unfairly made to increase with the risk. In the coasting traffic, it presses unequally on the carriage by sea in competition with the land traffic on which no such burden is imposed, and in other business it offers an inducement to employ the foreign in preference to the British underwriter. In fixing the amount of stamp-duty, the choice lies with the insured of doing so with reference to the term of insurance (not exceeding one year), or to the rate of premium per single voyage, by the following table:

For any term Exceeding Six		ceedi		_	onths,		d. 6 per £100.				
BY RATE OF PREMIUM,											
							d.				
Not exceeding		er cer	nt.				3 per £100.				
	2115.	27				0	6 w				
,	305.	27				1	0 "				
	40r.					2	0				
	ro-					_					

The revenue of the government from this source was for the year ending March 1861, £328,735, but although this was a slight advance on the amount of previous years, it has been shewn, from returns obtained by Mr Leone Levi, that the proportion of obtained by Mr Leone Levi, that the proportion of vessels insured to the number of wrecks has over the same period been gradually diminishing, a diminution in the ratio of insurances which Mr Levi attributes to the pressure of the duty.

INSURANCE, IN LAW .- The law on the subject of insurance is substantially the same throughout Great

Britain and the United States.

Exceeding 50s.

Fire Insurance. - The contract is generally preceded by proposals, in which case the proposals and policy of insurance must be read together, if the policy refers to these proposals. In order to insure property, the insurer must have some interest in the property insured, for otherwise there would be an inducement to commit arson. But he need not be owner; it is enough that he be accountable for the goods, or hold a lien on them, as a carrier, wharfinger, or hailee. Thus, many carriers keep up a floating policy to cover all goods which may happen to be on their premises within a given In all these cases, the words of the policy period. are the important points; and good faith is required in giving a correct description of the goods or premises, for every statement or representation as to anything that is essential is taken to be a warranty. The premises must not be materially altered during the risk, otherwise the policy will be void; but often the policy stipulates that alterations may but often the policy supurness that afterations may be made on giving notice. A person in lodgings may insure his goods, and may safely call the house his 'dwelling-house' for that purpose. But, as a general rule, great care must be taken by the insured not to misrepresent anything material, and not to conceal any extraordinary risk which the insurer ought to know. If a fire happens, either insurer ought to know. If a fire happens, either nished to replace the older destroyed, and labour. on the premises or in neighbouring premises, the

insurer cannot set up in defence that it was caused by the negligence of the insured or his servant, for these are generally the very things which an insurance is intended to guard against. When a fire happens, it is generally always provided by the policy that notice of the loss is to be sent in, and full particulars of the damage done, and the alleged value, for it is only the actual loss which is insured avainst, and that only can be recovered. Thus, if a person insures his house or furniture for \$600, and damage only to the extent of \$50 has been done by fire, he can only recover the \$50, for otherwise he we ild be better off that he was before the fire, and the contract is one merely of indemnity-i. e., it does not add to one's wearth, but merely secures against loss. It is often provided that the annual payment of the premium on a contract of insurance may be paid within 15 days after the first or previous year ment to be postponed so long, for if a fire happen in the interval, the insurer will not in general be liable. Sometimes the same property is insured in several offices, but in that case the insured party can nevertheless only recover the value of his loss once and no more. He can sue either of the insurers, however, for the amount, if each policy cover the whole value, and the party who pays can then recover a proportionate part from the other co-insurers, for they all divide the loss among them. In cases where carriers and others take out a floating policy of fire insurance, the carrier can sue for the full loss of the goods, though far exceeding the extent of his own interest in them, but in that case the owner of the goods destroyed is entitled to recover the balance from the carrier, even though originally he never gave authority to the carrier to insure them. And so, in like manner, if a person is insured, and recovers his loss from the insurer, and then sues a third party for the wrong which caused the loss, the insurer gets the benefit of what may thus be recovered, in diminution of his own loss. Life Insurance is not a contract of indemnity, like

fire insurance, and therefore a person may insure his life in as many insurance offices as he pleases, and his executors will recover the full amount insured from each of the insurers, regardless of the rest. In order, however, to insure a life, the insurer must either himself be 'the life' or must have a pecuniary interest in the life. Thus, a creditor is entitled to insure his debtor's life; a wife may insure her husband's, because he is bound to support her; or the husband may insure the wife's, if she has an annuity or property settled upon her for life, in which he has an interest. Formerly it was enough that the interest of the insurer existed at the time the policy was entered into, and a creditor whose debt was satisfied might recover on the policy; but recent decisions have reversed this, and some insurers also now provide that if the debt is paid, it must be paid to them. In entering into contracts of life insurance, scrupalous good faith is exacted in the description of the nature of the life insured, and any fraudulent misrepresentation in a material point is fatal to the insurer's right to recover. Some companies even go the length of inserting in their policies a clause, that if any misrepresentation (i. e., however trilling) be made, the policy will be void. But particular care should be taken to avoid such offices, for the policies taken out on such terms will generally be so much waste paper, as far as any security is concerned. At the same time, it is often dangerous for the insurer to treat lightly any misrepresentation, for in the end the question, whether it is material or not, will be one not for him or his executors, but for a tury, in case an action is brought. When the policy is affected through an agent on the principal's

life, and the agent, unconsciously and without the authority of the principal, makes a misrepresenta-tion, this will bind the principal. Where the person whose life is insured commits suicide, or is hanged, the policy is void, unless, in the case of suicide, he was in a state of insanity at the time. The policy, however, frequently has an express provision on this subject, the terms of which will be in that case allimportant, and will govern the liability. In case the policy provides, as it often does, for its continuance, if payment after the expiration of the tinuance, if payment after the expiration of the year is made within 15 or 21 days, it is dangerous to run the risk of this interval, for if the party dies during the 15 days before the premium is paid, the policy will not be set up by his executors coming forward to pay within those days. But the policy sometimes expressly allows of this, in which case it will be competent for the executors to make the payment. Life assurances are often assigned in security of a debt, in which case the assignor generally covenants to pay the premiums, so as to keep the security up; and failing payment by the assignor, the assignee is generally authorised to pay them himself, and recover the amount from the assignor. Notice of an assignment of a life policy should always be given to the insurance company, so as to let them know whom they are to pay,

Maritime Insurance is effected either on a voyage from one port to another, in which case it is called a voyage policy, or it is from one given day to another, in which case it is called a time policy. When the value of the property insured is expressed in the policy, it is called a valued policy, and when not so expressed it is an open policy. In general, wagering or gaming policies are void by statute, and the insurer must have some interest in the ship, such as the profits of the voyage or the freight. The insurance of seamen's wages, however, is not competent, for it tends to take away the stimulus of exertion from the crew. When the policy states a fixed sum as the value of When the poncy states a fixed sum as the value of the property, and expressly provides that the policy shall be deemed sufficient proof of interest, the insurance is an insurance 'interest or no interest,' and void by the statute. When the policy is a voyage policy, there is an implied warranty by the insurer that the ship is seaworthy at the commencement of the voyage, but there is no such warranty in a time policy. As is the case in fire and life policies, any fraudulent concealment of material circumstances which increase the risk will void the policy. But everything done in the usual course of navigation and trade is presumed to have been foreseen, and in contemplation of both parties. The policy is understood to cover the risk, not only of the perils of the sea, properly so called, but of ignorance or negligence on the part of the master or mariners. But the loss caused by mere tear and wear is not covered by the policy; the cause of the loss must be something fortuitous or accidental. Every policy impliedly assumes that the vessel will proceed straightway to her place of destination, without unnecessary delay. But sometimes, from unforeseen causes, it is absolutely necessary for the master to deviate, in which case, and in which only, the policy will remain good, strict proof, however, being always given of this imperious necessity. When the ship has been so injured or deterior-ated as to render it hopeless to restore it, and the repairs will cost more than the ship is worth, the assured may abandon the ship, and claim for a total loss. See AVERAGE.

under his orders are those in charge of all the finance services, the provisions, stores, hospitals, artillery train, and transport departments, besides the interpreters, guides, and such like temporary services. The intendent-m-chef of an army is the representative of the Minister of War; and, short of superseding the general's orders, can exercise, in case of need, all the functions of that high officer of state. The intendance is divided into intendants, ranking with assistant-intendants with majors; besides calets, who receive no pay, and constitute a probationary grade.

During the Crimena campaign, the necessity of such a department in the British service was keenly felt, when the independent action of different sections of the civil administration—as good individually as the French—often left the army in the utmost distress for supplies which were really close at hand. But the jealousy of the separate services at head, with other reasons among which was the difficulty of disposing of such a functionary during prace—to defeat any definite action in the matter, army which has most analogy to that of Introduction of the two are far from illentical.

INTERCALARY (Lat. intercalaris, for insertion), an epithet applied to these months or days which were occasionally inserted in the calendar, to make it correspond with the solar year. See CALENDAR.

INTERCE'SSION, DOCTRINE OF. Scripture, in many places, represents Christ, after having finished his redemptive work on earth, and ascended into his state of glory and exaltation, as ever pleading with God on behalf of those whom he has redeemed by the shedding of his blood (Rom. viii. 34; Heb. vii. 25; 1 John, ii. 1). Theologians say, however, that we are not to suppose that God needs to be interceded with, as if he were still reluctant to more merciful than before. They tell us, that since it is evident from the whole teror of the New Testament, as well as from a multitude of special passages, that the penal sacrifice of Christ on Calvary reconciled God to man, we must regard the intercessory work of Christ rather as serving to illustrate the eternal holiness of God and the changeless love of the Saviour, and as intended to keep continually in view the sacrifice of atonement on which it is founded. The doctrine of the intercession of Christ is held both by Protestants and Roman Catholics; but the latter, in addition, believe in the efficacy of the intercession of the Virgin and the saints, who, however, do not directly intercede for men with God, but with the Saviour, the sinless One, who alone has the ear of the King of the universe.

INTERCOLUMNIATION, in Classic Architecture, the distance between the columns of a building, measured at the bottom of the shaft. The intercolumniation varies in different examples, but the most favourite distance for the columns to be placed apart is 2th diameters of the column, which by Vituvius is called Enotife. The central intervention of the column of the column of the wide than the others when required for necess to a gate or door. In Doric architecture, the intercolumniation is decided by the spacing of the triglypla, the columns being insually placed under the centre of every other triglyph.

INTERCO'MMUNING, LETTERS OF, was an ancient writ issued by the Scotch Privy Council, warning persons not to harbour rebels.

INTERDICT, an ecclesiastical censure of penalty in the Roman Catholic Church, consisting in the withdrawal of the administration of certain sacraments, of the celebration of public worship, and of the solemn burial-service. Interdicts are of three kinds-local, which affect a particular place, and thus comprehend all, without distinction, who reside therein; personal, which only affect a person or persons, and which reach this person or persons, and these alone, no matter where found; and mixed, and these alone, no matter where found; and wheel, which affect both a place and its inhabitants, so that the latter would be bound by the interdict even outside of its purely local limits. The principle on which this ecclesiastical penalty is founded may be traced in the early discipline of public penance, by which penitents were for a time debarred from the sacraments, and from the privilege of presence at the celebration of the Eucharist; but it was only in the medieval period that, owing to circumstances elsewhere explained (see Excommunication), it came into use as an ordinary church coosure in the then frequent conflicts of the ecclesiastical and civil power. It was designed to awaken the national conscience to the nature of the crime, by including all alike in the penalty with which it was visited The most remarkable interdicts are those laid upon Scotland in 1180 by Alexander III.; on Poland by Gregory VII., on occasion of the murder of Stanislaus at the altar; by Innocent III. on France, under Philippe Auguste, in 1200; and on England under John in 1209. The description of England under the last-named interdict, as detailed by some of the contemporary chroniclers, presents a strangely striking picture of the condition of the public mind, which it is difficult with our modern ideas fully to realise or to understand. It would be a great mistake, however, to suppose that, during the continuance of an interdict, the people were entirely destitute of spiritual assistance. The interdict mainly regarded the solemnities of public worship; it was permitted to administer baptism, confirma-tion, and the Eucharist in all cases of urgency; to confess and absolve all who were not personally the guilty participators in the crime which the interdict was meant to punish; to celebrate marriage, but without the solemnities; and to confer orders in cases of necessity. And under the popes Gregory IX., Innocent III. and IV., and Boniface III., still further mitigations of its rigour were introduced, one of which was the removal of the interdict and restoration of public worship on certain great festivals, especially Christmas, Easter, Pentecost, Assumption, and All Souls. The council of Basel coacted very stringent rules as to the use of this penalty, and in later times the general interdiet has been entirely disused, although occasionally, in very special eircumstances, and to mark the horror of the church for some enormous erime, instances are still recorded in which a particular place or church has been visited with the penalty of a local interdict.

INTERDICT, in Scotch Law, is an order issued by the Court of Session to stop or probablit a person from doing an illegal or wrongful act. It is obtained on presenting a note of suspension and interdict to the Lord Ordinary on the Bils. The party applying for it must have both title and interest—that is, he must be more than a mere stranger. The principles on which it is granted in Scotland are substantially the same as those in which the parallel Writ of Injunction (q. v.) is granted by the Court of Chancery in England.

INTERDICTION is a process peculiar to the law of Scotland, by which persons of imbecile minds may either restrain themselves, if conscious of their weakness—then called voluntary interdiction—or may be restrained by the Court of Session in invitum, then called judicial interdiction. The effect of both is to appoint trustees or interdictors, whose consent is necessary to all deeds whereby the imbecile's heritable estate is alienated. See LURSCILLY.

INTERE'SSE TE'RMINI, a term sometimes used in English law to denote the kind of interest which a lessee takes in land when the lease is executed. It amounts to a right of entry on the

lands, which is assignable.

INTEREST, the payment due by the borrower of a sun of money to the lender for its uses. The interest of £100 for one year is called the rate percent, it menory lend, the principal; and the sum of any principal and its interest, the amount. The current or market rate of interest fluctuates widely, by reason, not, as is often supposed, of the extent of the supply of money, but of the variable rates of profit, as in Holland, where it has always been comparatively low, and in our own profits of the profits being in excess, the rate of interest is relatively high, and the profits being in excess, the rate of interest is relatively high.

tively high."

A strong prejudice against exacting interest existed in early times, arising from a mistakeu view of some enactments of the Mosaic law; *and as late as the reign of Edward VL, there was a prohibitory act passed for the alleged reason that *the charging of interest was a vice most odious and detestable, and contrary to the word of God. *Calvin, the famous reformer, was one of the first to expose the reror and impoley of this view, although a series of enactments, known as the Usur Laws, to some extent perpetuated it. by an attempted restriction extent perpetuated it. by an attempted restriction rate was fixed by act 21 James L. at 8 per cent. During the Commonwealth, it was reduced to 6 per cent; a tail of the material contract was fixed by act 21 James L. at 8 per cent. as which rate it stood till 1839, when the law was repealed. In Scotland, any charge for interest was prohibited before the Reformation. In 1857, the rate was fixed by law at 10 per cent; in 163, at 8 per cent; in 1661, at 6 per cent; and by the act of Anne, as above noted, at 5 per cent It is now admitted that the operation of such laws tended only to raise the real rate of interest, by driving men in distress to adopt extravagant methods of raising money—the bonuses thus paid being really and in effect an addition to the nominal being really and in effect an addition to the nominal

Interest is computed on either of two principles:

I. Simple interest, where, should the interest not be paid as due, no interest is charged upon the arrears. Although this mode of reckoning has little to recommend it in reason, it is adopted in many transactions, and receives the sanctino of the law. The computation of simple interest is easy, it being only necessary to calculate the product of the principal, the rate per cent, and the period in years and fractions of a year, the result, divided by 100, giving the sum required. Thus, wanted the interest of £256.66, 8.6, for 31 years at 4 per cent.

£356, 6s. 8d. for $3\frac{1}{2}$ years at 4 per cent. $356\frac{1}{2} \times 3\frac{1}{2} \times 4 \div 100 = £49, 17s. 9d.$ 2. Compound interest is the charge made where—the interest not being paid when due—it is added

the interest not being paid when due—it is added to the principal, forming the amount upon which the subsequent year's interest is computed. The rules for most readily making computations by compound interest can only be effectively expressed algebraically, and, using the symbols in article Discount, we annex a few of the elementary

ormulæ.

1. Since £1, increased by its interest r, at the end of one year becomes 1 + r, this amount at the end of the second year becomes (1 + r)², and generally at the end of the n*y year (1 + r)³. Example: To find the amount of £1, improved at 5 per cent for six years. r, the interest for £1, in 95, and n = 6; therefore (105)⁴ = 134, or £1, 6s, 94d. 2. Since £1 becomes in one year 1 + r, it is found by ordinary proportion that the fraction of £1 which will

amount to £1 in a year is $(1 + r)^{-1}$ (i. e., $\frac{1}{1 + r})$ = v; and reasoning as above, the sum which will amount to £1 in years hence is $(1 + r)^n = r^n$. 3. The amount of £1 in n years being $(1 + r)^n$, it will be seen that the excess of this sum over the original £1 invested, or $(1 + r)^n - 1$, is the amount of an annual increment or 'annuity' of £r for the period, mula for the amount of an annuity of £1 for the same time, being

 $\frac{1}{r}(1+r)^n-1.$

 Reasoning as in (3), the present value of an annuity certain of £1 for n years, or the sum which, improved at interest, will meet the annuity is

 $\frac{1}{r}\left[1-\frac{1}{(1+r)^n}\right]=\frac{1-v^n}{r}$

Tables for the four classes of values above classribed, based on various rates of interest, are given in most works on annuties. Those by Mr Rance are computed for each quarter per cent. from \(^1\) to 10 per cent. It may be useful to note two results that can be easily deduced from a table of the present values of annuties (4). I. The annutie the reciprocal of the corresponding value in such a table. Example: A person borrows £100, to be repaid by annuty in 15 years, with interest at 5 per cent.; required the annutiry? The present value of an annuty of £1 per annum for that period, at the rate stated, is £10.38, and 100 × 10.38 sq. 12.8 84.2. Z. To find the annutibe tract from the annuity that £1 will purchase, accertained as above, r, the interest of £1 for a year. Example: The annuity which, paid for 15 years, will amount to £1, taking interest at 5 per cent. is—

ill amount to £1, taking interest at 0 | Value of annuity which £1 will purchase as last found, Subtract r, at 5 per cent. 050000

Annuity required, . £046342 Or £4, 12s. 84d. will amount in 15 years to £100.

OF £4, 125. 84d. will amount in 15 years to £100.

INTERIST, IN LAW.—In England and Ireland, when a debt has been for some time due, there is no obligation imposed on the debtor by the importance of the control of th

See Exodus, xxii. 25; Leviticus, xxv. 39; Deuter-omy, xxiv. 19: the application being to money leat for the relief of distress, and not advanced to the borrower that he might improve it.

in the case of money due upon an award by an arbitrator, in which case interest is due from the day when the award was made. A third exception was in the case of a bond for money, in which case interest was added from the day it ought to have been paid. And lastly, if a surety had to pay money for his principal, he could recover it back with interest. In all other cases, if there was no express agreement about interest, none could be claimed. If, however, there was a course of dealing between the parties, or a usage affecting a particular trade to give interest, then, without express agreement, this was understood. A recent statute somewhat amended the above defect of the common law, for by 3 and 4 Will. IV. c. 42, s. 28, a jury may now add interest at the ordinary rate on all debts or sums certain, which are made payable under some written instrument at a certain time: and even if not due under a written instrument, then if a written demand has been made expressly giving notice that interest will be charged from and after the date of the demand, if not paid then, interest will also be demand, it not paid then, interest will also be due. But even in these last cases, it is discretionary in the jury to give the interest, and therefore it is not claimable as a matter of course. As regards compound interest, it is a fortiori not claimable in any case, except where it has been expressly stipulated for, or where there is in some particular trade a definite custom to pay interest, and such custom must always be proved.

It ought also to be added, that the Court of Chancery has always been in the habit of charging trustees who have misapplied funds with 5 per cent. interest on the amount, and also compound interest; but in simple cases of retaining moneys in hand without investing them, they have been charged 4 per cent. Formerly, it was prohibited by statute in England to lend money on the security of real estate at a higher rate than 5 per cent.; but these statutes have been abolished, and now any person may borrow or lend at whatever rate of interest he can agree with the other party. Pawnlrockers are allowed to charge interest not exceeding a fixed sum. See PAWNERGERS.

In Scotland, the law has always been much more liberal in allowing interest to be claimed on outstanding debts, for there the converse principle was acted on, that on nearly all debts whatever, interest was claimable either by statute or by common law. Thus, interest is due on bills of exchange, on the amount contained in a horning or charge to pay, on sums paid by cautioners, on the price of lands sold, on money advanced at request, on the price of goods sold, if the usual time of credit has expired, and generally on all debts which there has been delay in paying.

INTERFE'RENCE, a term employed to express the effect which rays of light, after being bent or diffracted, produce on each other. If the rays meet after diffraction, their light, when allowed to fall on a surface, will be divided into bars or stripes, alternately light and dark, as is shewn in the article DIFFRACTION (q. v.). This phenomenon has been made the touchstone of the two rival theories of light, the undulatory and the emission. According to the former, it is thus explained : if two luminous waves simultaneously impel a molecule of ether, its motion will be the resultant of the original impulses: and if the two motions (as in the case of diffraction) be nearly in the same direction, the resultant will be nearly their sum; if opposite, their difference. Thus, when a particle has begun to undulate from the action of a luminous wave, and if, while in motion, another wave impinge upon it, the result will be increase of light, if the motion of the second wave conspire with that of the first : but a decrease. if they oppose each other; and total darkness, if. while opposing, they are equal in velocity. Let d be the distance corresponding to a complete period of vibration; then, if the second wave impinge upon the molecule after it has accomplished one or more whole vibrations corresponding to the distances d, 2d, 3d, &c., and has returned to its original position, the two waves will evidently conspire together, and produce more violent motion; but if it impinge on the molecule, when the latter has only accomplished half a vibration, corresponding to distances $\frac{1}{2}d$, $\frac{3}{2}d$, $\frac{3}{2}d$, &c., then the wave will oppose the particle's return to its original position; thus producing diminution of motion, or, if equal, rest. In the former case, the intensity of light is increased; in the latter, diminished : and if the undulations are of equal velocity, the light is doubled in the first case, and destroyed in the second. The emission theory totally fails to explain interference. In light of different colours, the value of d differs for each colour, being least for violet, and greatest for red light. The principle of interference accounts in the most satisfactory way for the colours of thin plates, the fringes that accompany shadows, &c.; and its explanation forms the most decisive reason yet known for adopting the undulatory in preference to the emission theory of light. See LIGHT.

INTERJECTIONS are exclamations expressive not so much of a thought as of an emotion—as, ah; alas; hurrah; pooh; They are, therefore, hardly parts of speech, and never form part of a sentence. They are, in fact, more akin to the sounds emitted by the lower animals, than to articulate language.

I'NTERIM, in the history of the Reformation, the name given to certain edicts of the German emperor for the regulation of religions and ecclesiastical matters 'in the meantime' (Lat. Interim), till they could be decided by a general council. The first is the Ratisbon Interim, the result of the deliberations of a commission appointed during the diet of Ratisbon (Regensburg) in 1541, of which Eck, Pflug, and Gropper were the Roman Catholic, and Melancthon, Bucer, and Pistorius the Protestant members. On the greater number of doctrinal points, the commission found it possible to agree on terms which might be deemed consistent with the views of both parties; but as to the sacraments and the power of the church, the differences were irreconcilable. By the Protestants in general, the whole movement was looked on as a scheme to entrap them into a formal return to the Church of Rome. At the next diet, at Augsburg in 1548, a new interim was by the emperor's command pre-pared by Pflug, Helding (Sidonius), and Agricola. It is called the Augsburg Interim. In it the use of the cup by the laity, the marriage of priests, and some other minor things, were conceded to the Protestants: but it met with very general opposition, particularly in the north of Germany, and was revoked in 1552. By the exertions of the Elector Maurice of Saxony, a third interim, the Leipsic Interim,

was adopted at the diet of Leipsis on 22d December, 1548, which guarded the Protestant creed, but admitted great part of the Roman Catholic cormonial, and recognised the power of popes and bishops, when not abused. But the offence given to the more zealous Protestants by this interium, which Melancthon, Bugenhagen, and Major supported, led to division in the Protestant Church.

INTERLA'KEN ('between the lakes'), a village of Switzerland, is delightfully situated on the right bank of the Aare, in a plain between Lakes Thun and Brienz. Along the Wahnut Avenue or Highway, between the lakes, there is an almost uninterrupted | that the country affords. Ten miles southward is line of hotels or pensions. Within a few miles of the Stanbbach (the 'sky-born waterfasil'), with its the yillage are many of the most wonderful sights | perpetaal firs; a few miles waterfasil', but had in

View of Interlaken and Unterseen.

full view from the village, are the magnificent Jungfrau and several other remarkable peaks of the Bernese Alps. The visitors are the chief source of income to the inhabitants, who number from 1000 to 2000.

INTERLINEA'TIONS in a deed are additions or corrections written either on the margin or between the lines. In England, interlineations in a deed are not fatal, provided only it is proved that they were made before executing the deed. It is usual to put the parties' initials opposite the place where the interlineations occur, in proof of this, or at least by way of memorandum. In affidavits and at least by way of memorandum. other documents, the initials should also be put at the places interlined. In Scotland, if the interli-neation is at all material, it ought to be signed by the parties, and the fact mentioned in the testing clause, otherwise it will be presumed that the interlineations were made after the execution, and will vitiate the deed.

INTERLO'CUTOR, in Scotch Law, means a finding or judgment of a judge or court in a cause. In England, the word is not used.

INTERLO'CUTORY JUDGMENT, in England, Ireland, and Scotland, means a judgment which is not final, but which is merely a step in the suit or action. So as to interlocutory decrees or orders.

I'NTERLUDE, in Music, is a short melodious phrase played by the organist (generally extempore) between the verses of a psalm-tune. In the German Protestant Church, the interlude (or zwischenspiel) is generally played between each line of the verse, to give the congregation time to breathe. To accompany the chorale of the Lutheran Church with scientific and appropriate interludes, is reckoned in Germany the chief test of a good organist.

and the act has been condemned and prohibited. and the far has been conditioned and promines. The physical deformity and mental debasement of the Cagots of the Pyrenees, of the Marrons of Auvergne, of the Sarrasins of Dauphiné, of the Cretius of the Alps, and the gradual deterioration of the slave population of America, have been attributed to the consanguineous alliances which are unavoidable among these unfortunate peoples. More recently, the same opinion has been supported by the history of deaf-mutism and of idiocy. Of 235 deaf and dumb children whose parentage could be traced, 70, or nearly 30 per cent., were the offspring of the intermarriage of blood-relations. But in opposition to, and apparently destructive of such an hypothesis, may be adduced the unim-paired condition and symmetry of the Jews, of the small Mohammedan communities in India, the isolated tribes in North America, among whom the repeated intermarriage of near relatives is compulsory. Moreover, this opinion does not hold in the analogous cases among the inferior animals, as the Arabs can trace the pedigree of their most valuable horses to the time of Mohammed, whilst they avoid all crossing; the stud-books in this country record the ascendants of racers for 200 years, and shew the perpetuation of the qualities of strength, and weight, and fleetness by propagation within the endowed family, both Eclipse and Childers being descended from a horse the offspring of a parent and foal; and the descendants, again, of these horses, which still maintain the highest estimation, afford many instances of very close breeding; and lastly, many instances of very close freeting; and assay, the Durham ox and the Ditchely sheep were the result and triumph of breeding in and in. The present state of the controversy, as it has been recently conducted in France, may be summed up in the proposition, that consanguineous alliances are Germany the chief test of a good organist.

INTERNARRIAGE. The internarriage or intercourse of near relatives has been universally believed to entail degeneration upon the offspring, that such generalisations should be received with caution. It should be added, that even were it established that mental disease generally followed established that mental disease generally followed upon the increased certainty of reproducing hereditary tendencies, than upon the violation of any physiological law.—Steinau, Essay on Herreldurg Dosense and Internarriage; Devay, Du Donger Gotton Committee, 1862; Darwin, Animals and Plants under Domestee, 'no (1869); and The Origin and Descent of Men. Sec. (1870).

INTERMEDIATE HARMONIES, in Music, are the harmonies introduced between extreme non-related keys, while modulating from the one key to the other, which harmonies prepare the ear to receive

the new key.

INTERMEZZO, a short dramatic comic scene, with singing, peculiar to the Italian stage, and introduced between the acts of an opera or play.

INTERMITTENT FEVER. See AGUE.

INTERNA'TIONAL LAW is divided into public international law and private international law.
I. Public International Law, or the law of nations, consists of those rules which independent nations agree among themselves to be just and fair in regulating their dealings with each other in times of war and peace. The mode in which they arrive at this common understanding of what is just and fair, is by comparing the opinions of text-writers who profess to set forth and collect the general opinion of civilised nations, for all these writers anneal ultimately to the principles of natural reason and common sense, as the test of what they profess to be the proper rule. Treaties of peace, alliance, and commerce also define and modify the existing international law as between the contracting parties. The decisions of prize-courts, which profess to pro-ceed on principles of natural justice, of universal application, are also declarations of this international law. The leading doctrines thus adopted are as follows: A sovereign state is one which governs itself independently of foreign powers. In the event of a civil war in one nation, other nations may remain indifferent spectators, and treat the uncient government as sovereign, and the government de facto as entitled to the rights of war against its enemy. the foreign state profess neutrality, it is bound to allow impartially to both belligerent parties the free exercise of those rights which war gives to public enemies against each other, such as the right of blockade, and of capturing contraband and enemy's property. Where a colony or province asserts its independence, and has shewn its ability to maintain this independence, the recognition of its sovereignty by other foreign states is a question of policy and prudence only; but until acknowledged, courts of justice and private individuals are bound to consider the ancient state of things as remaining unalt-red. When a change occurs in the person of the severeign, or in the internal constitution of a state, all treaties made by such state which were not personal to the former sovereign, continue to

All sovereign states are, in the eye of international law, on a footing of equality. Each state has the right to require the military service of its own people for purposes of self-defence, and to develop all its resources in the manner it thinks fit, so long as it does not interfere with the same equal rights of other nations. When, however, one state unduly aggranuless itself, and augments its military and naval forces beyond what all the other states considered the self-defence of the self-defence of the ever, is considered a delicate business, and not to be attempted rashly; and it is difficult to define

be binding on the succeeding sovereign.

what is a just ground of interference. The acquisition of colonies and dependencies has never been considered a just motive for such interference, According to Wheaton (International Law, 88, 6th ed.), interferences to preserve the balance of power have been generally contined to prevent a sovereign, already powerful, from incorporating conquered provinces into his territory, or increasing a dictatorial influence over the councils and conduct of other independent states. The aversion to interference has no doubt, in modern times, become stronger and stronger; and it may be taken to be now almost an axiom, that no foreign state has any just ground of interfering in what is merely an internal revolution of a state, or a mode of readjusting its own constitution; in short, each state ought to be allowed to manage its own internal affairs, and to choose whatever form of government best suits the people, for the exercise of this right can, in general, nowise affect other states.

Each state has the natural right to make its own laws regulating the property and status of all the subjects within its territory. On the high seas, both the public and private vessels of every nation are subject to the inrisdiction of the state to which they belong. Offences there committed against its own municipal laws give to the state to which the vessels belong jurisdiction; but no right of visitation and search belongs to a nation in time of peace, though piracy and other offences against the law of nations, being crimes not against any particular nation, but against all mankind, may be punished by any state in which the offenders can be found. The traffic in slaves is, however, not classed with piracy by the law of nations, though nations may declare it to be so as regards their own subjects; and they may also enter into a compact as to that matter, as has been done by Great Britain with other nations. With regard to crimes and their punishment, though each state will punish all crimes by whomsoever committed, if committed within its own territory, and also all crimes committed in its public and private vessels on the high seas, or in a foreign port; likewise all crimes, wherever committed, by one of its own subjects, yet it cannot arrest one of its own citizens if he is within the territory of another state; to do so would be an invasion of the municipal law of that state; hence it can only arrest its criminals in foreign states by the leave of such state, and such state is not bound to accede to such a request. Hence arises the expediency of two states entering into an extradition treaty, by which they bind themselves to give up to each other criminals who have committed certain specified offences.

There are certain usages or ceremonials of respect shewn by one nation to another in certain circumstances, and these are founded on the theory of the equality of sovereign states. As regards the right of precedence among kings, emperors, and princes, there is nothing settled and binding, except, perhaps, that Catholic powers concede the precedency to the pope. But as regards minor matters, it is the settled courtesy for one nation to salute by striking the flag or the sails, or by firing a certain number of guns on approaching a fleet or a ship of war, or entering a fortified port or harbour. Sometimes these ceremonials are regulated by express treaty, as, for example, as regards the maritime honours exacted by Denmark from vessels passing the Sound and Belts at the entrance of the Baltic

The rights of states in time of peace consist of the rights of legation and of negotiation. Every independent state has a right, in point of courtesy and usage, to send public unnisters or representatives

COD

to, and receive ministers from, any other sovereign effect to those laws so far as they do not conflict state with which it desires to maintain relations of peace and amity. See Ambassador; Envoy;

CHARGÉS D'AFFAIRES: CONSUL.

When war is commenced between two countries, there are certain rights acknowledged to exist towards each other. Before war is proclaimed, intermediate methods are sometimes adopted, with a view to avoid that last necessity; these are laying an embargo on the ships or property of the offending state found in the territory of the offended state; also taking forcible possession of the thing in controversy, also retaliating and making reprisals. When war is once declared, the first step is to seize and confiscate all the enemy's property within the territory. It becomes unlawful for the subjects of each belligerent state to trade with the subjects of the other belligerent. The test of whether a person is a subject of either state is generally his domicile; so the character of ships depends on the national character of the owner, as ascertained by his domicile. As regards the conduct of one belligerent state against the other, some writers have laid it down, that everything is fair against an enemy, and that no means of punishment are too severe; but this rigid rule has been qualified by the more humane practice of modern times. Instead of putting prisoners of war to death, the practice is to exchange or discharge them on conditions. Instead of indiscriminate destruction of the enemy's property, temples, public edifices, monuments of art and science, are spared. The laws of war are more and science, are spared. The laws of war are more unsparing at sea than on land; the practice prevails of commissioning privateers to prey on the commerce of the enemy, the captor lening in general entitled to the property. When property taken is recaptured, states differ as to the mede of dealing with the property recaptured. The validity of a capture at sea must be determined in a prize court of the captor's country or of an ally, and the prize court professes to act on universal principles applicable to all countries.

As regards neutrals in time of war, the leading doctrines are stated under the heads Contraband;

BLOCKADE; FOREIGN ENLISTMENT ACT.
At the Congress of Paris, 1856, the ambassadors

of Great Britain, France, Russia, Austria, Prussia, Turkey, and Sardinia, agreed to a joint declaration, modifying the state of the laws of war as follows: 1. To abolish privateering; 2. To adopt the maxim, free ships free goods —i.e., an enemy's goods shall not be taken in a neutral ship unless they are contraband of war; 3. To allow a nentral's are contraband of war; 3. 10 allow a neutral's goods in an enemy's ship to be free except as to contraband; 4. To abolish blockades unless they are real, and kept up by an effective force. These declarations were not acceded to hy America, because decirations were not acceed to figure and it objected to the abolition of privateering, so that though, in the event of war between the countries which agreed in the declaration, the above modifications will probably be adopted, this will not be the case in the event of America being at war with one or other of these parties. See Wheaton's International Law; Mackenzie's Studies in Roman Law; Macqueen's Chief Points in the Laws of War.

2. Private International Law is that collection of laws that regulates the mode in which ordinary courts of justice administer the remedies and give effect to the rights of parties where such rights were acquired partly or wholly in a foreign country, and where different remedies must otherwise have necessarily applied. In such cases, the court which administers the remedy, acting on what is called the courtesy of nations, or comitas gentium, endeavours

with the native laws in essential principles. The fundamental doctrine which underlies this branch of law is, that each subject of a foreign independent state is entitled to have the protection of his own laws, so far as is compatible with the equal independence of the state whose courts administer the remedy, and hence, though a court can in general only administer the laws of its own state, it may, pro hac vice, incorporate part of the foreign laws as part of its own remedies. Accordingly, in carrying out this doctrine, certain fair and equitable rules are adopted in dealing with foreigners in certain situatious, the chief of which arise out of the heads of marriage, death, intestacy, and remodies generally.

This branch of the iaw has been long cultivated by the continental countries of Europe, where many learned jurists have discussed its principles. probably owing to the insular position of the United Kingdom, little attention was given to it there; and indeed no work even incidentally treated of the subject until Mr Justice Story, an American judge, in 1834, first produced his celebrated treatise on the Conflict of Laws, and gave to British lawyers a methodical view of the results at which foreign jurists had arrived. In the United States, where each independent state had its own municipal laws, which often differed materially from those of the other federal states, it was natural and inevitable that some system should be adopted as to the way each state should deal with the rights of persons coming from the neighbouring states; and hence America preceded England in the development of this branch of the law. Story's work is still the standard authority in the United Kingdom. Since the laws of Scotland differ in many respects from those of England and Ireland, and each country has its own courts exercising independent jurisdiction, it is a matter of course that questions of conflict under these two codes of law should often arise. Not only do the courts of Scotland and England treat the laws of the other country as foreign laws, and deal with each other in much the same way as they would deal with France or any other foreign country, but the laws in other respects are materially different, and give rise to conflicts. On this particular branch of the law affecting England and Scotland, Mr Paterson's Compendium of English and Scotch Law contains a summary of all the material differences existing between the laws of these two countries, that are of the greatest practical importance to residents in the United Kingdom. As regards marriage, the leading doctrine of the

comi'as gentium is, that it is immaterial in what part of the world a man is married provided part of the world a man is married according to the law of the place where he then is, such marriage will be held a valid marriage all the world over, and wherever he goes. This doctrine, however, is qualified in this way, that the lex loci contractus—i. e., the law of the place where the marriage was contracted—shall regulate the validity of the marriage only so far as any ceremony is essential to the institution of marriage; but it is not allowed to dictate who the parties are who may validly marry, nor to vary any essential part of the contract. The reason of essential part of the contract. The reason of the latter qualifications is, that there may be rules of policy in one country which may prohibit marriages between certain persons, or may prohibit certain consequences, and therefore the evasion of the native law by persons going abroad for such a purpose is not to be tolerated. For example, in Scotland marriage is treated as a mere contract, to put the parties in the same position as if they which requires no particular ceremony beyond mere were still bound by the foreign laws, and gives mutual consent; whilst in England some ceremony

is absolutely essential-viz., the ceremony of the marriage being celebrated in a parish church by a priest, or in a superintendent-registrar's office, there is no priest. Accordingly, any two Euglish persons may go to Scotland, and he married there by exchanging a mutual declaration of marriage, and they may immediately return to Eugland, and will be there and everywhere else held to be married persons. On the other hand, if two Scotch persons go to England, they cannot be married by exchanging mers verbal declarations; they must be married, according to the English law, either by a priest in a church, or without one in n superintendent-registrar's office; and if so, they will be held to be married all the world over. Again, the law of England declares that no marriage shall be valid within certain prohibited degrees, and amongst others no man is there allowed to marry his deceased wife's sister. Hence, if a man and his deceased wife's sister go from England to Denmark, where the law allows such persons to marry, and they there are married according to the form there prevailing, and then return to England, where their domicile is, they will not be treated as married persons, because they went to evade their own law in a matter which is considered of vital importance. It would, however, be different if a man and his deceased wife's sister, who were Danes, and domiciled in Denmark at the time of their marriage, came afterwards to this country; they would in that case be treated as properly married, for their domicile was then Danish, and they had a right to follow their own law.

Another important head of international law is as to the law which regulates the succession to the property of a person deceased. On this subject, the rule is, that it is the law of the country in which a nan was domiciled at the time of his death which regulates the succession to his personal property, even though such property is scattered over all parts of the world; hence, it is necessary first to ascertain where the deceased person had his domicile. See DOMICILE. The above rule as to the domicile of a deceased person governing the succession applies only to his personal property; as to his landed or real property, the succession to it is governed by Hence, if an Englishman dies domiciled in England, leaving a Scotch estate, such estate will descend necording to the Scotch, and not the English law, and it is well known the rules of succession differ materially in the two countries. See Paterson's Compendium of English and Scotch Law. Where the person does not die intestate, but leaves a will, then it is merely statute, almost immaterial whether his will was made according to English or

Another important head of private international law is as to the court in which a remedy can be obtained on ordinary contracts. The rule is, that wherever a contract was made, the contract must be valid according to the law of the place where it was made, but the remedy may be had anywhere else wherever the defendant can be found. Thus, if a person makes a contract or incurs a debt in Scotland, and afterwards goes to England, he may be sued in the English courts, though the English court will only allow the remedy, provided the contract was valid according to Scotch law. It follows also from this rule that if a debt be incurred in Scotland which would prescribe in three years, yet, if the debtor be in England, he can be sued any time within six years, for follows that there can only be six different intervals that is part of the English remedy. It is often in the natural diatonic scale until the octave of the

rule is, that one must follow his debtor, and sue the debtor in whatever country such debtor resides. In this respect, however, Scotchmen have greater advantages over Englishmen than Englishmen over Scotchmen, for while the rule in England is, that a Scotchman can only be sued there in ordinary cases, provided such Scotchman is actually present in England, and can be personally served with process of the court - i. e., with a copy of a writ of sum-mons—in Scotland the rule is, that in many cases an Englishman can be sued though he never in his life were in Scotland at all; it is enough if he has some debt due to him there, or has left some trifling article of property-such, for example, as his umbrella - which can be arrested. In the latter case, the chattel or debt is first seized by the Scotch creditor, in order to found jurisdiction. or, as it is technically called, arrestum jurisdictionis fundandee causa, and then the Englishman can be sued, and judgment may be obtained against him in his absence, even though he never heard of the action. Englishmen have often complained of this as a barbarous practice of the Scotch courts; nevertheless, the very same practice exists in the city of London, though nowhere else in England. When judgment is once obtained either in Eng-land, Scotland, or Ireland, it is not competent for the judgment creditor at once to imprison or seize the goods of the debtor in either of the two other countries, if in the meantime the debtor has action in the new country to which the debtor has removed, and go through precisely the same process again. This circuitous process has been sought of late years to be remedied by an act of parliament, which, however, has hitherto been successfully opposed in parliament, on the ground that so great a facility of pursuing a debtor may be abused.

INTERPLEA'DER SUIT is a suit brought in the Court of Chancery in England or Ireland to determine which of several parties claiming the same thing is entitled. Formerly, there was no analogous process in courts of common law whereby several parties claiming one thing could be brought into the field to contest their claims, but in 1831 a statute gave power to do this to a limited extent. The corresponding process in the law of Scotland is an action of Multiplepoinding (q. v.).

INTERPOLATION, the insertion of a word, line, verse, sentence, part of a sentence, or whole passage, generally with a view to secure respect for some opinion by the apparent support of antiquity, or of those whose authority is greatest. Many instances of interpolation are well known, and others are with great probability suspected, in which the works of early Christian writers have been tampered with, to make them yield support to novel doctrines and practices. In mathematics, interpolation is the insertion between two members of a series increas-ing according to a certain law, of other members such as, if not absolutely, yet very nearly, may accord with the same law.

I'NTERVAL, in Music, is the difference of patch between sounds in respect to height or depth, or the distance on the stave from one note to another, in opposition to the unison, which is two sounds exactly of the same pitch. From the nature of our system of musical notation, which is on five lines and the four intervening spaces, and from the notes of the scale being named by the first seven letters of the alphabet, with repetitions in every octave, it what country a person may be sued. The general lind the following intervals; thus, C to D is a second; C to E is a third; C to F is a fourth; C to G, a fifth; C to A, a sixth; C to B, a seventh; and from C to C is the octave, or the beginning of similar series. Intervals above the cetave are therefore merely a repetition of those an octave lower; thus from C to D, above the octave, although sometimes necessarily called a ninth, is neither more nor less than the same interval which, at an octave lower, is termed the second. A flat or a sharp placed before either of the notes of an interval docs not alter the name of the interval, although it affects its quality; for example, from C to G is still a fifth, notwithstanding that the G is raised a semitone by the sharp. Intervals are classified as Perfect, Major, and Minor. Perfect intervals are those which admit of no change whatever without destroying their consonance; these are the fourth, fifth, and the octave. Intervals which admit of being raised or lowered a semitone, and are still consonant, are distinguished by the term Major or Minor, according as the distance between the notes of the interval is large or small. Such intervals are the third and sixth; for example, from C to E is a major third, the consonance being in the proportion of 5 to t, when the E is lowered a semitone by a flat, the interval is still consonant, but in the proportion of 6 to 5, and is called a minor third. The same description applies to the interval of the sixth from C to A, and from C to A flat. The second and seventh, though reckoned as dissonances, are also distinguished as major and minor. The terms 'extreme sharp' and 'diminished' are applied to intervals when they are still further elevated or depressed by a sharp or a flat. For the mathematical proportions of intervals, see Harmonics.

INTE'STACY, the state of a person who has died without leaving a will. Every person in the United Kingdom has the right, as one of the incidents of ownership, of regulating the succession of his property after his death; that is, of executing a will which must comply with certain requisites, so as to shew that it was solemnly and deliberately made, by which will the owner can give his property to whomsoever he pleases. The forms in Scotland differ from those in England and Ireland, and there is some restriction on the right Ireland, and there is some restriction on the right of testing or bequeathing property, but in all places the principle is, that if no will, or deed equivalent to a will, is executed, or, if a will executed is invalid from defect of form, then an intestacy occurs, and the law provides an heir or next of kin, in lieu of the owner himself doing so. See Heir; Succession; Will. A person may die partially intestate, for his will may have included only some of his property, in which case the property so included goes to the heir-at-law, or next of kin, according as it is real or personal estate, or kin, according as it is rear of personal cases, as if no will had been made. But it is often a difficult question in construing the will, whether the property not specially mentioned was not conveyed by general words to the residuary legatee or devisce-a question which turns entirely on the language used in each case.

INTE'STINES. See DIGESTION, ORGANS AND PROCESS OF.

INTO'NING, according to the general use of the word, is the recitative form of offering prayer. Intoning differs from ordinary reading in having fewer inflections of the voice, and these only at stated parts of the prayers, and according to certain rules. The greater part of the prayer is recited on one note, the last two or three words being sung to the proximate notes of the scale. In the longer prayers, the terminal inflection is generally omitted. The words Intoning and Chanting are sometimes

used interchangeably, but, though there is ground common to both, each has a domain peculiar to itself. Intoning may be defined as ecclesiastical recitative, and when several voices are employed in its performance, they sing, for the most part, in unison, breaking into harmony at the termination of the clause or sentence. Chanting embraces recitative and rhythm, both divisions being in continuous harmony. In the Auglican service, as performed in cathedral churches, all those parts of the ritual, speaking generally, which are not set to rhythmical music, are intoned; these embrace that part of the morning and evening service which precedes the daily

psalms, the litany, and the prayers in general John Marbeck (1550) was the first in England to adapt the offices of the reformed church to music : his work contained melody only. He was followed by Thomas Tallis, who flourished during the reigns of Henry VIII., Edward VI., Mary, and Elizabeth. The grave melody (founded on the ancient usage) and sublime harmonies of Tallis have never been equalled, and have continued in use till the present day with but slight modification. Tallis seems to have invented the form of the Anglican chant now used for the psalms. In the Roman Catholic Church these are sung to the Gregorian tones. See GREGORIAN CHANT. The canticles are sung to rhythmical music of a more elaborated character, in which form they are technically named 'Services.' The lessons, previous to the last review (1661) of the Book of Common Prayer, were intoned; since then, the invariable practice has been to read

The practice of intoning existed among the Jews at a very early period, and there is great probability that the ecclesiastical chant in present use throughout Christendom is but a modification of that which formed part of the ancient Jewish ritual. The eastern and western churches, at variance on most points, are at one on this. Mohammedans also make use of this mode of prayer; and barbarous tribes (American Indians and South Sea Islanders) are wont to propitiate their false gods in a species of rude chant; all which seems to point to some deeply seated instinct of human nature, and to indicate an intuitive perception of the truth, that a solemn and reverential manner, distinct from his manner of ordinary intercourse with his fellows, best befits the creature in his approaches to the Creator. The Lutheran Church and the Church of England have continued the practice, though only to a permissory and non-essential extent. The latter uses it in her cathedral and collegiate churches, and in these vast edifices its advantages over reading are strikingly manifest.

INTOXICA'TION. Whether induced by fer-mented liquors or by distilled spirits, it is through the alcohol contained in either that the effects of intoxication ensue. These may be considered under two heads: 1. As they immediately manifest themselves during a single act of intoxication; and, 2. As they gradually arise through the frequent repetition of the act. The one refers to the state of drunkenness simply, the other to the habit

(Intemperance).

The effects of alcohol, in a single act of intoxication, vary according to the way in which the spirit has been taken. If swallowed rapidly, in large quantities or in a concentrated form, the agency is that of a powerful narcotic poison. The agency is that of a power in national poison. The mode of action here is partly through a direct impression by the alcohol on the nerves of the stomach, and partly by its absorption into the blood, and its transmission thus to the brain, which is proved to take place with great rapidity. individual falls into a deep stupor, from which it

is impossible to rouse him. The face is ordinarily exhaustion. Even prior to this, the drunkard is ghastly pale. The skin is covered with chilly ghastly pale. The skin is covered with chiny damps; the pulse is feeble, or perhaps wholly imperceptible; the breathing is slow and weak, though sometimes laborious and snorting; the eyes are rolled unwards, with contracted or, occasionally, ddated pupils; the jaws are clenched, and there are frequently convulsions. Where death follows, it may ensue in a few minutes, or after to now, it may ensue in a new minutes, of anter n period varying from a single hour to a day. Where the quantity taken is swallowed more slowly, as in ordinary drinking, the consequences are those which are too familiarly known as characterising a fit of drunkenness, and are the product of the more gradual and less excessive absorption. The first effect is that of a feeling of wellbeing, diffused over the body, and imparted to the mind. This gradually leads to a state of exhibaration, and thence to boisterous mirth and loquacity, attended at first by a swift transition and vivacity of the ideas, but speedily lapsing into indistinctness and confusion. In the increasing whirl of excitement, the individual loses all sense of prudence and self-government, betrays himself by his indiscretions, provokes pity and ridicule by his follies, or incurs danger by his recklessness. Along with this mental condition, the flushed face, flashing eye, and throbbing brain shew, at first, the corresponding state of excitement of the bodily functions; while, along with the subsequent confusion of thought, the reeling gait and the look of stolid incomprehension denote the enthralment that has followed. In a further stage, the memory fails, the individual maunders and mumbles in his speech, and the surrounding objects, recently seen imperfectly and misapprehended, wholly cease to impress him. At length, amid other loathsome concomitants, he sinks powerless, and stupor intervenes, from which he again awakens to consciousness after an indefinite number of hours; but then usually to suffer from qualms of sickness and other feelings of pain and depression, entailed upon him by a natural law as the reaction entailed upon him by a natural raw as the reaction from his excess, and only dispelled after a still longer interval. The outline of the effects may vary. With some, the progress of a fit of dranken-ness is never attended by hilarity or other con-spicious excitement, and a dreamy and subdined forgetfulness seems all that is produced or that is sought for. With some, even, it leads to a state of querulousness or of unreasoning melancholy. others, the condition is one of furious madness, hesitating before no extreme of violence and outrage.

It is chiefly to the after-effects of the paroxysm that we are to trace the original growth and ultimate inveteracy of the drunken habit. The uneasy sensations of depression, following upon the excitement of the previous debauch, are sought to be relieved by a fresh recurrence to the stimulant; and a morbid appetite is thus created which craves its relief, and finds it, in the renewed administration of spirituous drinks, just as the natural appetite of hunger develops those sharp disquietudes that are allayed by food. This morbid appetite, in so far as it is morbid, may in itself be regarded and treated as a disease. But the universal health shows ultimately signs of a more deep injury. The cheeks begin to have a bloated and flabby look, with a complexion that either wears a peculiar pallor, or verges into shades of purple, while the nose not rarely presents a suspicious tinge of crimson. The appetite for ordinary food fails, the digestion is impaired, the sleep is disturbed, and the vigour of impaired, the steep is utterment and the vigour of route and improvement Act of Soutand, 25 and 20 frame and capacity for exertion sink accordingly, liet. c. 101, z. 254, subjects drunken persons in the limbs often aching and trembling, and the streets to a penalty of 40s, or 14 days 'imprisonment, leart drooping, with a miserable feeling of nervous in all places where that act is adopted.

livid, with a swollen aspect, but sometimes it is often liable to those minor illusions which end in the full development of what is known as the drankard's delirium, or delirium tremens, a form of temporary insunity characterised by a state of abject terror, with shaking of the limbs, the sufferer fancying that he is surrounded with monstrons phantasms, or that he is devoted otherwise to horrors, disasters, or crimes. One effect, and a leading one, of the customary presence of alcohol in the blood of the drinker, is to reduce the vitality of that fluid, so that it tends to sustain only the lowest forms of nutrition and animalisation, and deposits, in great part, merely an inert fat within those organs where it should minister to the growth and maintenance of a delicate construction, destined for uses essential to life. Thus we have fitty deposits, or changes of higher structures into fat, in the heart, the liver, and in the blood-vessels, the coats of the last becoming easily ruptured. Hence, liability to diseases of the heart and of the liver often followed by dropsies, or to affections of the other intestines, or to attacks of apoplexy and palsy. If not cut off abruptly in his career, the life of the drunkard becomes one long malady towards its close, the final condition being usually one of imbecility of mind and body, yet with throes of suffering to the last. It has been authoritatively shown that, while the average expectation of future life to the temperate man at fifty may be reckoned at twenty years, that of the drunkard at the same age is only four years. Again, between the ages of twenty-one and thirty, the deaths among drunkards have been found to be more than five times, and between thirty-one and fifty, more than four times the proportion of those occurring among the general community at the like ages,

INTOXICATION, OF DRUNKENNESS, is, in point of law, no excuse for any wrong done by the drunkeu party. Crimes which are committed in a state of drunkenness are punishable in the same way as if the actor were soher, though it is discretionary in the court to mitigate the sentence. As regards contracts entered into by a drunken party, there is no peculiarity, unless the fact of drunkenness was taken advantage of by the sober party, in which case it lies on the drunken party to prove this. Cases may no doubt arise where the drunkenness may be an element of fraud, and so the contract or deed may be rescinded or set aside. The mere act or state of drunkenness, when privately indulged in, is not an offence against the law; but if it be shewn in public, it may become so. If, for example, a person be drunk in the streets or a public place, he was made, by a statute of James 1., liable to be fined 5s., or, if unable to pay, to be committed to the stocks for six hours. By a more modern enactment of 1860, called the Refreshment Houses' Act, 23 Vict. c. 27, every person found drunk in any street or public thoroughfare, and who, while drunk, is guilty of riotous or indecent behaviour, incurs a penalty of 40s.; and if a person is drunk, riotous, quarrelsome, or disorderly in any public-house, beer-house, or refreshment-house, and refuses to leave the premises on request, he incurs a penalty of 40s. The above enactments are of general application in England, but there are also similar enactments in many local improvement and police acts regulating large towns. In Scotland, several ancient statutes were passed against drunkenness, which, however, are in desuctade. In several local police acts, a penalty is imposed on drunkenness in the streets, and the Police and Improvement Act of Scotland, 25 and 26

INTRA'DOS, the under or inner side or soffit of an Arch (q, v,), the upper or outer curve being called the extrados.

INTRE'NCHMENT, in a general sense, is any work, consisting of not less than a parapet and a ditch, which fortifies a post against the attack of an enemy. As a means of prolonging the defence in a regular work of permanent fortification, intrenchments are made in various parts, to which the defenders successively retire when driven in from forward works. Bastions are ordinarily intrenched at the gorge by a breastwork and ditch, forming other a re-entering angle or a small front of fortification. Such a work across the gorge of the Redan at Sebastopol caused the repulse of the British attack in September 1855. A cavalier, with a ditch, is also an intrenehment. An army in the field often strengthens its position by intreuchments, as by a continued line of parapet and ditch, broken into redaus and curtains, or by a tine with inter-vals, consisting of detached works of more or less pretension flanking each other.

INTRODU'CTION (Ital. introductione), in Music, is a kind of preface or prelude to a following move-Formerly, the introduction was only to be found in large musical works, such as symphonies, overtures, oratorios, &c.; but now it is found in

sense, introduction is applied to the piece of music with which an opera begins, and which immediately follows the overture. In some cases, the overture and introduction are united, the composition going on without any formal pause, as in Gluck's Iphigénie en Tauride, Mozart's Itomenso and Don Giovanni. As the overture, which contains a harmonical sketch of the opera. should make a permanent impression on the audience, the custom of uniting it with the introduction has very properly been discontinued, and the introduction treated as an independent movement.

INTROMI'SSION, in Scotch Law, is the assumption of legal authority to deal with another's property. It is divided into legal and vicious. Legal intromission is where the party is expressly or impliedly authorised, either by adjudgment or deed, to interfere, as by drawing the rents or getting in debts. Vicious intromission is where an heir or next of kin, without any authority, interferes with a deceased person's estate; as, for example, where a person not named by a will, or without the authority of any

will, collects the property of the deceased person, as if he were regularly appointed, so doing, the vicious intromitter incurs the responsibility of paying all the debts of the deceased. The vitiosity, however, may be taken off by the intromitter heing regularly confirmed executor. The corresponding phrase in Eugland to a vicious intromitter is an executor de son tort.

INTRU'SION, the Scotch law-term for a trespass on lands.

INTUI'TION. See INSTINCT, and COMMON SENSE, I'NTUS-SUSCE'PTION, or INVAGINA'TION. is the term applied to that partial displacement of the bowel in which one portion of it passes into the portion immediately adjacent to it, just as one part

adjacent part in the act of withdrawing the hand. In this case, the contained portion of intestine is liable to be nipped and strangulated by the portion which contains it, and all the danger of Hernia (q. v.) results, with far less chance of successful interference on the part of the surgeon or physician. It is one of the most frequent and fatal causes of obstruction of the bowels. The extent of the intus-susception may vary from a few lines to a foot or more. Even when inflammation is set up, the or more. Even when inhanmation is set up, the affection, although in the highest degree perilous, is not of necessity fatal. The invaginated portion mortifies and sloughs, while adhesion is established between the peritoneal surfaces of the upper and lower portions at their place of junction, so that the continuity of the tube is preserved, although a large port on may be destroyed. If the patient is strong enough to bear the shock of the inflammation, gangrene, sloughing, &c., a complete recovery ensues.

I'NULIN. See Elecampane.

I'NUUS, or INNUUS, a genus of apes, to which the Barbary Ape (q. v.) belongs. The Barbary Ape is I. sylvanus.

INVALIDFS, wounded veterans of the French army, maintained at the expense of the state. The Hotel des Invalides is an establishment in Paris where a number of these old soldiers are quartered.

Hôtel des Invalides.

By | and is an object of much attraction to all visitors. It was founded by Louis XIV, in 1671, and during his reign, and for a long time afterwards, was a place of retirement for the aged servants of court favourites as well as for invalided soldiers; but this abuse was put an end to by St Germain in Louis XV.'s reign. In 1789, the Hôtel had a revenue of ±68,000, but during the time of the Republic its property was alienated, and the institution sup-ported from the public revenue. The Hôtel can accommodate 5000 men, and the actual number of inmates is not much below this.

INVALI'DING signifies the return home, to a more healthy climate, of soldiers or sailors whom wounds or the severity of foreign service of the finger of a glove is sometimes pulled into an has rendered incapable of active duty. The man invalided returns to his duty as soon as his

INVARIABLE PLANE. The position of a point in space is determined—as explained in the article Co-ORDINATES-by referring it to planes intersecting one another at right angles; and in ascertaining the motion of the point by this means, the planes must either be immovable, or allowance mu t be made for their altered position, an operation of considerable complexity. In astronomy, none of the obviously marked planes, such as that of the Ecliptic (q. v.) or of the Equator (q. v.), possess this requisite quality of fixity so as to form a convenient basis for determining the position of heavenly bothes with absolute exactness. Laplace, therefore, conferred a boon on astronomy, when he discovered that, in the solar system, there does exist 'an invariable plane, about which the orbits perpetually oscillate, deviating from it only to a very small extent on either side. This plane passes through the centre of gravity of the solar system, and it is so situated, that if all the planets be projected on it, and if the mass of each planet be multiplied into the area, corresponding to any given time, which is described by the projected radius vector, the sum of such products will be a maximum. By means of this property, which is independent of any particular epoch, it will be easy for astronomers in future ages to determine the exact position of the plane, and to compare observations together by means of it. (Grant's History of Physical Astronomy.) Such a plane is not peculiar to the solar system, but must exist in all systems where the bodies are acted on by no other force than their mutual attraction. See

INVECTA ET ILLATA, a phrase used in Scotch law to denote all things which a tenant has brought upon the premises, as his household furniture, tools, utensils, &c.; also, in case of thirlage, all corn brought within the limits of the thirl or

INVECTED, or INVECKED. See ENGRALLED. INVENTION. See PATENT.

INVENTORY, a list or schedule of goods or property setting torth the particulars, so as to inform parties interested. The term is used in England in reference to an executor or administrator making out a list of the deceased person's effects. In Scotland, it is also used in reference to the property of an infant, pupil, or minor, whose estate is under the care of a guardian, tutor, curator, judicial factor. In Scotland, it is also used in connection with the various pleadings and deeds and documents produced or used in a suit or action, then called an inventory of process. So as to an inventory of titles, that is, the titles of an estate shewn to a purchaser.

INVERA'RAY, a small royal and parliamentary burgh and scaport of Scotland, the county town of Argyleshire, is picturesquely situated on the west shore of Loch Fync, where the river Aray falls into the loch, 45 miles north-west of Glasgow. It consists of one principal street running parallel to the loch, and a square with a church in the centre. An obelisk, starding near the church, commemorates the death of 17 gentlemen, all Campbells, who were executed here without trial in 1685, for their adherence to Presbyterianism. Close to the town stands Inveraray Castle, the chief residence of the Dukes of Argyle, 1., the ancient town, the capital of the West Highlands, was situated at some distance to the morth of the present town. Not a vestige of it now remains. The trade of Li s cheby in herring of Scotland, includes Badenoch, Glenroy, and the fishing. Pop. (1861) 1075.

INVERCARGILL, the second in population, as Dunedin is the first, among the settlements of the province of Otago, in New Zealand, stands on the south-east coast of the Middle Island. In 1860, it received 117 immigrants, all from the Australian colonies; imported to the value of £36,679, exported to the amount of £1345, and paid of customsduties, £3061, 16s. 5d. The corresponding returns for 1859 had shewn 365 immigrants, £25,026 of imports, £2142 of exports, and £1903, 8s. 9d. of customs-duties.

INVERNE'SS, a royal, parliamentary, and municipal burgh, situated at the mouth, and mostly on the right bank, of the river Ness. It is the chief town of the county to which it gives name, and may be regarded as the capital of the Highlands. Its environs, well cultivated and beautifully wooded, are almost surrounded by mountains and hills of various heights, forming altogether a most picturesque and interesting landscape. Pop. (1861) 12,509; annual value of real property, £33,166; corporation revenue, £2100 a year. It unites with Fortrose, Naira, and Forres, in returning one with Fortrose, Narm, and Forres, in returning one member to parliament. The first charters of L as a burgh are granted by King William the Lion (1165-1214 a.d.). By one of these, it is stipulated that when the king has made a ditch round the burgh, the burgesses shall make a palisade on the edge of the ditch, and keep it in good repair for ever. In 1411, the town was burned by Donald, Lord of the Isles, on his way to Harlaw (q. v.). Macaulay, writing of the year 1689, describes 1, as 'a Saxon colony among the Celts, a hive of traders and artisans in the midst of a population of loungers and plunderers, a solitary outpost of civilisation in a region of barbarians.' The Castlehill, on the south side of the town, part of an old sca-terrace, was the site of a castle, which, in 1303, was taken by the adherents of King Edward I of England, but subsequently retaken by those of King Robert Bruce. King James I. is said to have held a parliament in the castle in 1427. An iron suspension-bridge, constructed in 1855, connects the two parts of the town. In the High Street stand the town-cross, and beside it the famous Clach-na-cuddin, a lozenge-shaped blue siab, formerly regarded as the palladium of the burgh. In the same street, are the Town-hall and Exchange, built in 1708. Of the old religious foundations of 1., there is little more than mere tradition. The Dominicans seem to have had a monastery, founded by King Alexander 11., in 1233. The Franciscaus also are believed to have had a convent in the town. Among more modern buildings and foundations, may be enumerated Raining's School, established 1747; the spire of the old jail, 150 feet high, built in 1791, curiously twisted by the earthquake of 1816, and since readjusted; the Royal Academy, 1792; the County Buildings and jail, on the site of the castle, 1835; the United Charities' Institution, on the height immediately adjoining, surmounted by a tower and dome litted up as an observatory. There are an incorporation of six erafts, a small woollen matufactory, a Mechanics' Institute and library, several printing establishments, two newspapers, a native hank (the Caledonian), and five other banking-offices. I. has still its four great annual fairs, but the establishment of shops throughout the county has greatly diminished their importance. It has three harbours, built at different times, and a considerable amount of shipping by the Moray Firth and the Caledonian

valley of the Spey on the east; Lochaber on the

south; Glenclg, Glen Garry, Arisaig, Moydart, and Frasers' county on the west; Glen Urquhart and Frasers county on the west, usen triquiart and Glen Morriston towards the centre. It includes also Strathglass on the north; and several of the western islands, viz., Skye, Harris, North and South Uist, and Barra, &c. The maintand portion like between N, lat. 56° 40′ and 57° 36′, and W. long, 20° 30′ and 20° 56′; and is bounded on the long, 3-30 and 5-55; and is connect on the E. by the counties of Aberdeen, Banff, Elgin, and Naira; on the S. by Perth and Argyleshire; on the W. by the Atlantic and Ross-shire; and on the N. by Ross-shire. It measures from porth-east to south-west S5 miles, and from north-west to south-east 57 miles; and has an area of 4256 square miles, of which more than two-thirds consist of miles, or which more than two-turids consist of barren heath. The wildest and most mountainous portion is towards the west, comprising a tract 70 miles in extent, and designated the Rough Bounds. The most extensive moss in Great Britain lies on the south of Badenoch, where, in the naturally formed wooded islands, large herds of deer find a refuge. These mosses had at one time been mostly, if not wholly, covered with trees, some of them of great magnitude. In Strathspey, three tiers of stocks, one above another, have been found, shewing that a succession of forest trees must have grown up, flourished for ages, and then, one after another, disappeared by the work of time or the axe. At present, the natural pines occupy a larger space than in any other county of Britain. There are also many thousand acres of plantations of ordinary forest trees. Some mountains attain of ordinary forest trees. Some mountains attain considerable altitude. Ben Nevis, now ascertained to be the highest in Great Britain, is 4406 feet above the level of the sea. Cairngorm, partly in this county, is 4050 feet high. The geological for-mation of the county is various; but primary rocks consisting of gneiss, mica-slate, granite, porphyry, and trap rocks, mostly prevail. The most fertile soil of the county rests on the red sandstone in the valley of the Aird, and between the county town and Beauly. There are several lakes of some extent, as Loch Ness, Loch Lochy, Loch Laggan, Loch following shews how these arise:

Ericht, and a number of other locks forming arms Ericht, and a number of other locks forming arms of the sea. The principal rivers are the Ness, Spey, Locky, Beauly, Findhorn, Nairn, Garry, Morriston, and the Foyers (q. v.). The country is divided among 80 or 90 proprietors, a few of whom possess above 100,000 acres of surface. The old valued rent was 46009; the valuation for 1862—1863 was 4500 cost. The assessment of the Land for all 224,288. The assessment on the land for all county purposes amounts to £5500. According to the last agricultural statistics, taken by the Highland and Agricultural Society, for crop and year 1857, the total acreage under a rotation of crops was 42,920, of which there were 1980 acres of wheat 2341 acres of barley, and 13,749 acres of oats, averaging respectively 24, 29, and 282 bushels per averaging respectively 24, 29, and 25, business per acre. Of green crops there were 5842 acres of turnins, and 3070 of potatoes, averaging respectively 12 toos 1\(\frac{2}{3}\) evt. and 2 toos 7\(\frac{1}{2}\) evt. per acre. Of live-stock, there were 3741 horses, 23,209 cattle, 452,795 sheep, and 1706 swine. There are comparatively few antiquities worth noting in the county. These consist principally of remains of vitrified forts and ruins of old castles. The battle which decided the fate of the Stuarts was fought 16th April 1746, on Culloden Moor, a few miles from Inverness.

The Gaelic language is still generally, but in scarcely any district exclusively, spoken. Pop. 88,888. The constituency, which numbers 955,

returns one member to parliament.

INVERSION, in Music, is the transposing of one of the two notes of an interval by an octave upwards or downwards, to a position the reverse of that which it before occupied with respect to the other note, so that if the transposed note was the lower note of the two, it shall now be the higher one, and vice versa. The new interval thus formed takes its name from the complement of the octave; for example, a unison inverted becomes an octave, a second becomes a seventh, a third becomes a sixth, a fourth becomes a fifth, a fifth becomes a fourth, a sixth becomes a third, a seventh becomes a second, and an octave becomes a unison. The

and augmented become diminished; major become minor, and minor become major; but perfect inter-vals are also perfect when inverted. For inversion of chords, see Chord. An important use is also made of the word inversion, in reference to a whole passage or phrase, for which see Double Counter-POINT.

INVE'RTEBRATE ANIMALS (Invertebrata) are those animals which have not a vertebral column or spine. The division of animals into Vertebrate and Invertebrate is a natural and unavoidable one, acknowledged in all systems of zoology. But these groups being formed, the one on a positive, and the other on a negative character, are by no means of equal value in the classification of the animal kingdom. In Cuvier's system, the invertebrate animals dom. In turier system, the invertebrate animals form three of the great divisions of the animal kingdom—viz., Mollucca, Articulata, and Radiata, each of which, like Verberata, exhibits a peculiar type of structure. There are also animals of lower organisation than those which can with certainty be referred to these divisions, although included by Cuvier amongst the Radiata, forming the Acrita and Protozoa of recent systems. Amongst the lower

By inversion diminished intervals become augmented, | vertebrate animals, the arrangement into groups must be regarded as at present, in a great measure, tentative and provisional; although in the higher departments of invertebrate zoology many of the classes and other groups are very well defined. The organisation of some of them, as Insects, however different from that of vertebrate animals, is not evidently lower, but exhibits a perfection as admirable as in any of them, whilst all vital powers are most fully displayed.

INVESTITURE (Lat, in, and vestio, to elethe), in feudal and ecclesiastical history, means the act of giving corporal possession of a manor, office, or benefice, accompanied by a certain ceremonial, such as the delivery of a branch, a banner, or an instrument of office, more or less designed to signify the power or authority which it is supposed to convey. The contest about ecclesiastical investitures is so interwoven with the whole course of medieval history, that a brief account of its origin and nature is indispensable to a right understanding of many of the most important events of that period. The system of feudal tenure had become so universal that it affected even the land held by ecclesiastical and attached to most of the higher ecclesiastical invertebrate animals, much more than amongst dignities, monastic as well as secular. Accordingly,

which they held, came into possession of the lands attached to such offices, began to be regarded as becoming by the very fact feudatory to the suzerain of these lands; and, as a not unnatural result, the suzerains thought themselves entitled to claim, in reference to these personages, the same rights which they enjoyed over the other feudatories of which they eligible to be constructed to their domains. Among these rights was that of granting solemn investiture. Now, in the case of bishops, abbots, and other church dignitaries, the form of investiture consisted in the delivery of a pastoral staff or crosier, and the placing a ring upon the finger; and as these badges of office were emblematic - the one of the spiritual care of souls, the other of the espousals, as it were, between the pastor and his church or monastery - the assumption of this right by the lay suzerains became a subject of constant and angry complaint on the part of the church. On the part of the suzerains it was replied, that they did not claim to grant by this rite the spiritual powers of the office, their function being solely to grant possession of its temporalities, and of the temporal rank thereto annexed. But the churchparty urged, that the ceremonial in itself involved the granting of spiritual powers; insomuch that in order to prevent the clergy from electing to a see when vacant, it was the practice of the emperors to take possession of the crosier and ring, until it should be their own pleasure to grant investiture to their favourites. The disfavour in which the practice had long been held found its most energetic expression in the person of Gregory VII., who having, in the year 1074, enacted most stringent measures for the repression of simony, proceeded, in 1075, to condemn, under excommuproceeded, in 17.5, to condemn, under excommin-incation, the practice of investiture, as almost necessarily connected with simony, or leading to it. This prohibition, however, as is observed by Mosheim (ii. 326), only regarded investiture in the objectionable form in which it was then practised, or investiture of whatever form, when the office had been obtained simoniacally. But a pope of the same century, Urban II., went further, and (1093) absolutely and entirely forbade, not alone lay investiture, but the taking of an oath of fealty to a lay suzerain by an ecclesiastic, even though holding under him by the ordinary feudal tenure. The contest continued during the most of the 11th century. In the beginning of the 12th c., it assumed a new form, the pope, Pascal II., having actually agreed to surrender all the possessions and royalties with which the church had been endowed, and which alone formed the pretext of the claim to investiture on the part of the emperor, on condition of the emperor (Henry V.) giving up that claim to investiture. This treaty, however, never had any practical effect; nor was the contest finally adjusted until the celebrated concordat of Worms in 1122, in which the emperor agreed to give up the form of investiture with the ring and pastoral staff, to grant to the clergy the right of free elections, and to restore all the possessions of the church of Rome which had been seized either by himself or by his father; while the pope, on his part, consented that the elections should be held in the presence of the emperor or his official, but with a right of appeal to the provincial synod; that investitare might be given by the emperor, but only by the touch of the sceptre; and that the bishops and other church dignitaries should faithfully discharge all the fendal duties which belonged to their principality.

Such was the compact entered into between the contending parties, and for a time it had considerable effect in restraining one class of abuses;

ecclesiastics who, in virtue of the ecclesiastical office the real evil of simony and corrupt promotion of unworthy candidates for church dignities. Still the principle upon which the opposition to investiture was founded was almost a necessary part of the medieval system, and Mosheim (ii. 327) regards it as 'perfectly accordant with the religious principles of the age. It was, in fact, but one of the many forms in which the spirit of churchmauship has arrayed itself, whether in ancient or modern times. against what are called the Erastian tendencies which never fail to develop themselves under the shadow of a state church, no matter what may be its creed or its constitution.

> INVESTITURE, the term used in Scotch law to denote the giving feudal possession of heritable property. It was formerly given to the vassal in presence of the pares cariæ, but latterly has been superseded by infeftment or sasine, and now it is effected by mere registration of the deed of convevance.

INVOCATION OF ANGELS AND SAINTS.

the act of addressing prayers to the blessed spirits who are with God, whether the angels or the souls of the just who have been admitted to the happiness of heaven. The practice of addressing prayers to angels, especially to the angel-guardian, to the Virgin Mary, and to other saints, prevails in the Roman, the Greek, the Russo-Greek, and the castern churches of all the various rites. In the Christian religion, the principle of the unity of God excludes all idea of subordinate sharers of the divine nature, such as is to be found in paganism, and all alike, Roman Catholics as well as Protestants, agree that its very first principles exclude the idea of rendering divine worship, no matter how it may be modified, to any other than the One Infinite Being. But while Protestants carry this principle so far as to exclude every species of religious worship and every form of invocation addressed to angels or saints, as trenching upon God's honour, and irreconcilable with the Scriptures, which hold Him forth as the sole object of worship and the only fountain of mercy, the Roman Catholic religion permits and sanctions a worship (called douleia) of the saints, inferior to the supreme worship (latreia) offered to God, and an invocation of the saints, not for the purpose of obtaining mercy or grace from themselves directly. but in order to ask their prayers or intercession with God on our behalf. For this doctrine and the analogous practice, they do not advance the direct authority of Scripture (except a few passages which authority of Scripture (except a tot passage of the seem to them to imply the intercommunion of the two worlds, as Matt. xiii. 3, Luke xiv. 17, Exod. xxxii. 13), but rely ou what to them is equally decisive testimony, viz., the unwritten word of God conveyed by tradition. Origen (Opp. ii. p. 273) speaks of the belief that 'the saints assist as by their prayers' as a doctrine which is 'doubted by no one.' St Cyprian, addressing the confessors going to martyrdom, engages by anticipation their prayers in his behalf when they shall have received their heavenly crown (Ep. 60, Dodwell's edition). To the same effect are cited the testimonies of Basil (Opp. ii. 155), Gregory Nazianzen (Opp. i. 288), Gregory of Nyssa (ii. 1017), Ambrose (ii. 200), Chrysostom (iv. 449), and many other Fathers, as well as the liturgies of the various ancient churches, whether of the Roman, the Greek, the Syrian, or the Egyptian

On the other hand, Protestant historians, even admitting the full force of these testimonies to the existence of the practice, allege that the practice is an early, but unscriptural addition, dating only from the infusion into the church system of Alexbut it went only a little way towards eradicating andrian Neo-platonism and Oriental Magianism,

which they believe to have left traces even in the so-called orthodox Christianity of the fourth and fifth centuries. But leaving aside the doctrinal controversy, the fact at least is certain, that in the fourth, and still more in the fifth and following centuries, the usage was universal; and a curious evidence of its prevalence is furnished by the fact, that the very excess to which it was carried was condemned as a heresy (that of the Collyridians) by those who themselves confessed the lawfulness of the practice when confined within its legiti-mate limits. That similar excesses in the practice, and similar abuses as to the nature and limits of the legitimate invocation of the saints continued through the medieval period, Roman Catholics themselves admit, although they allege that such abuses were at all times reprobated by the authentic teaching of the church; and the multiplied devotions to the saints, especially to the Blessed Virgin. the efficacy claimed for them, and the extraordinary legends connected with them, and the prominence which the worship had assumed in the church, were among the most fertile themes of invective with the first Reformers. The Council of Trent (25th Sess., On the Invocation of Saints) defines very precisely what is the doctrine of the Catholic Church on this subject. It declares 'that the saints who reign with God offer up their prayers to God for men; that it is good and useful suppliantly to invoke them, and to resort to their prayers, aid, and help, for the purpose of obtaining benefits of God through his son Jesus Christ our Lord, who alone is our Redeemer and Saviour.' From this decree it is inferred that the Catholic doctrine on the saints does not prescribe the practice of invoking them as necessary or essential, but only as 'good and useful,' and that what is to be asked of them is not the direct bestowal of grace and mercy, as from themselves, but only their prayers, their assistance, and their help in obtaining benefits from God; and although many forms of prayer which are in use among Catholics bear, especially to a Protestant reader, all the appearance of direct appeals to the saints themselves for the benefits which are implored, yet all Catholic authorities are unanimous in declaring that these forms of words are to be interpreted, and that, from habitual use, they are so interpreted, even by the most superficially instructed Catholics, with the understood explanation, that all the power of the saints to assist us consists exclusively in their prayers for us, and seconding our prayers by their own. See Bellarmine, Controversice de Sanctorum Beatitudine, lib. i. cap. xvii.

Protestants object to the invocation of saints and of angels, that it is without evidence of divinc authority, contrary to the whole tenor of Scripture, and derogatory to the mediatorship of Christ. ask what reason can be adduced for believing that prayers addressed to saints are even heard by them, or that they have always a knowledge of the wor-ship addressed to them? They further deny that the prayers addressed to saints—and particularly to the Virgin Mary—are always capable of explanation as merely an asking of their prayers on behalf of those who invoke them, and quote many instances in proof.

I'NVOICE, a list or account of merchandise or goods sold, either sent along with the goods themselves or separately.

INVOLU'CRE (Lat. a wrapper or envelope), in Botany, is a group of bracts surrounding flowers in their unexpanded state, and occupying a place on the floral axis beneath them after their expansion. The bracts which form an involucre are generally is very commonly an involucre, not only to the umbel, but to each division of the umbel, or umbel-lule. The former is called the general involucre, or simply the involucre: the latter are partial involucres. or involucels. The cup of the acorn, hazel, chesnut. &c., may be regarded as an involucre.

I'NVOLUTE. See EVOLUTE.

INVOLUTION AND EVOLUTION are two eperations the converse of each other. The object of the first is to raise a number to any power, which is effected by continuously multiplying the number by itself till the number of factors is number by itself till the number of ractors is equal to the number designating the power, thus, 2 raised to the third power is $2 \cdot 2 \cdot 2 \cdot 2$, or 8; 7 raised to the fourth power is $2 \cdot 7 \cdot 7 \cdot 2\pi$, or 2401, &c. Evolution, on the other hand, is the extraction of a root of any number, that is, it is a method for discovering what number, when raised the contraction of t to a certain power, will give a certain known number-e.g., the square root of 64 is 8, that is, 8 is the number which, raised to the second power, will give 64; 3 is the fourth root of 81, that is, 3 raised to the fourth power is 81, and so on. The symbols expressive of the two operations are as follow: 53 means that 5 is to be raised to the third power; (72)5 means that the square or second power of 7 is to be raised to the fifth power; \square 9 or 3/9 or 92 signifies that the extraction of the second or square root of 9 is required; \$\square 256 or 256\$, that the fourth root of 256 is to be extracted; and so Involution and evolution, like multiplication. and division, or differentiation and integration, differ

in the extent of their application; the former, or direct operation, can always be completed, while there are numberless cases in which the latter fails to express the result with perfect accuracy.

'ODINE (symb. I, equiv. 127) is one of a group of four non-metallic elements to which the term Halogens (q. v.) has been applied. It derives its name from Gr. iōdēs, violet-like, in consequence of its magnificent purple colour when in a state of vapour. At ordinary temperatures, it usually occurs in solid dark-gray glistening scales; it is, however, crystallisable, and sometimes appears as an octahedron with a rhombic base. It is soft, and admits readily of trituration, has the high specific gravity of 4 95, and evolves a peculiar and disagreeable odour, which indicates its great volatility. It fases at 225°, and at about 350° it boils, and is converted into the purple vapour to which it owes its name; it has an acrid taste, and communicates a brownish-vellow colour to the skin. It is very slightly soluble in water, but dissolves readily in watery solutions of iodide of potassium and of hydriodic acid, and in alcohol and ether. Iodine vapour is the heaviest of all known vapours, its specific gravity being 8716. It combines directly with phosphorus, sulphur, and the metals. Its behaviour with hydrogen is analogous to that of chlorine and bromine (see Hydrochloric Acid), but its affinities are weaker than those of the last-named el ments. It likewise combines with numerous organic substances, and the compound which it forms with starch is of such an intense blue colour, that h solution of starch forms the best test for the presence of free iodine. By means of this test, one part of iodine may be detected when dissolved in one million parts of water.

The following are some of the most important iodine compounds. With hydrogen, it forms only one compound, hydriodic arid (III), a colourless pungent acid gas, which, in most respects, is analogous with hydrochloric acid. It is obtained grouped in a whorl. In nmbelliferous flowers, there by the action of water on teriodide of phosphorus

The soluble jodides of the metals may be obtained by the direct combination of hydriodic acid with the metallic oxides, the resulting compounds being the metallic iodide and water. Some of these iodides are of extreme brilliancy, and others are of great value in medicine; amongst the latter must be

iron, and the indides of mercury. the most important medicine in the pharmacopreia. It crystallises in colourless cubes, which are sometimes clear, but usually have an opaque whitish appearance, and are soluble in water and spirit. It bromine, funning nitrie acid, and ozone (q. v.). There are arious ways of obtaining this salt; the following i one of the best. If iodine be added to a warm sol_tion of potash until a brown tint begins to appear, iodide of potassium (K1) and iodate of potash (K1O3) are formed. By gentle ignition of the residue obtained by evaporation, the indate is decomposed into i-dide of potassium and oxygen, sn filings in a closed vessel with four times the weight of rodine suspended in water. Direct combination takes place, and a pale-green solution is formed, which by evaporation in varuo yields crystals. It is the solution which is most commonly employed in medicine, but as, on exposure to the air, it becomes decomposed, and iodine is liberated, it is usually mixed with strong syrup, which retards this

The three iodides of mercury are the mercurous (Hg21), the mercuroso-mercuric (Hg21s), and the mercurie (HgI). They may be formed either by the direct union of the two elements, or by the double decomposition of iodide of potassium and mercurial salts. There are two well-defined compounds of iodine and oxygen, viz., iodic acid (IIIO3) and periodic acid (HIO4), corresponding to chloric and perchloric acid,

neither of which is of any special interest.

tion with sodium, magnesium, or calcium, is very widely diffused over the earth's surface. It exists in sea-water, in marine animals and plants, and in certain nuneral springs. It is also found in several minerals, as, for example, in certain Mexican silver ores, in Silesian zinc ores, in phosphorite from the

Upper Palatinate, and in coal. Iodine was discovered in 1811, by Courtois, in the waste liquors produced in the manufacture of earbonate of soda from the ashes of sea-weeds. A a simple clientary body. It is obtained from the half-fused ash of dried sca-weeds, which is known in this country as Kelp (q. v.), and in Normandy as Varek, and contains the iodides of sodium, potassum, magnesium, and perhaps calcium in con-siderable quantity. The iodine is liberated by the addition of binoxide of manganese and sulphuric acid. Most of our commercial iodine is prepared

The preparations of iodine are employed extensively in medicine and in Photography (q. v.). Iodi le of potassium, and the preparations of iodine generally, are almost entitled to be regarded as specifies in cases of goltre, bronchoecle, or Derbyshire neck. Out of 364 cases (collected by Bayle) which were treated with iodine, 274 were cured. Manson, Lugol, and others have shown the value of the iodine-treatment in scrofula. The preparachronic rheumatism, and in certain affections of the asseous system, due to a syphilitic taint, iodide of potassium is of the greatest service; and its value in the treatment of chronic lead-poisoning is not so generally known, even in the medical profession, as it deserves to be. The iodide of potassium dissolves the compounds of lead with albumen, fibrine, &c., which abound in the body in chronic lead-poisoning; and these dissolved compounds are exercted by the kidneys. In these cases, lead may often be detected in the urine, almost immediately after the administration of the iodide. This salt has a similar action in chronic mercurial poisoning, and cases are recorded of mercurial salivation having come on during the use of iodide of potassium, in conse-quence of the liberation of mercury, which had been previously fixed in the system.

Iodide of iron, which may be given either in symp or in the form of Blancard's Pills (an excellent serviceable in scrofulous affections of the glandular system, in which the use both of iodine and of iron is indicated. The iodides of mercury have been prescribed with good effect in various forms of syphilis, They must be given with caution, on account of their energy, the average dose of the red iodide being a fraction (1 to) of a grain. Pure iodine is seldom prescribed internally; but in the form of tincture and cintment, it is a most useful topical application in cases of goitre, local enlargements, diseases of joints, chilblains, &c.

In large doses, iodine and most of the iodides act as irritant poisons; but very few fatal cases are on record. In the event of poisoning with the tineture of iodine, the first point is to evacuate the stomach; and the vomiting is assisted by the copious use of tend liquids, containing starchy matter, as, for instance, starch, flour, or arrow-root builed in water; the object being to form iodale of

10'NA, the modern name of the most famous of the Hebrides, is believed to have originated in a mistaken beading of n for u; the word, in the oldest manuscripts, being clearly written Iona. From the 6th c. to the 17th c., the island was most generally called I, Ii, Ia, Io, Eo, III, III, III, III., Y., or Fi that is, simply, 'the Island;' or Icolmkill, I-Columb-Kille, or II-i-Colum-Kille—that is, 'the Island of Columba of the Church.

It is about three miles long, and varies in breadth from a mile to a mile and a half. In 1861, it had a population of 264. Its area, computed by Bede at 'five families' (or 'five hides of land,' as the passage is rendered in the Anglo-Saxon Chronicle), is estimated at 2000 imperial acres, of which rather more than a fourth part is under tellage. The soil is naturally fruitful, and yields earlier crops than most parts of Great Britain, barley sown before the middle of June being ready for the sickle in August. This remarkable fertility was regarded as miraculous in the dark ages, and, no doubt, led to the early occupation of Iona. Dunii, the highest point of the island, is 330 feet above the

Its history begins in the year 563, when St Columba (q, v,), leaving the shores of Ireland, landed upon I, with twelve disciples. Having obtained a grant of the island, as well from his kinsman Conall, the son of Comghall, king of the Scots, as from Bruidi, the son of Melchon, king of the Picts, he built upon it a monastery, which was long regarded as the mother-church of the Piets, and was venerated not only among the Scots of Britain and Ireland, but among the Angles of the north of England, who resolvents in chronic induration, and enlargement of the liver, spleen, nterus, &c. In many forms of aries of Iona. From the end of the 6th to the

end of the 8th c., I. was scarcely second to any monastery in the British Isles; and it was this brilliant era of its annals which rose in Johnson's mind when he described it as 'that illustrious island which was once the luminary of the C.ledonian regions, whence savage clans and roving barbarians derived the benefits of knowledge and the blessings of religion.' But neither piety nor the blessings of religion. But nettner piety nor learning availed to save it from the ravages of the fierce and heathen Norsemen. They burned it in 795, and again in 802. Its 'family' (as the monks were ealled) of 68 persons were martyred in 806. A second martyrdom, in 825, is the subject of a contemporary Latin poem by Walafridus Strabus, abhot of the German monastery of Reichenan, in the Lake of Constance. On the Christmas evening of 986, the island was again wasted by the Norsemen, who slew the abbot and 15 of his monks Towards the end of the next century, the monastery was repaired by St Margaret, the queen of King Malcolm Canmore. It was visited in 1097 by King Magnus the Barefooted, of Norway. It was now part of that kingdom, and so fell under the ecclesiastical jurisdiction of the Bishop of Man and the Archbishop of Drontheim. In 1203 the hishops of the north of Ireland disputed the authority of the Manx bishop, pulled down a monastery which he had begun to build in the island, and placed the abbey under the rule of an Irish abbot of Derry. The Scottish Church had long claimed jurisdiction in I., and before the end of the 13th c., the island fell under the rule of the Scottish king. Its fell under the rule of the Scottish king. Its abbey was now peopled by Clugniac monks; and a numery of Austin canonesses was planted on its shores. Towards the end of the 15th e., it became the seat of the Scottish Bishop of the Isles, the abbey church being his cathedral, and the monks his chapter.

No building now remains on the island which can claim to have sheltered St Columba or his disciples. The most ancient rains are the Laithrichean, or Foundations, in a little bay to the west of Port-a-Churraich; the Cobhan Cuildich, or Culdees' Cell, in a hollow between Dunii and Dunbhairg; the rath or hill-fort of Dunbhuirg; and the Gleann-an-Teampull, or Glen of the Church, in the middle of the island, believed to be the site of the monastery which the Irish bishops destroyed in 1203. St Orau's Chapel, now the oldest church in the island, may probably be of the latter part of the 11th century. St Mary's Nunnery is perhaps a century later. The Cathedral, or St Mary's Church, seems to have been built chiefly in the early part of the 13th century. It has a choir, with a sacristy on the north side, and chapels on the south side; north and south transepts; a central tower, about 75 feet high; and a nave. An inscription on one of the columns of the choir appears to denote that it was the work of an Irish ecclesiastic who died in 1202. On the north of the cathedral are the chapter-house and other remains of the conventual or monastic buildings. In the 'Reilig Oran'—so called, it is supposed, from St Oran, a kinsman of St Columba, the first who found a grave in it—were huried Ecgfrid, king of Northumbria, in 684; Godred, king of the Islcs, in 1188; and Haco Ospac, king of the Isles, in 1228. No monuments of these princes now remain. The oldest of the many tombstones on the island are two with Irish inscriptions, one of them, it is believed, being the monument of a bishop of Connor who died at I. in 1174.

After centuries of neglect, this interesting island seems now to be in the way of improvement. It possesses a church connected with the Establish-

course of erection by the Duke of Argyle, proprietor of I. : by which means tonrists and antiquarian of I; by which means torrists and antiquarian explorers will be enabled to make visits of satis-factory duration. During summer, steamers from Oban (see Hebrides) call at I. twice a week; they land passengers by boats at Baile Mor, the only village on the island, and usually stay an hour, to allow time for visiting the ruins.

IO'NIA, the ancient name of the most flourishing country of Asia Minor. It received its name from the louians (one of the four most ancient tribes in Greece), who, again, according to the mytho-logical account, derived theirs from Ion, the son of Apollo by Creusa, a daughter of a king of Athens. According to the usually received tradition. they were driven out of the Peloponnesus by the Achaians, and removed to Attica, whence, about 1050 B. C., bands of them went forth to settle on the eoast of Asia. I. was a beautiful and fertile country, extending, according to Ptolemy, from the river Hermus to the river Meander, along the coast of the Ægean Sea, but Herodotus and Strabo make it somewhat larger. It soon reached a high point of prosperity; agriculture and commerce flourished, and great cities arose, of which Ephesus, Smyrna, and great chaes arose, or which Ephesus, Smyria, Clazomenze, Erythræ, Colophon, and Miletus were the most celebrated. These free cities, which formed the nucleus of the Ionian League, were, however, gradually subdued by the kings of Lydia, and passed (557 B.C.) under the sway of the Persians, but were allowed a considerable measure of internal liberty. During the great Persian war, the contingent which they were compelled to furnish to their Oriental masters deserted to the Greeks, at the battle of Mycale (479 B.C.), whereupon the Ionians entered into an alliance with Athens, upon which they now became dependent. After the Peloponnesian war, they were subject to the Spartans, and again (387 B.C.) to the Persians till the time of Alexander the Great. From this period, I. shared the fate of the neighbouring countries, and in 64 B.C. was added to the Roman empire by Pompey, after the third Mithridatic war. In later times, it was so ravaged by the Turks that few traces of its former greatness are now left .- The Ionians were regarded as somewhat effeminate. They were wealthy and luxurious, and the tine arts (see Ionio ARCHITECTURE) were cultivated amongst them at a much earlier date than amongst their kinsuen in the mother-country. The Ionic Dialect excels the other Greek dialects in softness and smoothness, chiefly from the greater number of vowels introduced.

IO'NIAN ISLANDS, a group, or rather chain, running round the west coast of Epirus, and west and south of Greece. It consists of about 40 islands, of which Corfu, Paxo, Santa Maura, Theaki. Cephalonia, Zante, and Cerigo, are of considerable size; the total area is about 1041 square miles, and the population (1865), 231,712, is mostly of Greek descent. The proportion of females to males is as 100 to 116. The collective term 'Ionian' is of modern date. After the division of the Roman Empire, these islands were included in the eastern half, and so continued till 1081, when the Duke of Calabria (subsequently king of Naples) took possession of them. From this time they underwent a eontinual change of masters, till the commencement of the 15th c., when they by degrees came into the possession of the Venetians, who in 1797 ceded After centuries of neglect, this interesting island them to France. They were seized by Russia and possesses a church connected with the Establish. 1899, and Nov. 5, 1815, were formed into a republic ment, also a Free Church, and a school. At present ("The United States of the Ionian Islands") under the (March 1860), a small and commoditions in is in protectorate of the latter. The following is a sketch

of their condition in 1863. The government was earried on by two assemblies, and the Lord High Com-missioner, who represented Her Maiesty. The lower assembly consisted of 40 members, who were required to be pobles: 29 of them were elected by the islanders themselves, and 11 by the Lord High Commissioner: their term of office was tive years, during which period three sessions were held, of three months each, The senate, composed of five members, which the commissioner had power to increase to seven, formed the executive. The commissioner was invested with extensive powers: he could convoke an extraordinary meeting of parliament, confirm or reject the resolutions of the senate, and veto all bills passed by the legislature. He had the nomination of most of the public functionaries, and had supreme jurisdiction in all matters of finance, police, and public safety. Up to 1848, the press was restricted, and the government was really a despotism : but after that time the lonians obtained liberty of the press, lowering of the fran-chise, perfect freedom of election, both parliamentary and municipal, and vote by bullot. Justice is administered by a royal court; there are tribunals of the first instance in Corta, Zante, and Santa Maura. The protecting force formerly consisted of a British garrison, but a Greek carrison is now stationed at Corfu In 1860, the islands produced 69,553 harrels of oliveoil, 30,250,897 lbs, of currants, and 148,539 barrels of wine, and of wheat only 67,580 bushels; the value considerably exceeding £500,000. The live-stock for the same year consisted of 13,171 horses, 10,374 enttle, 131,684 sheep, and 111,907 goats, a considerable increase on the previous years. The revenue for 1862 was £174,754, and the expenditure (which generally exceeds the income), £160,644. The chief item in the revenue is the export-duty on currents and olive-oil, In 1867, there were imported into G. Britain 1,002,366 cwts. of currants (a small grape), valued at £909,578, and in 1869, 944,489 cwts., valued at £1,166,905, Currants are the staple product of the islands, but are also grown in the Moren in the vicinity of Patras. During the protectorate the I. I. cost Britain, on an

After 1833 there arose a wide-spread dislike to Britain, and the people, impatient of her protecting, Alea, the manolel annexation to Greece. In May, 1864, the 'United States of the Ionian Islands' were formally annexed to Greece; on the 6th of June the king of Greece arrived at Corfu, and was enthusiastically received by the inhabitants. The reception of the Ionian representatives at Athens is described as a perfect national felic.

ION IAN MODE, in Music, one of the old church modes, and to be the same as the ancient Greek mode of that name, and the only one of the old church modes which agrees with our modern yelten of music, the Ionian mode being the same as our key of C major. The character of the Ionian mode, however, must have appeared to the ancients more properly defined than it can to us, as it was the only one of their modes which had a major third and a sharp sevential.

10°NIC ARCHITECTURE, a style of Greek architecture which took its origin in lonia, and seems to have derived many of its characteristic features from Assyria. See Girecta Ancurrecrurez. The chief peculiarity of Ionic architecture is the capital of the Columns (a, v.), which is decorated with spiral ornaments called Volutes (q, v.). The columns have also bases, which were not used in Durie architecture. The cornice is distinguished by the densit band, an ornament first untroduced in the band, and ornament first untroduced in the spiral ornament first untroduced in the spiral ornament first untroduced in the spiral in lonic architecture, is one of the features which indicate its eastern origin.

Many large temples were crected in this style in Asia Minor and Greece. Among the filest examples now existing are the temples of Errelitheus and Minorra Polias on the Acropolis at Athens, Apollo Dilymens at Mietus, Minorva Polias at Pricue, and Bacchus at Teos; and the temple of Fortune at Rome.

IONIC SCHOOL is the collective name given to the earliest Greek philosophers, Thules, Anaximander, Anaximenes, Herachtus, and Anaxagoras, on account of their following one general tendency, and belonging for the most part to Ionia. See the biographics of these philosophers.

I. O. U., a memorandum of debt given by a borrower to a lender, so called from being made in this abbreviated form:

LONDON, January 1, 1862.
Mr A. B., I. O. U. £20.

Mr A. B., I. O. U. £20. C. D.

It is a convenient document, because it requires no stamp, and yet it is valuable evidence of the existence of the debt, in case an action is afterwards brought. If, however, the 1. O. U. contain any promise to pay the debt, then it will amount to a promissory-note, and be void unless it have a stamp.

I'OWA, one of the United States of America, was organised as a state, with governor and legislature, in 1846. It lies between 40° 20' and 43° 30' N. lat., and 90° 12' and 96° 53' W. long., and extends 208 miles from north to south, and 300 from east to west, with an area of 55,045 square miles, or 35,228,800 acres. It is bounded on the N. by Minnesota; E. by Wisconsin and Illinois, from which it is separated by the Mississippi River; S. by Missonri; and W. by Nebraska and Dakota, from which it is separated by the Missnuri R. and Sionx R. It has 100 counties, with Des Moines for its capital. The population in 1840 was 43,112; in 1850, 192,214; in 1860, 674,948; in 1870, 1,182,933. The rivers are the Mississippi and Missouri on its eastern and western borders, and the Des Moines, Iowa, Red Cedar, and their branches. The surface is undulating and beautiful, with alternate forests and prairies. There are no mountains; but bold bluffs, with picturesque ravines, line the rivers. In the north-east, there are rich deposits of lead, and coal in the south and west, with iron, marble, clay, gypsum, &c. The soil is exceedingly fertile, and the climate healthful; the peach blossoms in the middle of April, but the winters are severe, with an average of 260 The chief productions are wheat, maize, flax, tobacco, cattle, and hogs. It has not much direct foreign commerce, but trades extensively with the Atlantic and Gulf towns, and with the interior. The chief and Gulf Iowns, and with the interior. The ener-river ports of L are Keokuk, Fort Madison, Burling-ton, Muscatine, Davenport, Clinton, Bellevue, and Dubuque. There are many manufactories, and in 1870 there were 2140 miles of railway, representing a capital of \$85,763,000. There are 28 colleges, and 6229 public schools, sustained by a permanent schoolfund of \$2,221,475.

IOWA CITY, a city in Iowa, United States of Americs, formerly the capital of the territorial government, is situated on the Iowa River, 80 miles from its mouth. It is built or a succession of plateaux, rising from the river. The first is a public promeade; the third is crowned by the capital, now the state university. It has also county buildings, and the state asylums, with factories on the falls of the river. There is steambach may be a succession to the Mississippi, and connection with the east by railway. Pop. in 1850, 2262; in 1860, 624.

HECACUA'NHA, the name both of a very action or so much nausea and depression as tartar value in the plant (Cophaelis I precausable) belongs to the L is useful as an emetic when it is necessary to natural order Cinchonaceæ, and grows in damp shady woods in Brazil and some other parts of South America. It is somewhat shrubby, with a few oblongo-lanceolate leaves near the ends of the few obtongo-tanceolate reaves near the ends of the branches, long-stalked heads of small white flowers, and soft dark purple berries. The part of I. used in medicine is the root, which is simple or divided into a few brauches, flexuous, about as thick as a goosequill, and is composed of rings of various size, somewhat fleshy when fresh, and appearing as if closely

Inecacuanha.

strung on a central woody cord. The different kinds known in commerce (Gray, Red, Brown) are all produced by the same plant; the differences arising from the age of the plant, the mode of drying, &c. I. root is prepared for the market by mere drying. It is collected at all seasons, although chiefly from January to March; the plant is never cultivated, but is sought for in the forests chiefly by Indians, some of whom devote themselves for months at a time to this occupation. It has now become scarce in the neighbourhood of towns.

Various other plants, containing emetine, are used as substitutes for true ipecacuanha. The L of Venezuela is produced by Sarcostemma glaucum, of the order Asclepiadeæ; and to this order belongs Tylophora asthmatica, the root of which is found a valuable substitute for I. in India.

It is in the bark of the root that the active principle, the emetine, almost entirely lies, and in principle, the emeans, almost entirely lies, and in good specimens it amounts to 14 or 16 per cent.; the other ingredients, such as fatty matters, starch, lignine, &c., being almost entirely inert. Emetine is represented by the formula C₂, H₂, NO₂. It is a white, inoderous, almost insipid powder, moder-stelly exhibit in the third. ately soluble in alcohol, and having all the charac-ters of the vegetable alkaloids. It acts as a violent emetic in doses of 7th of a grain or less, and is a powerful poison. The incautious inhalation of the dust or powder of L.—as in the process of powdering tt—will often bring on a kind of spasmodic asthma.

In small and repeated doses-as, for instance, of a grain or less-I. increases the activity of the a grain or ress-r. increases the scentrity of and secreting organs, especially of the bronchial mucous membrane, and of the skin. In larger doses of from 1 to 5 grains it excites nausea and depres-622

I. is useful as an emetic when it is necessary to unload the stomach in cases where there is great debility, or in childhood. As a nauscant, expectorant, and diaphoretic, it is prescribed in affections of the respiratory organs, as catarrh, hooping-cough, asthma, &c.; in affections of the alimentary canal, as indigestion, dysentery, &c.; and in disorders in which it is desired to increase the action of the skiu, as in diabetes, febrile affections, &c.

Besides the Powder, the most useful preparations are the Winc of L—of which the dose to an adult as are the Wine of L—ot which the dose to an adult as a disphoretic and expectorant ranges from 10 to 40 minims, and as an emetic from 2 to 4 drachus— and the Compound I. Powder, commonly known as Dover's Powder (q. v.). To produce the full effect as a sudorific, a dose of ten grains of Dover's Powder should be followed by copious draughts of whitewine whey, treacle-posset, or some other warm and harmless drink.

IPHIGENI'A, in Grecian legend, a daughter of Agamemnon and Clytemnestra, or, according to others, an adopted daughter of Clytennestra. others, an adopted daugner or crytennestra. The father, having offended Diana, vowed to make atonement by sacrificing to the goddess the most beautiful thing born within the year. This happened to be Iphigenia. Agamemnon long delayed the fulfilment of his vow, but at length the Trojan expedition drew on, and the Greek fleet being detained in Aulis by a calm, the scer Calchas declared that Agamemnon must keep his promise. When L was brought to the altar, however, she disappeared, and a hind lay there in her stead, Diana herself having carried her off in a cloud to Tauris, where she became her priestess, but was afterwards recognised by her brother, Orestes, who afterwards recognised by her nrother, virsues, was carried her, along with the image of Diana, to Attica. The legend is of post-Homeric origin. It has, however, been much wrought into Grecian poetry, and afforded many subjects to painters and sculptors. In modern literature, it has been again employed with great power of genius and poetic art by Goethe in his *Iphigenia auf Tauris*.

IPOMÆ'A, a genus of plants of the natural order Convolvulaceae, differing very little from the genus Convolvulus. The species are numerous. They are mostly natives of warm countries. Some of them are often to be seen in flower-gardens and hothouses, being very ornamental, and readily covering trellises with their twining stems, large leaves, and large beautiful flowers. The roots of some of them yield a resinous substance, which possesses proper-ties resembling those of jalap, and the true Jalap (q. v.) plant itself has sometimes been referred to this genus.

IPSAMBU'L. See ABOUSAMBUL. I'PSICA. See Modica.

I'PSWICH, a market-town, parliamentary and municipal berough, and river-port of England, capital of the county of Suffolk, is agreeably situated on the river Orwell, at the foot of a range of hills, 68 miles north-east of London. The older portions of the town consist of narrow and irregular streets, some of the old houses of which are ornamented with curious carved work. It contains numerous churches, and benevolent and charitable numerous churches, and benevoient and charitable institutions; a Mechanics' Institution, with ahout 700 members; and a Working Men's College, with 200 members. Of its educational establishments, the membrane, and of the skin. In larger does of principals its degramma-school, founded by Cardinal from 1 to 5 grains it excites nause and depression, while in does of from 15 to 30 grains it and in does of from 15 to 30 grains it are as as an emetic, without producing such violent as a second such as a seco

J B. LIPPINCOTT & CO. PHILAD!

founded as a memoral of the late Prince Consort, and two exhibitions at Pendrock College, Cambridge. There are large iron and soap factories, howeveries, corn-mills, and ship-building docks. In 1861, 2269 vessels, of 162,467 tons, entered and cleared the port. The exports are chiefly agricultural produce, and agricultural implements and machinery; imports, wine, coal, iron, and timber. The town can be approached by vessels of 500 tons. It sends two members to the imperial parlament. Pop. (1861) 37,349. I. was pillaged and dismantled by the Danes in 1991, and again in 1000.

HRAK-AJEMI, a large province of Persia, is bounded on the N. by the provinces of Azerbijan. Ghilan, and Mazanderan, and on the E. by Khorsan. On the S. and W., the boundaries are not definitely hid down. In the extreme north are the Elburz Mountains, and throughout the province are several other chains, all of them running from southeast to north-west. A great portion of the surface of the province consists of elevated tablelands, but there are also numerous fertile valleys traversed by rivers. Many of the rivers of 1, are swallowed lap by sandy tracts into which they flow. The chief towns of the province are the capital Teheran and Ispalian.

IRAK-A'RABI, a district in Turkey in Asia, the aucient Babylonia (q. v.), comprises the rains of the aucient cities of Babylon, Selencia, and Ctesiphon. During the last 250 years of the califact, this was the poor remnant of their once wide dominion which remained to the successors of Mohammer.

IRA'N, the modern native name of Persia. See ARVAN RACE.

IRBIT, a district town of the government of Pern, Eastern Russia, since 1775; touded (1635) by Russian emigrants. The town is situated on the rivers Irbit and Nitza, in lat. 57° 35° N., and long, 62° 50° E, is 1760 miles distant from St Petersburg, and contains 3248 inhabitants. It is remarkable for its extensive fair, the largest in Russia, after that of Nijan-Novgerod. The fair takes place annually from the 27th of February more than 200 years, and attracts about 10,000 merchants and visitors from Russia, Siberia, Persia, Bokhara, &c. The principal goods are cloths, silk stuffs, brocades, sugar, coffee, chima, and hardthrough Kiachta; furs and lish from Siberia; cotton stuffs from Bokhara, &c. The whole quantity of goods brought to market is valued at 25,500,000, of which more than three-quarters are generally of which more than three-quarters are generally

I'IBLIAND, an island, forming part of the United Kingdom of Great Britain and Ireland, lies between lat. 51: 26' and 55' 23' N., and long, 5' 20' and 10' 26' W. It is washed on the X., W., and S. by the Atlantic, and on the E. by a strait, called at different places the North Channel, the Irish Sea, and St George's Channel, which separates at from the larger island of Great Britain. Its greatest length, from Fair Head in Antrim to Crow Head in Kerry, is 306 miles, but its greatest meridional length is not more than 225; its greatest hreadth, between the extreme points of Mayo and Down, is 182 miles, but between Galway Bay and Dublim, it is not more than 12's Area about 25,2'd square is not more than 12's Area about 25,2'd square and Comanglet, which again are subdivided into 32 counties. The following table exhibits some in portant statistics:

Physical Aspect.-1. is of oblong form, and like Great Britain, the eastern coast is comparatively unbroken, while the west, north, and south are deeply indented. It is an undulating or hilly country-less rugged than the Highlands of Scotland, and not so tame as the eastern section of England. Its hills are more rounded than abrupt, and lie not so much in ranges as in detached clusters round the coasts. These mountain tracts rarely extend more than twenty miles inland, and they seem to form a broad fringe round the island while the interior appears as a basin composed of flat or gently swelling land. The principal ranges are the Mourne Mountains in Down, which attain their highest elevation in Slieve Donard, 2796 feet above the sea; the mountains of Wicklow, which rise to a height of 3039 feet; and Macgillienddy Recks in Kerry, which, in the peak of Carran-Tual the loftiest point in Ireland, reach 3414 feet. The purely flat or level portions of the island, with the exception of some fine tracts of fertile valleyland in Kilkenny, Tipperary, and Limerick, consist mainly of bog or morass, which occupies, according mainly of bog of morass, which occupies, sections to Dr Kane, 2,830,000 acres, or about a seventh part of the entire superficies. The largest of these morasses is the Bog of Allen, which stretches in a vast plain across the centre of the island, or over

a large portion of Kildare, Carlow, King's and Queeu's counties—having a summit elevation of 280 feet. Extensive tracts of deep wet bog also occur in Longford, Roscommon, and other counties, and give a peculiarly dreary and desolate aspect to the scenery. Notwithstanding the quantity of water in these bogs, they exhale no masma injurious to health, owing to the large quantity of tannin which

they contain.

Hudrography.-The principal river of I., and the largest in the United Kingdom, is the Shannon (q. v.). The streams which drain the eastern part of the central plain are the Liffey and the Boyne; or the central plan are the Liftey and the Boyne; the south-eastern part, the Suir, the Barrow, and the Nore; while the waters of the north-eastern part are collected into Lough Neagh, chiefly by part are confected into Lougn Neagh, cheffy by the Blackwater, and thence discharged into the sea by the Lower Bann. The rivers external to the great central plain are necessarily short. The principal are the Erne, flowing to the north-west; the Foyle and the Bann, to the north; the Lagan, the royre and the bann, to the north; the Lagan, to the north-east; the Slaney, to the south-east; and the Banden, Lee, and Blackwater, flowing in an easterly course through the country of Cork, the most southern country in the island. None of these rivers are naturally of importance to navigation. The Shannon, however, has been made navigable to its source by means of locks and lateral cuts; the Barrow, by similar means, to Athy; the Foyle, by canal to Strabane; and several of the others have been artificially united by such lines as the Lagan, Newry, Ulster, Royal, Grand, Athy, and other canals—which now intersect a considerable portion of the island.

The lakes of I. (called longhs) are, as might be expected from the surface-character of the country, both numerous and extensive in proportion to the size of the island. The largest is Lough Neagh in Ulster, covering an area of 100,000 acres. The other loughs of consequence are Loughs Erne and Derg, also in Ulster; Conn, Mask, and Corrib, in Connaught; the Allen, Ree, and Derg, which are expansions of the river Shannon, and the lakes of Killarney (q. v.) in Kerry.—The bays and salt-water loughs which indent the island are also numerous and of considerable importance. About seventy are suitable for the ordinary purposes of commerce; and there are fourteen in which the largest menand there are fourteen in which the largest men-of-war may ride in safety. The principal are Loughs Foyle and Swilly, on the north coast; the Bays of Donegal, Sligo, Clew, and Galway, the estuary of the Shannon, Dingle Bay, and Bantry Pay, on the west; the harbours of Cork and Waterford, on the south; Wexford harbour, the Bays of Dublin, Drogheda, and Dundalk, and Loughs Carlingford, Strangford, and Belfast, on the east. The islands are, generally speaking, small and of little importance. On the east coast, the largest is Lambay, about two and a half miles off the coast of Dublin; on the south and south-east coasts are Clear Island, the Saltees, a dangerous group of islets, about eight miles south of the Wexford coast, indicated by a floating light, and Tuscar Rock, about eight miles east of Carnsore Point, also a dangerous ledge, rising 20 feet above the sea, and surmounted by a light-house after the model of the Eddystone; on the west coast, the Skelligs, Valentia, the Blaskets, the South Arran Isles, Innisbofin, Innisturk, and Clare, Achil or 'Eagle' Island, and the Innisken Islets; on the north coast, the North Arran Isles, the Tory Isles, and Rathlin.

Geology.—A great series of grits and slates of Cambrian age occur in the south-east of I.; the

consist of flags, slates, and grits many thousand feet in thickness, extending over large portions of Kildare, Wicklow, Wexford, and Waterford. Several detached patches occur to the west of this district, forming the Keeper, Arra, and Inchiquin Mountains.
A tract of similar heds stretches from the centre of I., near the source of the Shannon, to the coast of Down. The strata in proximity to the Wicklow and Dublin gravites are converted into gneiss and mica-slate. This is the condition of all the beds in the north-west, in Donegal, Tyrone, and Mayo; they appear to be a continuation of the highly altered strata of the north of Scotland. Detached portions of Upper Silurian measures occur on the western

of Upper Silurian measures occur of the western side of the island, in Kerry, Galway, and Mayo. Between the Silurian and Old Red Sandstone is an enormous thickness (11,000 feet) of sandstone grit and shale in Kerry and Cork. No fossils grit and shale in Kerry and Cork. hitherto have been found in these strata.

Old Red Sandstone strata, consisting of red and yellow sandstone and slate, cover a large tract of the south of I., stretching almost continuously from the extreme west of Cork and Kerry into Waterford and Kilkenny, being stopped by the Silurian rocks of Wexford and Carlow. Along the bases of the Silurian mountains of the south centre of I., and in the southern portion of the county of Cork, occurs a great thickness of sandstones, which have hitherto yielded no fossils; some geologists refer these to the Old Red series, others hold them to be Lower Carboniferous,

The Carboniferous Limestone is extensively developed in I., occupying the whole of the centre of the country, except in those places already alluded to, where the older rocks appear on the surface. This great tract is an extensive plain covered with drift, and with peat-moss and freshwater marl, in which are found the remains of Megaceros Hibernicus and Bos longifrons. In Kerry, Cork, and Waterford, the strata are very much contorted, the coal-seams are changed into anthracite, and so squeezed and crushed as to be got only in small dice-like frag-ments. Further north, the strata are nearly hori-zontal, but the coal-fields are limited, and the seams are generally of inconsiderable thickness. They occur

are generally of measurements the measurements. They occar-chiefly in Tipperary, Kilkenny, Tyrone, and Antrim. Small deposits of Permian strata are found at Ardtrea in Tyrone, and at Cultra near Belfast; the sandstones of Roan Hill near Dungamon are the sandstones of Roan IIII near Dungannon are probably of the same age. The red and variegated marks containing beds of gypsun and rock-salt, which exist on the coast north from Belfast, are probably Triassic. Resting on these marks are a few thin beds of Lias. Cretaceous strata occur in

Antrim and Derry.

Climate.—Though the climate of I. bears, as might have been expected, a strong resemblance to that of Great Britain (q. v.), it has yet a character peculiar to itself, owing to the marked difference in the configuration of its surface, its greater distance from the continent of Europe, and its being, as it were, more completely bathed in the warm waters of the Gulf Stream. The mean annual temperature of the central parts of the country is about 50°0, rising in the south to 51°-5, and falling in the north to 48°-5. There are thus 3°0 of difference between the extreme north and south, and it may be noted the extreme north and south, and it may be noted that, speaking generally, this difference is constant through all the seasons of the year. The mean temperature in winter is 41°5; in spring, 47°0; in summer, 60°0; and in autumn, 51°0.

The annual rainfall averages from 25 to 28 inches, Combrian age occur in the south-east of L; the upper portion contains a few fossils of zeophytes and worms. Lower Silurian stata rest unconformably on the Cambrian rocks in the same district. They to 73 inches, and doubtless this large fall was greatly exceeded in those parts which are situated among the higher hills. The rainfall in winter, particularly in the west, is greatly in excess of the other seasons, owing to the low temperature of the surface of the ground during winter, which suddenly chills the warm and moist south-west winds that prevail, especially at this time of the year, and condenses their vapour into rain. Since in Great Britain tue chief mountain ranges are in the west, it follows that over the whole eastern slope of the island the climate is drier, the amount and fre-quency of the rainfall much less, and the sunshine more brilliant than in the west. In I., on the other hand, the hills in the west do not oppose such a continuous barrier to the onward progress of the south-west winds, but are more broken up and distributed in isolated groups. It follows that the sky is more clouded, and rain falls more frequently in L, and the climate is thus rendered more genial and fostering to vegetation; hence the appropriateness of the name 'Emerald Isle.' Again, owing to its greater distance from the continent, the parching and noxious east winds of spring are less severely felt in I., because the north-east winds have acquired more warmth and moisture in their progress. It is on this account that the most salubrious spring climates possessed by England, Scotland, and I are situated in the south-west of their respective countries. Thus, Queenstown, in the south-west of L, enjoys an average spring temperature as high as 50°0, which is about the highest in the British Islands, and nearly 3°0 higher than the east of Kent, which is nearly in the same latitude.

Since wheat ripens in these latitudes with a mean summer temperature of 56°0, it follows that the climate of I. is quite sufficient for the successful cultivation of the finer sorts of grain, which are subjected to much less risk in backward seasons than is the case in North Britain, where the summer temperature is only a degree and a half from the extreme limit of wheat-cultivation. Also, considering its remarkably open winters, which lengthen out the period of grazing, its mild and genial climate through all the seasons, and its comparative freedom from droughts, it will be seen that its climate is equally well adapted for the rearing of cattle. These considerations, combined with the fertility of the soil, open up for I., as far as the physical conditions are concerned, a prospect of great national prosperity, based on most remarkable, though as yet only partially developed agricultural resources.

objection is evenly a remaind the account of the control and the control as weet-bed, though the soil is generally fertile. From information had before Parliament in 1870 it appears that there are 682,000 farms, of which 512,898 are valued at less than £18 per annun; 94,908 at £18 and under £36; 38,534 at £36 and under £60; 24,857 at £60 and under £120, and 72,668 at £120 and upwards. Of these farms £26,539 are tenancies at will, 83,287 are let on extremely long lenses, and 20, 267 only are in the occupation of proprietors in fee.

The acreage under each of the principal crops in 1861, 1868 and 1870 is given in the following table:

				Extent Cultivated in

Live Stock.—According to the returns of 1870 there were in I. 530,353 horses, 1,566,149 cattle, 4,330,947 sheep and lambs, and 1,456,901 pigs. The value of the live stock in 1870 was estimated at £35,518,468.

new sock in 1870 was estimated at 2.35,218,468. Folderica. In her fisheries, I, possesses an almost inexhaustible mine of wealth, but, strange to say, it is almost entirely neglected. The surrounding seas swarm with cod, ling, hake, herrings, pilchards, &c., and yet the Irish markets are extensively supplied with cured fish from Scotland and the Isle of Man. The number of boats engaged in the sca-fisheries in 1855 was 1250, employing 49,754 men and boys, and these numbers are on the decrease, owing, it is said, to the continuous emigration from the scaport towns, and the great demand for seamen.

Manufactures.-According to M'Culloch, 'Ireland is not, and never has been, a manufacturing country. Its unsettled turbulent state, and the general dependence of the population on land, have hitherto formed insuperable obstacles to the formation of great manufacturing establishments in most parts of the country; whilst the want of coal, capital, and skilful workmen, and the great ascendency of England and Scotland in all departments of manufacture, will, there is reason to think, hinder Ireland from ever attaining eminence in this department.' Linen is the staple manufacture, of which Belfast and the surrounding districts of Ulster are the chief seats. The annual value of the linen now exported from I. to Great Britain and all foreign countries reaches about £4,400,000. The manufacture of woollen stuffs is limited to a few localities, as Dublin, Cork, King's County, Waterford, Queen's County, and Kilkenny, Silk and cotton manufactures are also carried on, but only to a comparatively inconsiderable extent. In 1861, the number of factories (cotton, woollen, worsted, flax, jute, and silk) in L amounted to 158. employing 739,205 spindles, 6560 power-looms, and 37,872 persons of both sexes; of these, 100 were flux-factories, employing 592,981 spindles, 4666 power-looms, and 33,525 persons of both sexes. In 1864, 209,859,714 yds. of linen goods were exported, valued at £7,591,535, which was an increase of 88 per cent. in 3 years. Belfast is the centre of this nunufacture. which employs about 300,000 persons, chiefly femules, scattered through all the counties of Ulster, and some localities of the other provinces. About forty firms were engaged in the trade in 1863; one firm in Lisburn produces 250,000 pieces of blenched linen goods annually. Poplin is extensively manufactured in Dublin, &c.

Commerce and Singing.—The exportation of the agricultural produce of the country in a slivary being the chief commercial basiness carried on in Ireland, the chief commercial basiness carried on in Ireland, which is the chief commercial basiness carried on in Ireland, with Great Britain. It cannot, however, he troop a later than 1825, when the commercial intercourse between Great Britain and I. was assimilated by law to the coasting-traffic earried on between the coasting-traffic earried on the coasting-traffic earried on the coasting-traffic earried on a strength of the coasting-traffic earried on the coasting-traffic earried on a strength of the coasting-traffic earried on the

The number and tonnage of vessels entered and

cleared out at the 19 principal Irish ports, in the Coasting, Colonial, and Foreign Trades in 1861, were as follows: vessels, 44,189; tonnage, 7,144,538. Government.—The government of I., since the

Union in 1800, is identical with that of Great Britan, it is represented in the imperial parliament by 32 members of the House of Lords, and 105 of the House of Lords, and 105 of the House of Lords, and 105 of the Council and Chief Secretary, and the law is administered by a Lord Chancellor, a Master of the Rolls, and twolve judges of the supreme courts of Queen's Bench, Common Plens, and Lordscheller, and twolve judges of the supreme courts of Queen's Bench, Common Plens, and Lordscheller, the Lordscheller, and the same way as in England, with the exception of an armed national constabulary or police force of nearly 12,000 men, with 348 horses.

Religion.—A vist majority of the inhabitants of 1. are Roman Catholics. A bill to dis-establish the Irish Episcopal Church in January, 1871, was passed in July, 1893. According to the statistics of 1861, the proportion was as follows: Roman Catholics, 4,505, 414; Episcopalians, 861,509 Presbyterians, 323,300; Methodists, 45,390; Independents, 4530; Baptists, 4225; Friends, 39595; Jews, 385; all other persua-

sions, 19,784.

Education.—I. possesses several universities: Dublin University (c. v.), was founded by Queen Elizabeth in 1501; the Queen's Colleges of Belfast, Cork, and Galway, were opened in 1849, and are united in one university. Maynooth College, for the education of Founa Catholie priest, is supported at the public expense, and is attended by 620 students, schools in connection with the London University. The primary schools of I. are mostly under the management of the 'Commissioners of National Education.' This system, established in 1833, proceeds on the principle that the schools shall be open alike to Christians of every denomination; that no pupil shall be required to attend any religious exercise, or receive any religious instruction which his parents may not approve; and that cach collisions persuasion to receive separately such religious instruction as their parents or guardians may think fit. The following table exhibits the progress of the system;

Years.	No. of	No.	Parliamentary	
	Schools.	of Pupils.	Orants.	
1840	1,978	233,560	£50,000	
1846	3,637	456,410	100,000	
1850	4,547	511,239	140,000	
1855	5,124	535,902	227,641	
1860	5,632	804,000	285,377	
1868	6,520	913,198	360,195	

Taking the pupils of 1861, we find the number of Roman Catholic children to be 486,206; of Presbyterian, 64,687; of Episcopalian, 34,717; belonging to other sects, 3402. Besides these national schools, the 'Church Education Society' had (1855) 1827 schools, attended by 90,572 pupils, of whom 17,000

were Roman Catholics.

History.—According to ancient native legends, It was in remote times peopled by tribes styled Eirbolgs and Danauns, eventually subdued by Milesians or Gaols, who acquired supremacy in the island. The primitive inhabitants of I. are now believed to have been of the same Indo-European race with the original population of Britain. Although I. styled Iernis, is mentioned in a Greek poem five centuries before Christ, and by the names of Hibernia and Juserna in various foreign pagan writers, little is known with certainty of her inhabitants before the 4th c after Christ, when, under the appellation

of Scott, or inhabitants of Scotta, they became formidable by their descents upon the Roman province of Britain. These expeditions were continued and extended to the coasts of Gaul till the time of Lacquire MacNeill, monarch of Ireland (43) A.D., in whose reign St Patrick (q. v.) attempted the conversion of the natives. Although Christianity had been previously introduced in some parts of the island, Patrick encountered great obstacles, and the new faith was not fully established in I. till

about a century after his decease.

From the earliest period, each province of L appears to have had its own king, subject to the Ard-Righ or monarch, to whom the central district called Meath was allotted, and who usually resided at Tara. Each clan was governed by a chief selected from its most important family and who was required to be of mature age, capable of taking the field efficiently when occasion required. The laws were peculiar in their nature, dispensed by professional jurists styled Brehons, who, as well as the poets and men of learning, received high consideration, and were endowed with lands and important privileges. Cromlechs, or stone tombs and structures, composed of large uncemented stones, ascribed to the pagan Irish, still exist in various parts of Ireland. Lacustrine habitations, or stockaded islands, styled Crannogs or Crannoges (q. v.), in inland lakes, also appear to have been in use there from early ages. Of articles of metal, stone, clay, and other materials in use among the stone, clay, and other materiats in use among the ancient Irish, a large collection has been formed in the Museum of the Royal Irish Academy at Dublin. It is remarkable that a greater number and variety of antique golden articles of remote age have been found in I. than in any other part of Northern Europe; and the majority of the gold antiquities illustrative of British history, now preserved in the British Museum, are Irish.

In the 6th c., extensive monasteries were founded in I., in which religion and learning were zealously cultivated. From these establishments, numerous missionaries issued during the succeeding centuries, carrying the doctrines of Christianity under great difficulties into the still pagan countries of Europe, whose inhabitants they surprised and impressed by their self-devotion and asceticism. Many students of distinction from England and the continent frequented I., and received gratuitous instruction at this period. To these ages has been ascribed the origin of the peculiar style of art-ornamentation, specimens of which are still extant in Irish manuscripts, and which was long erroneously assigned to the Anglo-Saxons, who now appear to have been indebted to the Irish mainly for Christianity, and entirely for letters. Among the eminent native Irish of these times were Columba (q. v.), or Colum Cille, founder of the celebrated monastery of Iona; Comgall, who established the convent of Bangor, in the county of Down; Ciaran of Clonmacnoise; and Adaman, abbot of Iona, and biographer of Columba. Of the Irish missionaries to the continent, the more distinguished were Columbanus (q. v.), founder of Bobio; Gallus of Columbianus (q. v.), founder of Bonio; Gallus of St Gall, in Switzerland; Dichuill, patronised by Clotaire; and Ferghal, or Virgilius, the evangeliser of Carinthia. The progress of Irish civilisation was checked by the incursions of the Scandinavians commencing towards the close of the 8th c., and continued for upwards of 300 years. Establishing themselves in towns on the eastern coast of L, with the assistance of friendly native tribes, they continued to make predatory expeditions into the interior until their signal overthrow at the battle of Clontarf, near Dublin (1014 a.D.), by Brian, surnamed Borumha, monarch of Ireland. From the

close of the 8th to the 12th c., L., although harassed by the Scandinavians, produced many writers of merit, among whom were Aingus, the hagiographer; Cormac MacCullenan, king of Munster, and Bishop of Cashel, the reputed author of Cormac's Glossary; Cnan O'Lochain; Gilla Moduda; Flan of Monasterbeice; and Tigerhuach, the annalist. The Irish scholars who during these times acquired highest eminence on the continent were Joannes Erigena, the favourite of Charles the Bald of France; Dungal, one of the astronomers consulted by Charlemagne; Dichnill, the geographer; Donogh, or Donatus, Bishop of Fiesole; and Marianus Scotus. Of the state of the arts in Ireland during the same period, elaborate specimens survive in the shrine of St Patrick's bell, the Cross of Cong, in Mayo (12th c.); the Limerick and Cashel crosiers, and the Tara brooch, all displaying minute skill and peculiar style. To these times some are inclined to assign the Book of Kells, a Latin copy of the four Gospels in the Irish character, in the library of Trinity College, Dublin, which Mr Westwood has pronounced to be the most elaborately executed manuscript of early art now in existence, and of portions of which fac-similes are given in his work Palatographia Sacra Pictoria. Of the Irish architecture of the period, examples survive at Cashel. The well-known round towers of 1. are believed to have been erected about this era as belfries, and to serve as places of security for ecclesiastics during disturbances. The skill of the Irish musicians in the 12th c. is attested by the enthusiastic encomiums bestowed by Giraldus Cambrensis upon their performances. The Scandinavians have left behind them in I. no traces of civilisation except coins struck at Dublin, Waterford, and Limerick, in which towns they were, for the most part, subject and tributary to the natives.

The first step towards an Anglo-Norman descent The first step towards an Angio-Norman descent upon I was made by Henry II., who obtained in 1155 a bull from Pope Adrian IV., authorising him to take possession of the island, on condition of paying to the papal treasury a stipulated annual revenue. Political circumstances prevented Henry from entering upon the undertaking till 1166, when Dermod MacMurragh, the deposed king of Leinster, repaired to him, and obtained authority to enlist such of his subjects as might be induced to aid him in attempting to regain his forfeited lands. Dermod, returning to 1, in 1169, with the aid of his foreign mercenaries, and still more numerous Irish allies, succeeded in recovering part of his former territories, and in capturing Dublin and other towns on the eastern coast. After his death in 1171, the succession to the kingdom of Leinster was claimed by his son-in-law, Richard FitzGislebert, Earl of Pembroke, surunmed 'Strongbow.' In the following year, King Henry, with a formidable armament, visited 1., received homage from several of the minor nativo chiefs, and from the chief adventurers, granting to the latter charters authorising them, as his subjects, to take possession of the entire island, in virtue of the grant made to him by the pope. The chief Anglo-Norman adventurers, FitzGislehert, Le Gros, De Cogan, De Lacy, and De Curci, encountered formidable opposition before they succeeded in establishing themselves on the lands which they thus claimed. The government was committed to a viceroy, and the Norman logal system was introduced into such parts of the island as were reduced to obedience to England. The youthful Prince John was sent by King Henry into I, in 1154: but the injudicious conduct of his council having excited disturbances, he was soon recalled to England. John, when king, made an expedition

into I, in 1210, to curb the refractory spirit of his barons, who had become formidable through their alliances with the natives. During the 13th c., the principal Anglo-Norman adventurers suceceded in establishing themselves, with the feudal institutions of their nation, in some parts of 1., by the assistance or suppression of native clans. The Fitzgeralds, or Geraldines, acquired almost unbounded power in Kildare and East Munster, or Desmond; the Le Botillers, or Butlers, in Ormond or West Munster: and the De Burghs or Ornional or west Munister; and the De Burgus, or Burkes, in Connaught. After the battle of Ban-nockburn, the native Irish of the north invited over Edward Bruce, and attempted to overthrow the English power in Ireland. The court of Rome, at the instigation of England, excommunicated Bruce with his Irish allies; but although his enterprise failed of success, the general result was a comparative collapse of the English dominion in Ireland. The descendants of the most powerful settlers gradually became identified with the natives. whose language, habits, and laws they adopted to so great an extent, that the Anglo-Irish parliament passed, in 1367, the 'Statute of Kilkenny,' decreeing excommunication and heavy penalties against all those with, the native Irish. This statute, how serves with the native trish. This statute, now-ever, remained inoperative; and although Richard II., later in the 14th c., made expeditions into I. with large forces, he failed to effect any practical result; and the power and influence of the natives increased so much, that the authority of the English crown became limited to a few towns on the coast, and the district termed 'the Pale,' comprising a small circuit about Dublin and Drogheda.

In 1534, Thomas Fitzgerald, son of the viceroy of Henry VIII., revolted, but not meeting with adequate support from his Anglo-Irish connections, he was, after a short time, suppressed and executed. Henry received the title of 'King of Ireland' in 1541, by an act passed by the Anglo-Irish parliament in Dublin; and about the same period, some of the native princes were induced to acknowledge him as their sovereign, and to accept peerages. The doctrines of the Reformation met little favour either with the descendants of the old English settlers or with the native Irish. About the middle of the 16th c., Shane O'Neill, a prince of the most powerful 16th c., Snane O Neil, a prince of the most powerful ancient family of Ulster, attempted to suppress his rivals, and to assume the kingship of that province, in which he was eventually unsuccessful; but after his death in 1567, his successor received the title of Earl of Tirone from Elizabeth. The attempts of the English government in I. to introduce the Reformed faith and English institutions stirred up great dissensions in Ireland. Among the first to revolt was the Earl of Desmond, after whose death, in 1583, his vast estates in Munster were parcelled out to English settlers. Soon after, the chief clans of Ulster took up arms; and in opposing them, the forces of Elizabeth, commanded by officers of high military reputation, encountered many reverses, the most serious of which was that in 1598 at the battle of the Yellow Ford, near Armagh, where the English army was routed and its general slain, Philip III. of Spain, at the solicitation of the Irish chiefs, despatched a body of troops to their assistance in 1601, which, landing in the extreme south, instead of in the north, as had been expected, were unable to effect anything, and were constrained to surrender. Although Elizabeth was supported by numbers of native Irish, the northern chiefs, O'Neill and O'Donnell, held out till the queen's government eame to terms with them in 1603, recognising them as Earls of Tirone and Tirconnell. In 1608, these nohlemen, having apprehensions for their personal

afety, quitted Ireland unexpectedly, and retired to Their withdrawal enabled James L. the continent. to carry out that project of parcelling out the north of Ireland to Scottish and English settlers, which is usually known as the 'Plantation of Ulster.' The Irish took advantage of the contentions in England to rise in insurrection (1641) and massacre the Protestants. It is believed that nearly 40,000 fell victims to their fury. The country continued in a state of anarchy till 1649, when Cromwell overran a state of anarchy the 1648, when Cromben overrain it. At the Revolution, the native Irish generally took the part of James II., the English and Scotch 'colonists' of William and Mary; and the war was kept up for four years (1688-1692). From this time till 1778, history records little beyond the passing of penal statutes against the Roman Catholics. In 1778, parliament relaxed the stringent pressure of these acts; but the widely spread disaffection which they caused gave birth to numerous societies, resulting in the rebellion of 1798, which was not suppressed till 1800. On January 1 of the following year, the legislative union of Great Britain with L was consummated, and from this period the history of the country merges in that of Great Britain.

IRELAND, ARMS OF. The insignia of Ireland have been variously given by early writers. In the reign of Edward IV., a commission appointed to inquire what were the arms of I, found them to be three crowns in pale. It has been supposed that these crowns were abandoned at the Reformation, from an idea that they might denote the fendal sovereignty of the pope, whose vassal the king of England was, as lord of Ireland. However, in a MS. in the Heralds' College of the time of Henry VII., the arms of L are blazoned azure, a harp or, stringed argent; and when they were for the first time placed on the royal shield on the accession of James I., they were thus delineated: the crest is on a wreath or and azure, a tower the crest is on a wreath or and azure, a rower (sometimes triple-towered) or, from the port, a hart springing argent. Another crest is a harp or. The national flag of L exhibits the harp in a field vert. The royal badge of L, as settled by sign-manual in 1801, is a harp or, stringed argent. and a trefoil vert, both ensigned with the imperial crown.

IRELAND, New. See New IRELAND.

IRELAND ISLAND, one of the Bermudas (q. v.).

IREN.EUS, one of the most important of the ante-Nicene Christian writers, was an Asiatic by birth, but is known in history solely through his connection with the Greco-Gaulish church of Southern France, of which he was a bishop. He was a scholar of Polycarp, through whom he may be regarded as having sat at the feet of St John the apostle and evangelist. I was a priest of the church of Lyon under the Bishop Pothinus, upon whose martyrdom, in the persecution of Marcus Aurelius in 177, he was himself elected to the same see, which he continued to govern for twenty-five years. is commonly believed to have suffered martyrdom at Lyon in the persecution under Septimius Severus in 202. His principal, indeed almost his only perfect, work is that which is commonly cited as Adversus Haresus (Against Heresies). It is directed against the Gnosticism of his own age, and is most valuable as a picture of the doctrinal and is most valuable as a picture of the doctrical between which a man and moral condition of that age. Most of his may walk erect with a Pashinba Palm (Friartea other works also were doctrinal, but they are palm of seventy feet known only by description or by fragments. The high raing straight earliest edition of the works of this Father is that above his head. The ooter wood is very hard, so of Erasmus (Basel, 1526). They have been several as to be need for harpoons; splits easily, and into times ex-edited, the most prized edition being that perfectly straight laths; is excellent for floors,

of the Benedictine, Dom Massuet (Paris, 1710, and Venice, 1734).

IRENE, a celebrated Byzantine empress, was born in Athens about 752 A.D. Her beauty and talent excited the admiration of the Emperor Leo IV., who married her, 769 A.D. She is believed to have poisoned her husband, 780 a.D., after which nave posemen oner nusualni, 30 A.B., acter which were the became regent during the minority of her son, Constantine VI., then only nine years of age, a great worshipper of images—in fact, this species of idolatry had during the lifetime of her husband caused her to be banished from the imperial palace -she quickly began to plot for their restoration, and with this purpose assembled a council of bishops at Constantinople, 786 A.D., which, however, was broken up by the troops of the capital. A second council held at Nice in the following year was more successful, and image-worship was re-established in the Eastern Church. In 788 a.D., her army was defeated in Calabria by Charlemagne, who threatened the Byzantine empire. In 790 A.D., Constantine succeeded in taking the government out of her hands; but seven years after, she caused him to be deprived of his eyes, and shut up in a dungeon, where he soon died. Still she was not free from anxieties. Her two favourites, Stanracius and Ætius, were constantly embroiled with each other, and their jealousies only ceased with the death of the former, 800 a.D. She now tried to secure her possession of the throne by a marriage with Charlemagne, but the Frank emperor had apparently no relish for a woman who had committed so many crimes, and the scheme proved abortive. Two years later, her treasurer, Nicephorus, rebelled against her, and suddenly seizing her person, banished her to the isle of Lesbos, where she was forced to spin for a livelihood. Here she died of grief, 803 A.D. L. was a wise, able, and energetic ruler; but her crimes were so great and unnatural, that history can speak of her character as a whole only in the language of reprobation. The Greek Church, however, on account of her zeal for image-worship, has placed her in the catalogue of its saints.

IRIARTEA, a genus of palms, all South American, having loity, smooth, faintly ringed stems, and pinnate leaves with somewhat triangular leaflets. The leaf-stalks rise from

a sheathing column. The PASHIUBA OF PIZIUBA PALM (I. exorhiza), common in swamps and marshy grounds in the forests of the Amazon district, is remarkable for sending out roots above ground, which extend obliquely downwards, and often divide into many rootlets just before they reach the soil; the tree as it grows still producing new roots from a higher point than before, whilst the older and more central ones die, so that at last a lofty tree is supported as on three or four legs, between which a man

ceilings, shelves, &c.; and is exported to North North America. The flowers of most of the species America for umbrella-sticks.

IRIDE', E. or IRIDA'CE, E. a natural order of endogenous plants, mostly herbaceous, although a few are somewhat shrubby. They have very generally either root-stocks or corms. The leaves are generally sword-shaped, in two rows, and equitant (so placed that one seems to ride on the back of another). The perianth is 6-partite, coloured, often very beautiful, in some regular, in others irregular. The stamens are three, with anthers turned outwards. The ovary is inferior; there is one style, with three stigmas, which are often petal-like, and sald much to the beauty of the flower. The fruit is a 3-celled, 3-valved capsule. Almost 600 species are known, of which the greater number are natives of warm countries. They are particularly abundant in South Africa. A few are British. Iris, Gladiolus, and Crocus are familiar examples of the order. Saffron is the principal economical product. Acridity is a prevailing characteristic, and some species are medicinal; but the corms and root-stocks of some are edible.

IRI'DII'M (sym. Ir, eq. 99.13, sp. gr. 21.15) is one of the so-called noble metals. It is occasionally found native and nearly pure in considerable masses among the Uralian ores of platinum, but is usually combined with osmium as an alloy in flat scales. It is a very hard, white, brittle metal, which may be melted by the oxyhydrogen blowpipe, or by the heat of a voltaic current. In its isolated form, it is unacted upon by any acid, or by aqua regia, but as an alloy it dissolves in the latter fluid.

It forms four oxides, Ir2O, Ir4O, Ir2O2, and Ir2O3, which pass readily into one another, and thus occasion the various tints which solutions of the salts of this metal assume. It was in consequence of these varying tints that the name of iridium, derived from Iris, the rainbow, was given to this metal. Four sulphides and chlorides, corresponding to the oxides, have been obtained. This metal was discovered at the same time as osmism (1803), by Smithson Tenpent

I'RIS, in Classic Mythology, the daughter of Thaumus and Electra. She is described (in Homer) as a virgin goddess; but later writers state that she was married to Zephyrus, by whom she became the mother of Eros. She was employed, like Mercury, as the messenger of the gods, and to conduct female souls into the shades, as he conducted those of men. She is frequently represented on vases and in basreliefs as a youthful winged virgin, with a herald's staff and a pitcher in her hands. There can be no doubt that this myth originated in the physical phenomena of the rainbow, which was personified at first as the messenger of peace in nature.

The broad coloured ring in the eye is called the IRIS. See EYE .- IRIS is also the name of one of the Planetoids (q. v.), discovered in 1847.

IRIS or FLOWER-DE-LUCE, a cenus of plants of the natural order Iridea, having the three outer segments of the perianth reflexed, the three inner arched inwards, and three petal-like stigmas covering the stamens. The species are numerous, chiefly natives of temperate climates. The YELLOW I., or CORN FLAG (I. pseudacorus), is a well-known native of moist grounds in all parts of Britain, often spreading over a considerable extent of land, and conspicuous even at a distance by its tall leaves and large deep yellow flowers. The STINKING I. (I. fatidissima) is very abundant in some of the

attention from florists, particularly I. xiphium, sometimes called Spanish I.; I. ziphioides, or English I.: and I. Germanica, or Common I., all corm-rooted

I. Yellow Water Flag 2. Florentine Orris (Iris pseudacorus). (Iris Florentina).

species, and all European. Many fine varieties have been produced. The Persian I. (I. Persica), the Snake's-head I. (I. tuberosa), and the Chalce-DONIAN I. (I. Susiana) are also much esteemed. The Persian I. is delightfully fragrant The roots of all these species are annually exported in considerable quantities from Holland. Many other species are of frequent occurrence in flower-gardens .- The common blue flag of marshes on the Atlantic coast are L. virginica and I. versicolor; the dwarf-iris of the West and South are I. verna, cristata, and lacustris. The dried root-stocks of I. Florentina, I. pallida, and I. Germanica are Orris Root (q. v.). Those of I. dicholoma are eaten in Siberia; those of I. edulis in South Africa.

IRISH (GAELIC) LANGUAGE AND LITER-ATURE. The Irish (Gaelie) is one of the still living Celtic languages (see CELTIC NATIONS). The alphabet consists of the following eighteen lettersa, b, c, d, e, f, g, h, i, l, m, n, o, p, r, s, t, u, corresponding in their forms with the Roman characters of the 5th e. after Christ. In Irish, there is no indefinite article; nouns are masculine or feminine, and anciently a neuter gender existed. The nominative and accusative are the same in form, as are also the dative and ablative; the nominative and vocative feminine, and the genitive and vocative masculine, always have similar terminations. Nouns substantive have five, and nouns adjective four declensions. Verbs are active, passive, regular, irregular, impersonal, and defective; their moods are indicative, consuctudinal, past indicative, imperative, infinitive, and conditional; regular active verbs have no subjunctive; the tenses are the present, consuctudinal present, preterite, consuctudinal past, and future; in the tenses of the passive voice there is no distinction of number or person. Prepositions are rarely compounded with verbs or adjectives, instead of which the Irish use prepositions or adverbs placed after the verbs. Adverbial phrases composed of two or more parts of speech southern parts of England, but does not extend far are very numerous both in ancient and in modern north. It has livid purple flowers. The leaves have Irish. The sample conjunctions are few, but there are very discretelle smell. The south of Europe are many conjunctional phrases. Interjection are produces a greater number of species, as also does numerous, and vary throughout the provinces. The regular versification of the Irish consists of four distinct metres, styled Oglachas, Droighneach, Bruilingeacht, and Dan Direach; of the last, there are five species, each distinguished by peculiar are five species, each distinguished by peculiar features. There are also classes of popular pectry possessing distinct linear and syllable components. The best authorities on the Irish language are the Irish Grammer, by J. O'Domovan (1845); the Grammetic Celtica of J. C. Zeuss (1866); and Irish Gosses (1860), published by the Irish Archa-ological and Celtic Society.

The oldest existing specimens of the Irish language are to be found in sepulchral inscriptions in Ireland, and in the glosses or interpretations affixed to Latin words in documents transcribed by Irish ecclesiastics of the 8th and succeeding centuries, now preserved in some continental libraries. The principal ancient vernacular manuscripts in The principal ancient vertacular manuscripts in Ireland are Leablar na-h-Uidhre, and the Book of Leinster (12th c.); the Books of Ballymote, Lecan, and Dun Doighre, or Leabhar Breac (14th c.); all compiled from older writings ou historical and compiled from order writings of instorted and miscellaneous subjects. The most ancient manu-scripts in Ireland containing original matter in the Irish language are the Book of Armayh (9th c.) and the Book of Hymns, of a somewhat later date, both ecclesiastical in their contents. The writings extant in the Gaelic language of Ircland consist of ecclesiastical documents, laws, bardic or semi-historic tales, historic tracts, genealogies, historic poems, treatises on medicine, translations from foreign authors, proverhs, compilations of the 17th o., popular poetry, political and satirical poems and songs, composed by native Gaelic writers in Ireland within the last century. Of the ecclesiastical documents, the next in importance, after the Book of Armagh and the Book of Hymns, are the metrical Festologies of Ængus Ceile rygins, are the metrical restorogies of Aragus Cente De (9th c.), the Martyrology of Tallaght (10th c.), and that of Marianus O'Gorman (12th c.). In this department there are also extant many lives of eaints, monastic rules, devotional and religious comes. A large belief of all this invitamentary poems. A large body of old Irish jurisprudence, known as the *Brehon Laws*, is preserved in manuscripts of the 14th and 15th centuries. Of the Irish bardic or semi-historic tales, numbers are extant ranging in date from the 12th to the 18th century. The principal Irish historic tracts are those on the tribute styled Borumha, the wars of the Danes with the Irish, and the wars of Thomond. Copious genealogies of the principal native families exist in various manuscripts, and from such sources MacFirbis, a learned Irish antiquary of the 17th c., made an rearrest trish antiquary of the 17th C., made an elaborate compilation known as Leabhar Genealach, or the 'Genealogical Book,' now considered a high authority. The chief composers of poems on the history of Ireland were Ecchadh O'Flin (10th c.), Gilla Caemhain, and Flan of Monasterboice (11th century). The most important ancient Irish annals are those of Tighernach, of Ulster, of Inisfallen, and of Connacht.

The Irish manuscripts on medicine contain original treatises by native physicians of the 14th and 15th centuries, with commentaries on the then known medical authors of Europe and the East. The lrish translations from foreign languages are chiefly versions of medieval Latin and continental books-historic, scientific, romantic, and religious. of original adages and proverbial senteness, great numbers exist, of various ages. The privileges enjoyed by the Irish peets under the clan system enabled them to devote themselves to the production of elaborate metrical compositions, many of unit of the poet Spenser. During the wars and george's Channel (q. v.), separates the north of St. graphs Elizabeth, the bards were energetic in Ireland from the central districts of the United

stimulating the chiefs to whom they were attached. The merit of the elegiac poem on the deaths of the Earls of Tirone and Tirconnell by their bard Mac an Bhaird, who accompanied them in exile (1608 A.D.), attracted the attention of the critical Lord Jeffrey, who became acquainted with it through Mangan's English version in the metre of the original. Among the native writers in Ircland the original. Among the native writers in recand after the establishment of the English dominion, in the reign of James I., was Dr Geoffrey Keating, compiler of a history of Ireland in the Gaelie lan-guage, and author of religious treatises and poems. About the same period, historical and hagiographical compilations were made by the O'Clerighs, the most important of which was that styled the *Annals* of the Kingdom by the Four Masters, extending from the earliest period to 1616 A.D., edited in from the earliest period to 10 to 2. D., culted in seven large volumes (Dublin, 1848), with an English version and copious notes, by the late Dr John O'Donovan, the ablest of Irish scholars. The Gaelic continued to be the language of the native rural population of Ireland during the 17th and 18th centuries, and many religious and romantic pieces were composed in it for popular use. Differing from the English settlers in religious and political sentiments, the native Irish found gratification in satiris-ing and ridiculing them in the Gaelic language, in which they composed numerous songs in favour of the Stuarts, and denunciatory of the Hanoverians and their adherents. Members of old Irish families who attained high distinction in military service on the continent, retained with pride the Gaeho tongue; it was also commonly spoken by the soldiers in the Irish Brigades in France, and in the American army during the War of Independence. Various attempts were made since the middle of the last c. to print Gaelie documents, but the critical knowledge of the language in its archaic forms having fallen into abeyance, such publications proved entirely unsatisfactory, until the subject was taken up about 1830 by government, during the progress of the Ordnance Survey of Ireland. From this may be said to date the true Irish school of accurate historic and linguistic learning, which has since produced many valuable volumes, under the superintendence of the Antiquarian section of the Royal Irish Academy and the Irish Archeological and Celtic Society. On the works issued by these two boties, which for many years have included nearly all the most crudite scholars of Ireland, philological and historic students must now depend, as other publications on these subjects are, with few exceptions, illusory and misleading.

The Irish, in its modern forms, is still spoken commonly by the rural classes and native land-owners in Connaught, Munster, the remote parts of Ulster, the south of Leinster, as well as in the islands off the western coast of Ireland. The provincial dialects vary considerably in words, pronunciation, and idioms. The Irish emigrants have carried their language across the Atlantic, and songs and poems in the Irish language and character occasionally appear in American newspapers. Professorships of the Irish language exist in Trinity College, Dublin; in the Queen's Colleges at Belfast, Cork, and Dublin; in the Queen's Coneges at Bellast, Cork, and Galway; and in the Roman Catholic College at Maynooth. The chief collections of Irish manu-scripts are these of the Royal Irish Academy and Trinity College, Dublin; numbers are also preserved in the British Museum, in the Bodleian, and in some private libraries.

IRISH MOSS. See CARRAGEEN.

Kingdom. Between the coasts of Louth and Lanleagth between St George's Channel on the south and the North Channel on the north is also about 120

IRITIS is the term applied to inflammation of the Iris. See Eve. The cavity across which the iris is stretched, and the iris itself, which projects into that cavity, and divides it into an anterior and a posterior chamber, are lined or invested by a membrane which resembles the larger serous membranes of the body, such as the pleura, peritoneum, &c., and consequently the inflamination of this membrane is of the adhesive kind. See Inflam-MATION. When it is added that the effusion of lymph may limit or entirely stop the movements of the iris, and may alter the form, or even close up the aperture of the pupil, the serious nature of the disease will be at once perceived.

The objective symptoms of iritis (those which can be observed by the physician) are: 1. Redness of the eye, arising from vascularity of the sclerotic; 2. Change in the colour of the iris. When lymph eye is rendered yellowish or greenish, while in a dark eye a reddish tint is produced. The brilliancy of the colour of the iris also disappears. When the inflammation is very violent, or has been unchecked by remedies, suppuration may take place. 3. Irregularity, and sometimes immobility of the pupil, produced by the adhesion of the back of the iris to the crystalline lens. The subjective symptoms (those of which the patient alone is conscious) are intolerance of light, dimaess of vision, and pain in and

around the eye.

The causes of iritis are various. The disease may arise from actual injury in surgical operations performed on the eye; from over-exertion, and too prolonged continuous use of the eye (thus, it is common among needlewomen, engravers, and watchmakers); or from some constitutional taint,

especially syphilis, gout, rheumatism, and scrofula. The treatment of iritis varies to some extent according to the cause which induces it, but the great remedies are three. 1. Blood-letting, for the purpose of moderating the febrile disturbance, and of facilitating the operation of the second remedy, which is, 2. Mercury, which used to be given in large doses (such as two, three, or four grains, with a little opium, every four or six hours), but which is preferably given in small doses, such as two or three grains of hydrarg, c. creta, with a little hyoscyamus, two or three times in the twenty-four This dose should be lessened as soon as the hours. mouth begins to be tender, and by that time the lymph will be found to break up, and leave the pupil clear. 3. Belladonna. The pupil should be kept well dilated by the application of the extract of belladonna to the skin round the eye, or, far better, by the instillation into the eye of a weak solution of sulphate of atropine, with the view of preventing adhesion of the iris, or of breaking, or, at all events, of stretching and elongating any adhesive bands that may be formed; and thus of preventing any impairment of the movements of the iris, and any irregularity of the pupil, after the inflammation

IRKUTSK, capital of the Russian government of that name, is the residence of the governorgeneral of Eastern Siberia, and the seat of a bishop. It is situated on the right bank of the Angara, near its confluence with the river Irkut, in

enjoys a very healthy climate, though in winter the cold is so severe as to freeze mercury. The streets are straight and wide, but ill-payed, and the houses mostly built of timber. The best buildings are the palace of the governor-general, the schools for boys and girls, and the hall of the American Company. Besides these, the town contains a public library, a museum of natural history, and some other public institutions. The population in 1863 was 28,009, consisting mostly of Russians and Buriats. I. was founded in 1661 by a Cossack chief named Iwan Pochapof, and, owing to its position on the great thoroughfare between Eastern and Western Siberia, between China and Russia, it soon became the commercial centre of Siberia, especially for the tea-trade. The current of the Angara is so rapid that the strongest frosts cover it but seldom with ice. Nevertheless, it is navigable, and constitutes the mainway for the goods bound for Kiachta by means of Lake Baikal, as well as for those coming from Eastern Siberia, Russian America, and China to Irkutsk. The former are chiefly furs and metals; the latter, tea, meat, and fish from Lake Baikal. The communications between I. and Jakutsk, and the other northern towns of Siberia, are carried on by the river Lena. The manufactures of I. are purely local, and supply the half-nomad Buriats and Tunguses, inhabiting the adjacent country.

IRKUTSK, a government of Eastern Siberia, bounded by the government of Jeniseisk, the province of Jakutsk and the Chinese Empire, occupies an area of 267,555 square miles. The soil is partly fertile, partly hilly and marshy; the climate in general severe. The Baikal and Ner-chinsk Mountains, with their numerous branches, give the country a high alpine character; besides these, the Salan range extends along the southern borders, and the Jablonovy or Apple range along borders, and the Janonovy of Apple range among the castern. The principal rivers are the Lena, Shilka, Agán; the largest lake is the Baikal (q. v.). The productions of the country are rye, wheat, barley, oats, rhularh, hops; reinder, sables, ermines, foxes, scals; fish—sturgeon, cod, silure; minerals-gold, silver, lead, jasper, amethysts, topazes, emeralds, yellow amber, rock-salt, and coal. The population of the government in 1863 was 365,810, and consists of Buriats, Tunguses, and Russians. The inhabitants are for the most part employed in agriculture, and to some extent in fishing and hunting. As a local industry, the manufacturing of an excellent oil out of stone-pine nuts deserves notice. The foreign commerce consists in the trade with China, carried on through Troitzko-Savsk and Kiachta (q. v.), and has risen to great importance in recent times.

The government of I. is divided into two districts-Irkutsk and Kircusk-and the township of Kiachta. The capital is Irkutsk; the other towns are Telma, with a cloth-factory, Troitzko-Savsk, Kiachta, Kirensk on the Lena, Nijnendinsk, and

Verkholensk.

IRON (sym. Fe [Lat. ferrum], eq. 28, sp. gr. 7.844) occurs more abundantly than any other metal. In its native form it is chiefly found in meteoric stones (see AEROLITES), and in certain ores of platinum, and is consequently of comparatively rare occurrence, but the so-called iron ores -the oxides, sulphides, &c. - are very widely distributed. The most important of these ores are mentioned below,

Pure iron may be obtained by the ordinary method described below, and also by reducing the Angara, near its confinence with the first its state.

In a first its confinence with the first its state. The first its state in the form of a fine black powder, about 1200 feet above the level of the sca, and it is obtained in the form of a fine black powder, about 1200 feet above the level of the sca, and it is obtained in the form of a fine black powder, about 1200 feet above the level of the sca, and it is obtained in the form of a fine black powder, about 1200 feet above the level of the sca, and it is obtained in the form of a fine black powder, about 1200 feet above the level of the sca, and it is obtained in the form of a fine black powder. or by heating the protochloride in a glass tube through which a current of dry hydrogen is passed. In this case, pure iron is deposited as a glistening mirror on the glass.

This important metal will be most conveniently

considered under the three heads of

I. Chemistry of Iron.—Chemically pure iron is of so little general interest that we shall confine our remarks on the properties of this metal to those which are exhibited by bar or wrought iron. Its colour is gray or bluish-white; it is hard and lustrous, takes a high polish, is fibrous in texture, and when broken across, exhibits a ragged fracture. It requires a very intense heat for its fusion, but Trequires a very means near for its motion, one before melting passes into a soft pasty condition, in which state two pieces of iron may, by being hammered together, be united or welded so completely as to form, to all intents and purposes, a single portion. At a red heat, it may be readily forged into any shape; but at ordinary temperatures it possesses very little mallcability, as compared with to possesses very native manearomity, as compared with gold and silver. In ductility, it stands very high, being barely exceeded by gold, silver, and platinum; and in tenacity, it is only exceeded by cobalt and nickel. Its susceptibility to magnetism is one of its most remarkable characteristics. See Magnetism. At a high temperature, it burns readily, as may be seeu at the forge, or (more strikingly) when a glowing wire is introduced into a jar of oxygen. In dry air and at ordinary temperatures, the lustrous surface of the metal remains unchanged; but in a moist atmosphere the surface rapidly becomes oxidised and covered with rust, which consists mainly of the hydrated oxide of iron. At a red heat, iron decomposes water, and liberates hydrogen, the oxygen combining with the iron to form the black or magnetic oxide (Fe₃O₂), which occurs in minute crystals. This is one of the ordinary methods of obtaining hydrogen.

The affinities of iron for most of the non-metallic elements are very powerful. The chief of the iron

compounds are

a. Oxides of Iron,-Iron forms two oxides with oxygen, viz., the protoxide or ferrous oxide (Fe2O) the sesquioxide or ferric oxide (Fe4O3), and several oxides of intermediate composition, called ferrosoferric oxides, which may be regarded as compounds of the two before mentioned. The most important of these is the magnetic oxide (Fe₆O₄ = Fe₂O₄Fe₄O₃). Ferrous oxide is the base of the green salts of iron, and is very readily oxidised into the brown ferric oxide. Ferric oxide occurs in nature very abundantly, and is a source of much of our iron product. It forms salts known as ferrates.

The most important protosalts of iron, or ferrous salts, are the carbonate, the sulphate, the phosphate,

and the silicate.

Carbonate of iron (Fe2CO3) exists naturally in various minerals, and may be obtained artificially by preous finited as a soluble protosalt of iron with carbonate of potash or soda, when the carbonate falls in white flakes. On exposure to the air, it absorbs oxygen, and gives off carbonie acid, and is thus converted into and gives of carbonic acta, and a barbonic acta the hydrate ferrous sulplined or protoxulphate of iron (Fe₂SO₄,7H₂O) is obtained by the solution of iron, or its sulphide, in dilute sulphuric acid; in the former case, there is an evolution of hydrogen, and in the latter of sulphuretted hydrogen or sulphydric acid. The reactions in the two cases are expressed by the equations,

 $Fe_2 + H_2SO_4 = Fe_2SO_4 + H_2$ $Fe_2S + H_2SO_4 = Fe_2SO_4 + H_2S$.

On evaporation of the solution, the salt is obtained in clear bluish-green rhomboidal crystals, containing seven atoms of water. This salt is commercially

known as copperas or green vitriol, and its various applications in technology are noticed in the article VITRIOLS, BLUE AND GREEN.

Ferrous, ferric, and ferroso-ferric phosphates exist, some of which are produced by art; others are found abundantly in nature. Bog iron ore and many coprolites contain ferric phosphate.

All these salts, especially the carbonate and sulphate, are extensively used in medicine.

Silicate and phosphate of iron occur naturally in several minerals.

The peroxide of iron, termed also sesquioxide, red oxide, or ferric oxide, is obtained in an anhydrous form by igniting the protosulpbate, and is known in the arts under the names Colcothar, Crocus of Mars, or Rouge, according to the degree of levigation to or Ringe, according to the degree of revigation to which it has been submitted. It is employed for polishing glass, jewellery, &c., and is also used as a pigment. It occurs both in the anhydrous and in the hydrated form in various minerals

The hydrated peroxide (Fe4O3,2H2O) is obtained by precipitating a solution of a persalt of iron or of a ferric salt, with an excess of potash, ammonia, or alkaline carbonate. It falls as a yellowish-brown flocculent precipitate, which when dried forms a dense brown mass. This hydrated peroxide of iron, when freshly prepared and suspended in water, is regarded as an autidote in arsenical poisoning. Rust, as has been already mentioned, is a hydrated peroxide, com-

bined with a little ammonia,

The most important of the persalts of iron, or ferric salts, are the neutral and the basic sulphate, whose formulæ are Fe₂O₅,3SO₅ and Fe₂O₅,2SO₃, respectively, the nitrate (Fe₄O₅,3N₂O₅,18H₂O), the phosphate, and Of these, the neutral sulphate, the phosthe silicate. phate, and the silicate occur in various minerals. nitrate, which is obtained by the solution of iron in nitric acid, is a useful medicinal agent.

The black or magnetic oxide (FesO4) occurs abondantly as a natural mineral, and is one of the richest

ores of iron.

Trioxide of iron or Ferric anhydride (Fe2O3) is not

known in the free state.

b. Haloid salts of iron-the chlorides, bromides, and iodides-next require notice. There are two chlorides—viz., a protochloride (FeCl) and a perchloride or sesquichloride (Fe₂Cl₃). The latter may be obtained by dissolving peroxide of iron in hydrochloric acid. The tincture of the sesquichloride of iron is perhaps more generally employed in medicine than any other preparation of this metal. The protiodide is esteemed a valuable therapeutic agent.

c. There are several ferrous sulphides or sulphurets of iron. The ordinary sulphide is a protosulphide (Fe₂S). It occurs in small quantity in meteoric iron. It may be obtained artificially by the direct union of the two elements at a high temperature, or by the precipitation of a protosalt of iron by sulphide of ammonium. It exists in glistening masses, varying in colour from a grayish-yellow to a reddish-brown. It is insoluble in water, but in moist air becomes rapidly oxidised into protosulphate of iron. With acids, it develops sulphuretted hydrogen. The di-sulphide of iron (Fe₂S₂) is the iron pyrites of mineralogists, and the mundic of commerce. Under the latter name, it is used extensively in the preparation of the oil of vitriol. There are also other sulphides of less import-

The protosalts and the persalts, or the ferrous and the ferric salts, give totally different reactions with the ordinary tests. The solutions of the former have a greenish colour and a peculiar metallic taste, while those of the latter are generally of a brownishyellow colour, and are very acid. Sulphnretted hydrogen gives no precipitate with an acid solution of a ferrous salt, while it gives a milky precipitate

of sulphur with a solution of a ferric salt. Potash, soda, sud ammonia throw down a white hydrated oxide from the former, and a brown hydrated peroxide from the latter. Ferroevanide of potasperoxide from the latter. Ferro-yamide of potas-sium gives with ferrous salts a white precipitate, which soon becomes blue, while with ferric salts it at once produces a blue precipitate, even in a very dilute solution. Tincture of galls (tannic acid) produces no immediate change of colour with the ferrous, but a deep blackish-blue colonr (ink) with the ferric salts. Sulphocyaoide of potassium produces no change with the ferrous, but gives a deep blood-red tint with the ferric salts. Succinate and benzoate of ammonia produce no precipitate or change of colour with the former, while with the latter, if the solution is not too acid, they throw down pale reddish-brown precipitates.

2. Manufacture of Iron.-The increasing use of iron is a prominent characteristic of the present age. Every day sees some new application of it in the arts of life. Although the most useful of the metals, it was not the first known. The difficulty of reducing it from its ores would naturally make it a later acquisition than Gold, Silver, and Copper (q. v.). See also BRONZE, and BRONZE PERIOD. The reduction of the ore known as the black exide of iron, however, has been carried on in India from

the earliest times.

In Europe, the rich specular and other ores of Spain and Elba were much used during the Roman period; in Greece, also, irou was known, though, as among the Romans, its use was subsequent to that of bronze. We are informed, too, by the Roman historians that this metal was employed by the ancient Britons for the manufacture of spears and lances. The Romans, during their occupation of Britain, manufactured iron to a considerable extent, as is evidenced by the cinder-heaps in the Forest of Dean and other places. The rude processes then in use left so much iron in the cinders, that those of Dean Forest furnished the chief supply of ore to twenty furnaces for between 200 and 300 years. In those early times, the irou ores were reduced in a simple conical furnace, called an air-bloomery, erected on the top of a hill, in order to obtain the greatest blast of wind. The furnaces were subsequently enlarged, and supplied with an artificial blast. Charcoal was the only fuel used in smelting till 1618, when Lord Dudley introduced coal for this purpose; but the iron-masters being unanimously opposed to the change, Dudley's improvement died with himself. It was not reintroduced till Abraham Derby, in 1713, employed it in his furnace at Coalbrook Dale. But as this method was not properly understood, the production of English iron declined with the change of fuel, till, in 1740, it was only threefourths of what it had formerly been. About ten years after this, however, the introduction of coke gave renewed vigour to the iron-trade, and then followed in rapid succession those great improvements in the manufacture which have given to the history of iron the interest of a romance. The introduction of Watt's steam-engine in 1770, the processes of puddling and rolling invented by Henry Cort io 1784, and the employment of the hot-blast by Neilson of Glasgow in 1830, have each been of inestimable service. So recently as 1856, Mr Henry Bessemer patented a process (see Bessener's Pro-('Ess) for the production of malleable iron and steel, which has already proved eminently vuluable, and is esteemed one of the greatest improvements ever introduced into the iron manufacture,

The great supply of iron is derived from its numerous ores, which are abundantly distributed over the globe; the chief of which are -1. H:enns-

or brown iron ore; 3. Magnetic, or black iron ore; 4. Ironstone, blackband, or clay iron ore; 5. Bog iron ore, or phosphate of iron.

The ore richest in the metal is the magnetic (see MAGNETISM), or black oxide of iron. When pure, it contains nothing but oxygen and iron, its chemical formula being Fe₂O₄, which gives 73 per cent of iron by weight. It occurs in dark heavy masses or black crystals, and is found in the older primary rocks. Sweden is famous for this ore, and for the iron produced from it, which is esteemed the best in Europe. The celebrated mines of Dannemora, in that country, have been constantly worked since the 15th century. Russia, too, has great iron works in the Ural Mountains, which are supplied with this ore. It occurs in vast beds in the Eozoic of the Adirondack region in Northern New York; also at Franconia, N. H., at Franklin, N. Jersey, Goshen, in Penna., and in Sierra eo., California. No ore of iron is more generally diffused than the magnetic, and none superior for the manufacture of iron. It is easily distinguished by its being attracted readily by the magnet, and by the black colour of its streak and powder,

The red oxide differs from the last only in containing proportionally a little more oxygen, its formula being Fe₄O₅, that is to say, 70 per cent. of iron by weight. There are several varieties of this ore, but only two need be referred to. The first of these, specular iron, so called from its bright metallic lustre, occurs in large crystalline masses in the island of Elba. where it has been worked for more than 2000 years, It abounds also in Marquette, L. Superior, and the Iron Mt., Missouri. From the former nearly 3,000,-000 tons of iron have been made. The other variety is red hamatite, an ore whose origin is still a curious problem, as its deposits occur sometimes in veins, and sometimes in apparently regular beds. Its characteristic form is in large kidney-shaped nodules, with a fine radiated structure. This shape, however, is only assumed in the cavities of massive deposits. Red hæmatite is sometimes called bloodstone. It is used for polishing metals, and yields a blood-red powder, used as a pigment. This valuable iron ore is found in many countries, but perhaps nowhere in greater abundance than at Whitehayen and Ulverstone, in the north-west of England, where splendid masses of it occur, 15, 30, and even 60 feet in thickness. These two districts produced, in 1861, about 1,000,000 tons of hæmatite

Brown hamatite is a hydrated peroxide of iron, and has the same composition as red hæmatite, except that it contains a certain proportion of water. It is generally found massive, more rarely crystalline, and a variety, occurring in small ronuded nodules, is called pea iron ore. When mixed with earth or clay, it forms yellow ochre and brown umber, so largely used as pigments, but the latter also contains manganese. Limonite, of which brown hæmatite is a variety, is one of the most important ores of iron, Extensive beds ocenr in N. England, N. York, and Pennsylvania to Alabama.

Bog iron ore is a mixture of brown hematit and phosphate of iron, occurring in marshy districts of recent formation. This ore is also extensively smelted in France.

There is a sparry carbonate of iron, termed spathose iron ore, of considerable importance on the continent of Europe, especially in Prussia, where extensive deposits of it exist. It is of a yellowishgray colour, very much resembles the common mineral cale-spar, and yields from 40 to 50 per cent. of iron. It is much used for the manufacture of steel.

tite, specular, or red iron ore; 2. Brown hematite, of their crystalline forms, a certain attraction for

the cabinet of the mineralogist. But there remains to be noticed a dull, blackish or clay-coloured mineral, possessing no beauty or symmetry, which Great Britain prizes as one of the greatest of her mineral treasures : this is the ironstone of the coalmeasures, which is variously named clay iron ore, clay carbonate of iron, and blackband. It is essentially a mixture of carbonate of iron with clay, containing also water, and in the case of blackband, coaly or bitaminous matter. It is estimated that the coal-measures of Great Britain produce about nine-tenths of her iron; and it is a fortunate thing that, along with the ore, are found both the fuel and the limestone that are indispensable for its reduction.

About ten years ago, the three great iron districts of Britain were South Staffordshire, South Wales, of Britain were South Countries of State of Stat exhausted, its produce having diminished about a half, while that of the South Wales and Scottish districts have increased, and they are now yielding nearly a million tons each. North Staffordshire, nearly a million tons each. North Statiorishire, Shropshire, Derbyshire, and the West Riding of Yorkshire are the principal remaining districts yielding ores of this class, but their total produce is not more than that of South Staffordshire, although the iron of the West Riding is the best in

Britain as regards quality.

There is yet another great iron district, yielding an ore belonging to a more recent formation than the carboniferous beds-namely, the lias. deposit, which twenty-five years ago was unknown, is now producing iron to the enormous amount of 1,500,000 tons per annum. It is the ironstone of the Cleveland Hills, in the north-east of Yorkshire, which, from its resemblance to common sandstone, passed unnoticed till 1847. About that time, isolated blocks of it, found on the sea-coast, were discovered to contain about 30 per cent. of iron. On further examination of the district, these were proved to be detached pieces of a massive bel, no less than 15 feet thick, which could be traced for many miles along the sides of the hills. Some idea of the value of this vast deposit of iron ore will be found in the fact, that the ironstone seams of the coal-measures seldom exceed 20, and are worked as low as 8 inches in thickness. Another mass of ironstone of great thickness, also belonging to the lias beds, has very recently been discovered in North Lincolnshire. In the colite, too, beds of brown iron ore have been discovered in several counties, but chiefly in Northamptonshire, where it has been worked with so much spirit, that from 150,000 to 200,000 tons of ore per annum have been raised.

To those remarkable discoveries may be added that by Mr Rogers of Abercarn, who, after exam-ining the position of the pisolitic ore at the base of the carboniferous limestone in Belgium, searched the corresponding strata in South Wales, and curiously enough was rewarded with the discovery of a precisely similar bed at Cwm Noddi. The same gentleman, struck by the appearance of the sparry carbonates of iron in the Austrian and Prussian departments of the Exhibition of 1851, soon afterwards noticed voins of a like ore in the Devonian rocks of Somersetshire. In fact, the sources which have been discovered within the last twenty-five years are already yielding a larger supply of iron than the total produce of any other European country except

the Memoirs of the Geological Survey, and the second is by Dr Murray Thomson.

It will be noticed that in the case of these ores the impurities are rather numerous. Nevertheless, the modes of preparing and smelting them are some-what rude and simple, as the low price of iron will not permit of its ores being treated with the same care as the ores of lead, copper, tin, and some other

Iron ore is still reduced in the south of Europe by the old and imperfect process of the Catalan force, not unlike a common smith's forge. In Great -Britain, however, as well as in all other countries where iron is largely smelted, the blast-furnace is now universally employed, by means of which the metal is obtained in the state of crude or cast iron. For the finer kinds of iron, charcoal is the fuel employed, because, unlike coal or coke, it contains no sulphuret of iron or other injurious ingredients. The Russian and Swedish furnaces smelt with charcoal, and on this, as much as on their pure ores, depends the high reputation of their iron. A solitary charcoal-furnace at Ulverstone in England, and another at Lorn in Scotland, were working in 1864 the only relics of times past, when this was the only fuel employed.

As a preliminary process to the actual smelting in the blast-furnace, clay and blackband ironstones are generally roasted. This is accomplished by breaking the ore into small pieces, spreading it in open heaps on the ground, and mingling it more or less with small coal according to the nature of the ore. Blackband commonly contains enough of carbonaceous matter to burn without the addition of coal. The pile, which may contain from one to several thousand tons of ore, is lighted at the windward end, and burns gradually along, aided by occasional fires in the sides, till the whole heap has undergone calcination, the time required for this purpose being generally about a month. Sometimes the operation of roasting is performed in close kilns, instead of open heaps, a mode by which the ore is France.

Considerall to be more uniformly reasted, and with Ecfore proceeding to describe the mannfacture of considerably less fuel. By calcination, clay iron-tron, we give two analyses of British ores; the first stone loses from 25 to 30, and blackband from 40. is by Mr. J. Spiller, taken from a series published in to 50 per cent, of its weight, the loss consisting

chiefly of carbonic acid and water. When roasted. the ore contains about 10 per cent, more of iron than it does in its raw state; and, moreover, it is reduced to the state of black oxide of iron and clay.

It is now ready to be smelted.

The blast-furnace is generally built in the form of a truncated cone, with a massive square base. Internally, it is either barrel-shaped or in the form of a double cone, like two flower-pots placed mouth to month. The inside requires to be built of the most refractory firebrick. The external portion is most refractory firebrick. either of common brick or stone, seenred with iron binders; without this, the great heat would soon displace the most substantial brickwork. A good-

the base, and is 50 or 60 feet in height. Three sides of the base have arched recesses for the pipes conveying the blast, and on the fourth there is a similar recess, in which are the openings for running off the metal and slag.

Fig. 1 is a sectional view of a hot blast-furnace, with the blowing engine and other appliances, which is taken, with some modification, from Mr Fairbairn's work on Iron. It may be well to state here that one engine usually supplies the blast to several furnaces. A is the body of furnace; B, the hearth, above which are placed the tuyeres, C; D is the tunnel-head, around which there is a gangway, for the workmen to have access to the feeding-doors sized blast-furnace measures about 30 feet across at E. The blowing-engine is shewn at F. Air is

Fig. 1.-Hot Blast-furnace,

forced into the furnace by means of the blowing cylinder, G, from which it passes into the receiver, H, and thence along a pipe into the heating-oven, I. Here a large surface of pipe is exposed, in archshaped rows, to the fire, which heats the enclosed air to 600° F. and upwards-a heat sufficient to melt lead. At this temperature, it enters the lower part of the furnace by means of the tuyeres, C. From 5000 to 10,000 cubic feet of air is discharged

into the furnace per minute.

The operation of smelting is thus performed: the roasted ore, coal, and lime (flux) are either hoisted, or, if the nature of the ground permits, moved along a platform or gangway to the gallery near the top the furnace, and fed into it at intervals through the openings in the side. We may here state that the furnace is kept continually burning except when under repair. The materials are of course raised to a very high heat, and gradually fuse into a softened mass. The clay of the ironstone then unites with the lime to form a coarse glass, or slag; the oxide of iron at the same time gives up its oxygen to the fuel, and allows the metal itself to collect on the hearth at the bottom of the furnace, united with about 5 per cent. of carbon, which it takes from the fuel, forming the variety called east iron. Every twelve, and sometimes every eight hours, the metal is run off from the furnace, by means of a tap-hole at the bottom of the hearth, into rows of parallel moulds, called pigs, which are formed in sand, hence the name 'pig iron.' The slag which floats on the melted iron is run off by an opening at the top of the hearth. If the furnace

is working well, the slag should be of a light-gray colour; a dark-brown or black colour shews that

too much iron is passing into it.

The quantity of materials necessary to yield a ton of pig iron may be taken roundly as follows: 2 tons of calcined ironstone; 2 tons of coal, of which about 8 cwts. are required for the blowing-engine and hot air pipes; and from 12 to 16 cwts, of broken limestone. The weekly produce of a single blast-furnace varies extremely—50, 100, and even the enormous quantity of 600 tons, is now occasionally obtained. The last amount, however, can only be procured from hæmatite orc.

There are about six varieties of cast iron, but it will be sufficient to describe three of them. No. 1 has a large and clear grain, is of a dark-gray colour, and contains its carbon for the most part mechanically diffused through its substance. It brings the highest price, is very fusible, and therefore largely used for castings, especially for those of a line description. No. 4 has a much closer grain, is of a description. No 4 has a future of the light, though dull gray colour, and contains its carbon partly diffused through it and partly in chemical combination. It is generally employed for conversion into malleable iron. No. 6 is called white or silvery iron, and has all its carbon chemi-eally combined with the metal. It is not in much request, being usually produced when the furnaces are working badly. The qualities of the intermediate numbers differ only in degree from those described; thus, No. 2 is rather less gray, crystalline, and fusible than No. 1, and so on.

The hot-blast process which has been described

above, was introduced, in 1830, by Mr James B. Neilson, of Glasgow, and has been productive of very remarkable effects on the iron trade. whole invention consists in simply heating the air blown into the furnace, and yet the saving of fuel by this is about one balf, and the production of iron, since it came into use, has increased at least four-fold. The 'cold blast' is still, however, to a limited extent employed, and produces the strongest iron, though necessarily at a much higher cost. The difference in quality appears to be caused by the greater heat in the case of the hot blast facilitating the passage of impurities into the iron.

We pass now to the consideration of malleable or wrought iron. It differs from cast iron in containing no carbon. The great object in the processes adopted for the conversion of cast into malleable iron, accordingly, is to deprive the former of its carbon. But it is also very desirable to get rid of deleterious ingredients, such as sulphur and phosphorus, which are generally present in minute quantities in the cast iron. The ordinary processes for the manufacture of malleable iron are refining, puddling, shingling or hammering, and rolling. The refinery is shewn in section in fig. 2. It consists of a flat hearth, A, covered with sand or loam, and surrounded with metal troughs, B, through which a stream of water is constantly flowing, to keep the

Fig. 2.-Refinery.

sides from melting. C are the tuyeres in connection with the blowing-engine. The cast iron is melted with coke on the hearth, and a blast of air kept blowing over it, which causes its carbon to unite with the oxygen of the air, and pass off as carbonic oxide gas. Oxygen also unites with silicon to form silica, and with iron to form the oxide. The silica of the sand uniting with oxide of iron, produces a slag of silicate of iron. The refined metal is finally run out in cakes on a bed of cast iron, kept cool by a stream of water. Being only partially decar-bonised by this process, it is next broken up for the puddling furnace. About 10 per cent. of iron is lost in the refinery.

Fig. 3 shews a puddling furnace in longitudinal action. A represents the hearth; F, the grate or fireplace; and C, the chimney, which has a damper at the summit, to regulate the draught. The grate is separated from the hearth by means of a bridge, D, which presents the size of the second which prevents the direct contact of the fuel with the iron. In the operation of puddling, about four cwts. of refined iron are placed on the hearth, and the heat raised till it is melted; the metal is then thoroughly stirred with an iron rod, so as to is flowing over its surface. In this way, the carbon and other impurities are burned off, the fusibility of the iron is diminished, and ultimately it becomes

Fig. 3.—Puddling Furnace.

a spongy, granular mass. The whole charge of the furnace is now divided and formed into 'balls,' weighing from 80 to 110 lhs. each, which are then raised to a welding heat, and taken singly to be shineled.

Instead of being both refined and puddled, pig iron is now largely decarbonised by means of the single process of 'boiling.' By this method, which is very similar to puddling, gray pig iron is deprived of nearly the whole of its carbon in the puddling furnace. In this way the metal requires to be raised to a higher heat and more frequently stirred than in ordinary puddling, so as to expedite the escape of the larger amount of carbon; which has the effect of causing the metal to boil or bubble as the gases become disengaged. The boiling process requires about 24 cwts. of pig to produce a ton of bar iron, while the two processes of refining and puddling require 26 cwts. or thereby for a ton of similar bar iron. There is therefore least loss when the single operation of boiling is adopted, but, on the other hand, with it there is more tear and wear of the furnaces, and also more manual labour required.

The process immediately following the puddling or boiling is called 'shingling,' and consists in hammering the puddled balls with either the helve or steam-hammer, or in passing them through a squeezer till they are sufficiently consolidated, and the greater part of the cinders forced out. Fig. 4 represents Mr Nasmyth's steam-hammer (see Hammer), which is now largely used in shingling as well as in heavy forgings. Puddled balls which have undergone shingling are called slabs or blooms. These are next passed through heavy rollers termed 'forge' or 'puddle-bar rolls,' and reduced to the form of a flat bar. For all the better kinds of iron, the bars thus treated are cut into short lengths, piled together, reheated in a furnace, and again passed through the forge rolls. Once more the iron is cut, piled, and heated, and then passed through the 'mill-train,' consisting of what are termed the 'bolting' or 'rough rolls,' and finally through the 'finishing rolls,' Both these sets of rolls in the case of plates and sheets are plain, but in the case of bars are grooved, so as to form them into the required are grooved, so as to form them in the sate rained shape, such as flat, square, round, octagonal, or T-shaped iron. Fig. 5 indicates the arrangement and appearance of the 'rough' and 'finishing rolls' of a bar mill-train.

There is still another important variety of iron, viz., Steel, the manufacture of which remains to be described. Steel is essentially iron containing from 1 to 11 per cent. of carbon. Remembering that cast iron contains some 5 per cent. of carbon, the unini-tiated reader will be a little astonished to learn that, in this country at least, most of the steel is expose fresh surfaces to the oxygen of the air which made from malleable iron, seeing that, at some stage of the conversion of cast into wrought iron, the ing malleable iron into steel is called cementation metal must have passed into the condition of steel. See BLEYERED STEEL

Fig. 4.-Steam-hammer.

As blistered steel is full of cavities, it is necessary to especially for the finer purposes to which steel is applied, one method, it is converted into what is called 'shear steel.'
This is done by breaking the bars of blister steel into short lengths, heating them in bundles, and partially welding with a forge-hammer. The rod so formed is heated again, and now brought under the action of the tilt-hammer-a heavy mass of metal weighing nearly 2 cwts. Here, by a succession of blows, it is formed into bars, which are much more compact and malleable than blister steel, and consequently better fitted for edge-tools and the like. Sometimes this kind is called tilted steel. By another method, viz., that of melting the blister steel in fireclay crucibles, and casting it into ingots, 'Cast Steel' (q. v.) is made. This is the best kind of steel, being finely granular, homogeneous, dense, and well adapted for the finest cutting instruments.

There are other modes of manufacturing steel, such as by the partial decarbonisation of cast iron on a charcoal hearth, a method largely prac-

tised on the continent, Bessemer's method of producing malleable iron directly from crude pig iron is described elsewhere. See Bessemen's elsewhere. See Bessemer's Process. Malleable iron made by Mr Bessemer's process is apt to be cellular and unsound, defects which the inventor has had great trouble in over-coming, if even now he has thoroughly succeeded. According to the same process, steel

is made by introducing into the

Nevertheless, our manufacturers have hitherto melted iron a given quantity of spiegeleisen (a peculiar thought it best to take the whole of the carbon out kind of cast iron), containing a known percentage of the cast iron, and then restore a certain portion of carbon; and so steed may be produced with any by heating with clarcoal. This process of convert-required proportion of carbon. The spiegeleisen

Fig. 5.-Rough and Finishing Rolls,

dissolves in the iron like sugar in water, rendering | tunately, when pig iron containing phosphorus is the metal more fusible and very liquid. Unfor-

not separated in a sensible degree, as is the case in the process of puddling; so that only those varieties of iron which are free from phosphorus, such as hæmatite pigs, &c., can be advantageously used. Short as is the time since Mr Bessemer took out his patent, his process has been already put into practice on a large scale in England, France, Belgium,

Sweden, and India.

We will now take a glance at the properties of each of these three kinds of iron, and the purposes to which it is chiefly applied. Cast iron, as the crudest, cheapest, and most fusible, is used for the heavy portions of engineering work, such as bed-plates for machines, cylinders, columns, eisterns, lowpressure boilers, water and gas pipes, rollers, girders, and the like. A large quantity is consumed in the manufacture of 'hollow-ware,' which includes pots, pans, and other cooking-vessels. For ornamental objects, again, it is almost exclusively used, because here its property of being readily cast into moulds gives it a great advantage on the score of cheapness. Thus, fountains, statues, vases, gates, balustrades, garden-seats, candelabra, stoves, fenders, and many smaller decorated articles, even to the minuteness of a watchguard and breastoin, are almost invariably made of cast iron.

Malleable iron differs considerably in its properties from cast iron. The latter is practically incompressible, but it can be comparatively easily torn asunder. Malleable iron, on the contrary, possesses great tenacity; it is, moreover, very malleable and ductile, especially at a high temperature, so that it can be rolled into sheets as thin as paper, or drawn into the finest wire. Further, it possesses the valuable property of welding, that is, two pieces can be and property of wealthy, that is, two pieces an be completely united together by hammering at a white heat. Malleable iron is largely employed for the immunerable variety of articles included under the general term 'hardware,' such as locks, keys, hinges, bolts, nails, screws, wirework, and the so-called tinplate, which is merely sheet iron dipped in melted tin. It is the mainstay of the railways and the electric telegraph, and is fast displacing timber as a material for bridges and steam-ships. A high interest is at the present time attached to the manufacture of rolled armour-plates for war-ships. Several were shewn in the late International Exhibition (1862) of large size; one of them measured 21 feet 3 inches long, 6 feet 3 inches wide, and

a few years back, have exceeded belief. Steel possesses several valuable properties which do not belong to either cast or wrought iron. It is harder, denser, and whiter in colour. It is also more elastic, takes a higher polish, and rusts less more ensure, takes a light poist, and the easily. But its most characteristic property consists in its admitting of being tempered at will to any degree of hardness. If, for instance, a piece of steel be heated to redness and plunged into water, it is made hard and brittle; but if it be again heated and slowly cooled, its original softness is restored. and slowly cooled, its original softness is restored, By gently reheating the steel, it will acquire a gradation of tints indicating various degrees of hardness, beginning with pale straw colour, and passing successively to full yellow, brown, purple, and finally to bine. The straw colour is the result of a temperature of about 440°, and the blue of about 570° E, the former being the hardest, and the

51 inches thick, and weighed about 13 tons. possibility of rolling such great masses of iron would,

latter the softest tempering.

The chief use of steel has hitherto been in the manufacture of files, edge-tools, and cutlery, for which its peculiar properties render it so admirably adapted. A large quantity is also consumed in the manufacture of needles and steel-pens. But the of these comparatively small articles. By means of improved machinery and processes, steel is at present manufactured on a scale that was little dreamed of a few years ago, so that such objects as field-guns, railway-axles, tires, boiler-plates, and the like are now being made of this material. The superior tensile strength of steel, which is about double that of malleable iron, gives it a great advantage where lightness is required.

Perhaps few things illustrate more strikingly than iron the great difference in value that exists between the same material according to the quality the average price of British pig-iron for 1861 was £3, 2s, per ton; mallcable iron in the form of bars £6 per ton; Swedish bars £15 per ton, and Lowmoor bars (the finest English iron) about £18. Superior sheet iron about £20, and fine wire about £40 per ton. and steel ranged from £30 to £60 per ton; while one ounce of steel, converted into hair-springs for watches,

becomes worth upwards of £1600.

The mining records of G. Britain show that there were, in 1867, 203 active iron works and 563 furnaces in blast, producing 4,761,023 tons of pig-iron, costing at the place of production £11,902,557. In 1868. 4,970,206 tons were made, valued at £12,381,280. In 1866, 1,691,945 tons of iron, wrought and unwrought, including unwrought steel, were exported from G. Britain. The values of the exports of 1868 and 1869 were £20,000,000 and £24,500,000, respectively, while that of hardware and cutlery for each year was about £4,500,000. The imports of iron and unwrought steel into the U. States in the year ending June 30, 1870, were valued at \$35,775,327. than 300,000 tons of rails are included in the above, valued at \$9,669,571-an extraordinary importation into a land abounding in coal and iron ores, and where every pound of iron and steel demanded in the arts should be produced. The iron and steel production of the U. States is, however, increasing. In 1869, 1,916,641 tons of pig-iron were made, while 593,586 tons of rails and 642,420 tons of rod, har, and sheetiron were turned out from her rolling-mills, and 35,200

tons of steel were produced.
3. Iron in its Physiological and Therapeutic Relations.-Iron is an essential constituent of the colouring matter of the blood-corpuscles of all vertebrate animals; and according to the best authorities, I part by weight of iron is found in 230 parts of blood-corpuscles, and the total quantity of this metal in the blood of a man weighing 140 pounds is about 38 grains. It is the presence of iron in the blood that communicates to the ashes of that fluid

their reddish-brown colour, the iron being found in them as the peroxide. The ashes of the hair, of birds' feathers, of the contents of eggs, of the gastric juice, of milk, and indeed of most animal fluids,

contain traces of this metal.

Nothing is known with certainty regarding the chemical condition of the iron in the animal body, that is to say, whether it is present as a protoxide, a peroxide, &c. It is introduced into the system with the food and drink, and any excess beyond what is required is discharged with the excrements. When an insufficient quantity is contained in the nutriment, chalybeate medicines become necessary. The iron that is set free within the system by the The mon that is set free within the system by the constant disinfegration of blood-corpuscles is carried out of, the system partly by the urine, partly by the colouring matter of the bile, which is highly ferruginous, and probably is in part climinated by the hair. The exact part which the iron plays in the body is uncertain; but it is most probable that the nower which the bind-corpuscles noisees as the power which the blood-corpuscles possess as oxygen carriers is mainly due to the presence of use of steel is no longer confined to the production | this substance.

When from any cause the blood-corpuseles are reduced in number, the state known as Anomio of the system the iron compounds are of incomparably more service than any other remedies, Chlorosis (q. v.), which is closely allied to anæmia, in amenorrhoa, and in certain painful nervous affections, the salts of iron are of especial service. The forms in which iron may be prescribed are very numerous, and vary considerably in their utility, according to the readiness with which they get taken up into the blood. Amongst the most generally used ferruginous medicines may be mentioned the tincture of the sesquichloride, the saccharine carbonate, the compound iron mixture (containing the carbonate), the sulphate, the potassio-tartrate, several citrates (especially the citrate of iron and quinine), &c. A course of Chalybeate Waters (q. v.) the patient cannot bear the administration of iron in its ordinary medicinal form.

IRON BARK TREE, a name given in Australia to certain species of Eucatylus (g. v.), and particularly E. resinifera, on account of the extreme hardness of the bark. These trees attain a height of 80 or 100 feet, and a circumference near the base of 20 to 25 feet. The timber is very valuable for ship-building, and for other purposes in which hardness and durability are required. It withstands vicissitudes of weather for a great number of years without injury, or even underground remains uninjured for 45 years or more. (Beanctt's Gutherings of a Naturalist in Australiasia, 1860).

IRON CROSS, a Prussian order of knighthood, instituted, on March 10, 1813, by Frederic William III, and conferred for distinguished service will make a war which was then being carried on. The decertion is an iron cross with ailver mounting. The grand cross, a cross of double the size, was presented exclusively for the gaining of a decisive battle, or the cauture or barve defence of a fortress.

IRON CROWN, the crown of the ancient Longobardian kings, given, according to an unauthenticated tradition, by Pope Gregory the Great to Queen Theodolinda, and preserved till 1859 in the Cathedral of Monza. Henry of Luxemburg, in 1311, is the first German emperor who is known to have worn it. In 1859, it was removed by the Austrians to Mantia, and afterwards to Vienna, but by the treaty of 1866 it was restored to the Italians. The outer part of the crown consists of a golden hoop, with enamelled flowers and precious stones, in form like an ancient nowers and precious stones, in John Ince a alicent diadem, within which is a thin plate or filler of iron, which is declared by a tradition long opposed by the church at Milan, but adopted by the con-gregation 'dei sacri rit' at Rome, to have been hammered from one of the nails of the true cross; hence the crown is also called il sacro chiodo, When Napoleon I. was elected king of Italy in 1805, he took the relic from the tesoro of Monza, where it had remained from the time of Charles V., and crowned himself with it, disdaining to receive it from the hands of a bishop; and at the same time. he founded an order of knighthood, taking its name from the iron crown. The reigning kings of Italy were to be grandmasters of the order; and the members of the order, at first 620 in number, and afterwards 985, were either dignitaries, commanders, or knights. The badge was the iron crown, and in the middle, the French eagle with raised wings. Round the ring of the crown was the motto, Dio me la diede, quai a chi la tocca ('God gave it to me, woe to him who touches it')-the words used by Napoleon when placing the crown on his head; and the front exhibited the effigy of Napoleon. The order-forgotten after the fall of Napoleon-was restored and re-modelled in 1816 by the Emperor Francis I., who gave it the name of the Austrian Order of the Irou Crown, limited its members of

Iron Crown of Italy.

the 1st class to 20, of the 21 to 30, and the 3d to 50, exclusive of the princes of the imprical house. He introduced a new decoration in place of the former one, consisting of a gold crown of the same form with the iron crown, on which is placed the Austrian eagle on both sides, bearing upon the oliverse a blue escutcheon upon the breast, with the electre F (Francis) in it; and on the reverse, the year 18th. The knights of the 1st class have, in the contract of the contrac

IRON MASK, THE MAS WITH THE. The story of the prisoner, so called, confined in the Bastile and other prisons in the reign of Louis XIV., has long kept up a romantic interest. The first notice of him was given in a work entitled Memoires Secreta pour serier à l'Histoire de Perce (Amst. 1745—1746). According to this writer, he was the Duke of Vernandois, a natural son of Louis XIV, and De la Vallière, who, having given a box on the ear to his hald-brother, the grand dauphin, had to expiate his hald-brother, the grand dauphin, had to expiate without foundation, for the Duke of Vernandois died in camp in 1683; but the continene with which it was made caused a deep secastion, and the romance of Monity, L'Homme ou Masque de Fer, which immediately followed (Hague, 1746), was read with all the more avidity that it was prohilated. Voltaire, in his Stècle de Louis XIV., texast the anecodo historically. According to him, the prisoner was young, and of a noble figure. In journeying from one prison to another, he were a mask, and was at last transferred to the Bastile, where he was treated with great distinction; and where he was treated with great distinction; and

In the meantime, an endless variety of hypotheses were formed on the subject. Some Dutch writers asserted that the prisoner was a young foreign mobleman, the chamberhain of Queen Aone, and the real father of Louis XIV. Lagrange-Chancel attempted to prove, in U-Anne Entleraire for 1753, that the Mask was no other than the Duke of Beaufort, the King of the Marketa, as he was called,

a supposition conclusively set aside by Sainte-Aulaire in his History of the Fronde.

The first authentic information with regard to the Iron Mask was given by the Jesuit Griffet, who acted for nine years as confessor in the Bastile, in his Traité des disserntes Sortes de Preuves qui servent à établir la Vérité dans l'Histoire (Liège, 1769). He brought forward the MS. Journal of Dujonca, the lieutenant of the Bastile, according to which Saint-Mars arrived, on the 18th September 1698, from the Isle de Sainte-Marguerite, bringing 1995, from the Isse of Stantes-Marguerre, brigging with him in a litter a prisoner whom he had already had in custody at Pignerol. The prisoner's name was not mentioned, and his face was always kept, concealed by a mask of black velvet. The journal mentions his death on 19th November, 1703, and that he was buried in the cemetery of St Paul. This is confirmed by the register of burials for the parish of St Paul's, where the prisoner is mentioned under the name of Marchiali. Griffet himself inclines to the supposition advanced in the Mémoires

After long silence, Voltaire returned to the subject in his Essai sur les Mœurs, but he brought forward nothing new. In the seventh edition of the Dictionnaire Philosophique, he related the story anew, under the head Anna, corrected his errors as to time from the journal of Dujouca, and concluded with the assurance that he knew more about the matter than Griffet, but chose, as a Frenchman, to be silent. An addition to the article, apparently by the editor of the work, freely states the opinion that the Mask was an elder brother of Louis XIV. The writer makes Anne of Austria to have had this son by a favourite, and being thus undeceived as to her supposed barrenness, to have brought about a meeting with her husband, and in consequence born Louis XIV. Louis is held to have first learned the existence of this brother when he came of age, and to have put him in confinement, to guard against any possible unpleasant consequences. Linguet, in the Bastille Dévoilée ('The Bastile Exposed'), ascribes this paternity to the Duke of Buckingham. ascribes this paternity to the Duke of Buckingham. Saint-Michel published a book in 1790, in which he relates the story of the unfortunate being, and points to a secret marriage between Queen Anne and Cardinal Mazarin. What is remarkable is, that the court continued to manifest an interest in the matter, and took every means to keep the identity of the prisoner in the dark. When the Bastile fell, the prisoner's room was eagerly searched, and also the prisoner's room was eagerry scarches, and also the prison register; but all inquiry was vain. The Abbé Soulavie, who published Memoires de Maréchal Richelieu (Lond. and Par. 1790), tries to make out from a document written by the tutor of that unfortunate prince, that the Iron Mask was a twin-brother of Louis XIV. A prophecy had annonneed disaster to the royal family from a double birth, and to avoid this, Louis XIII. had caused the last born of the twins to be brought up in secret. Louis XIV. learned of his hrother's exist-ence only after the death of Mazarin, and that brother having discovered his relation to the king by means of a portrait, was subjected to perpetual imprisonment. This view of the matter was that almost universally prevalent till the time of the Revolution. It is also followed in Zschokke's German tragedy, and in Fournier's drama, founded on the story.

The first conjecture of what seems the truth is The first conjecture of what seems the truth is sense to contained in a letter dated 1770, written by a Baron and Gressen and the sets to the Journal Encyclopédique. The same is repeated by Louis Dutens in his Intercepted Correspondence (1789), who declares that there is no point of history better established than the fact a maning exactly opposed to their literal sense, that the prisoner with the Iron Mask was a minister! When skillully used, irony is one of the most crushing

of the Duke of Mantua. This minister, Count Matthioli, had pledged himself to Louis XIV, to urge his master the duke to deliver up to the French the fortress of Casale, which gave access to French the fortress of Casale, when gave access to the whole of Lombardy. Though largely bribed to maintain the French interests, he hegan to betray them; and Louis XIV., having got conclusive proofs of the treachery, contrived to have Matthioli lured to the French frontier, secretly arrested, 21 lured to the French frontier, secretly arrested, 27 May 1679, and conveyed to the fortress of Figuerol, which was his first prison. The conclusion of DHeiss and Duttens, that Matthioli was the Iron Mask, though acute, was only a conjecture. But the documents since discovered and published by M. Icoux-Faziller in his Recherches historiques et al. The Control of the critiques sur l'Homme au Masque de Fer (Par. 1800), and by M. Delort in his Histoire de l'Homme Isoto, and by M. Delort in his Histoire de l'Homme au Masque de Fer (Par. 1825), leave little doubt on the subject. The reason why so much pains was taken to preserve the secret seems to have been that Matthioli being a minister plenipotentiary at the time, his seizure was a flagrant violation of the law of nations, which it was safer to be shle to deny than to attempt to justify; and the denial once made, the honour of the court was involved in upholding it. See The True History of the Iron Mask, by G. A. Ellis (Lond. 1826); The Man with the Iron Mask, by Marius Topin, translated by H. Vizetelly, and Le Masque de Fer, &c., par Jules Loiseleur, Art. de La Rev. Contemp., 1867—1869, and by Th. Jung. Ibid., 1870.

IRONS, otherwise called BILBOES, are shackles of iron into which the ankles of a prisoner are fixed, and which slide on a long iron bar. Refractory sailors and soldiers, who evince violent behaviour. and become unmanageable, are commonly put in irons, several being placed side by side along the same bar. In cases of extreme violence, the wrists may be similarly treated, but instances of this latter punishment are rare. The punishment of 'putting in irons' is more common in the navy than in the

IRONWOOD, a name bestowed in different countries on the timber of different trees, on account of its great hardness and heaviness .- Metrosideros vera belongs to the natural order Myrtacea, and is a native of Java and other eastern islands. It has ovato-lanceolate, shortly stalked, smooth, sharp-pointed leaves; and axillary, many-flowered, stalked cymes. Its wood is much valued by the Chinese and Japanese for making rudders, anchors, &c., and is imported into Britain in small quantities under the name of Ironwood. The bark is used in Japan as a remedy for diarrhea and mucous dis-Japan as a rementy for duarrace and mucous dis-charges.—Messua ferrea, a tree of the natural order Guttiferæ, is a native of the East Indies, and is planted near Buddhist temples for the sake of its fragrant flowers, with which the images of Buddha are decorated. The flowers resemble small white roses, and contrast singularly with the deep crimson buds and shoots. The timber, known as I., is very hard, as is that of M. speciosa, another tree of the naro, as is that of M. speciose, another tree of the same genus and region—The wood of Vepris undulata, of the order Diosmacca, is called White L at the Cape of Good Hope. It is very hard and tough, and is chiefly used for axles, ploughs, and other agricultural implements—The wood of Olea lawrifolia, a species of olive, is called Black I. in the game country, and is used for the same purposes,

and irresistible figures of rhetoric. Instances will readily occur to every reader of history and literature. One of the most celebrated is that recorded in Scripture, where Elijah taunts the discomitted priests of Baal on Mount Carmel. The great master of irony in ancient times was Socrates, who, as has been happily said, raised it to the dignity of a philosophic method.

IROQUOIS. See Indians.

IRRATIONAL NUMBERS, a term applied to those rosts of numbers which cannot be accurately expressed by a finite number of figures. For instance, \(2'\) is an irrational number. If the diameter of a circle is one foot, the circumference is an irrational number. Irrational numbers have been defined to be numbers which are incommensurable with unity. They are also commonly termed Sards.

IRRAWA'DI (said to mean, like Mississippi, 'father of waters'), the great river of Farther India, is believed to rise in Tibet, near lat, 28° N., and long, 98° E., terminating in lat. 16° 20' N., and long, 96° E. Its course is pretty nearly due south, and has been estimated at 1200 miles in length. After receiving the Ning-thee, the Mogonny, the Bhamo, and the Lungtchuen, it begins to form its delta about 17 N., which, between the Rangoon on the east and the Bassein on the west, comprises 10,000 square miles of forest and pasturage, curiously intersected by an inextricable network of the smaller branches of the stream. With regard to facilities of communication, the L appears to be decidedly superior to the Indus and the Ganges, being navigable even at low water, for vessels of 200 tons, as far as Ava, which is 400 miles from the sea, and for canoes as far as Bhamo, which is 180 miles higher up. The L successively traverses China, Burmah, and Pegu. As the region last mentioned, forming the lowest part of its basin, is a province of British India, the L, as a whole, may be said to be virtually under the control of Eng land. In both our Burmese wars, it constituted the line of advance for our armies.

IRREDU'CIBLE CASE occurs in the solution of Cubic Equations (q. v.) by Cardan's method when p is negative, and $\frac{p^2}{27}$ greater than $\frac{q^3}{4}$ (abstracting

from the sign). These conditions render $\sqrt{\left(\frac{q^2}{4} + \frac{p^2}{27}\right)}$ an imaginary quantity, and thus Cardan's formula fails in its application. The difficulty is got over by the aid of trigonometry.

IRRE'LEVANT, a term used in Scotch law to denote that what is said or put forward by an opponent in an action has no bearing on the subject, even if it were true. The corresponding term, in English law, is that the pleading containing the irrelevant matter is demurrable.

IRRIGA'TION (Lat. watering), a method of producing or increasing fertility in soils by an artificial supply of water, or by inundating them at stated periods. Irrigation was probably first resorted to in countries where much of the land must otherwise have remained barren from drought, as in Egypt, where it was extensively practised nearly 2000 years before Christ, and where great systems of canals and artificial lakes were formed for the purpose. Extensive works, intended for the irrigation of large districts, existed in times of remote antiquity in Mesopotamia, Persia, India, China, and some other parts of the East; and in such of these countries as have not entirely lost their ancient prosperity, such works still exist. In many parts of the world, the necessity of irrigation, at least at certain seasons of the year, is so strongly felt, that

the agriculture even of comparatively rude tribes depends on the facility with which it can be accomplished. Some phasts also require a very abundant supply of water, and irrigation has become general where their cultivation prevails. This is particularly the case with rice, the principal grain of great part of Asia. Irrigation is supposed to have been untroduced into Britain by the Romans, but was very little practised till the beginning of the present century. In Europe, irrigation prevails cheldy in the south, where it was extensively practised by the Romans, from whom it was adopted by the Lomans and it is most extensively practised in Lomans and it is most extensively practiced in Lomans and the superior of the present production of the Po. Adige, Tagus, Domo, and other rivers, south of France, so that the great phins and valleys of the Po, Adige, Tagus, Domo, and other rivers, are almost entirely subjected to a systematic irrigation, which prodigiously increases their fertility. The extent of irrigated land in the valley of the Po is estimated at 1,600,000 acres, and the increase of rental thus caused at 2,830,000.

Irrigation in Britain, and in most parts of Europe, except Lombardy, is almost exclusively employed for the purpose of increasing the produce of grass by converting the land into water-meadows. The value of it, even for this one purpose, does not seem to be sufficiently understood. Poor heaths have been converted into luxuriant meadows by means of irrigation alone. But in the countries in which irrigation is most extensively practised, the pro-

duction of all crops depends on it.

The irrigation of land with the sewage water of towns is, under another name, the application of liquid manure. In no small degree the water of rivers and of springs depends on its organic and mineral constituents for its fertilising properties, so that the application of it is not in principle different from that of liquid manure; but it must be borne in mind that the mere abundance of water itself is of great importance for many of the most valuable plants, as the most nutritions substances brought into contact with their roots are of no use to them unless in a state of solution; whilst it is an additional recommendation of irrigation, that the supply of water most favourable to the growth of many valuable plants, is destructive of some which in many places naturally encumber the soil, as heath, broom, &c. The water which is used for irrigation should be free from mud and such impurities as mechanically clog the pores of leaves, or cover up the hearts of plants, and interfere with their growth. Irrigation is far from being so extensively practised in Great Britain as seems desirable. The extent of water-meadows in England is stated to be not more than 100,000 acres. They are mostly confined to the west and south of England. Individual farms, irrigated with sewage water, are to be met with in Nottinghamshire, Staffordshire, Lancashire, Cheshire, and in one or two counties in Wales. The most successful instance, however, of sewage irrigation in Great Britain is to be found Edinburgh, where an extensive tract of meadows, lying between Portobello and Leith, vield a rent of £20 to £40 an acre; the grass is cut from three to five times a year, and as much as ten tons an acre have been obtained at a cutting. See SEWAGE, MANURE.

The method of forming and laying out watermeadows will be easily gathered from the following sketch of the different species of irrigation as

practised in this country.

 Bed-work Irrigation.—This method can only be conveniently applied to ground which is nearly level. It consists in laying out the ground into aloping beds or ridges, from 30 to 40 feet wide, according to the nature of the soil, having their

upper ends lying in a gentle slope from one side to the other of the meadow. Along the upper ends of the beds is drawn the drain or conductor, which brings the water from the reservoir or river, as the case may be; and this conductor must be tapered off towards its further end, in order that the diminished supply of water may still everflow. From this conductor, small drains, called feeders, are led down along the crown of each ridge. In the lowest part of the meadow, a main-drain, which must be part of the meanow, a main-urain, which must be made nearly as large as the conductor, is cut across the lower ends of the beds, and the water, after having served the purpose of irrigation, is led into it, by means of small drains cut in the furrows. The feeders should, like the conductor, taper towards their further extremity, both for the purpose of retarding the velocity of the water, and of preserving a continual overflow along their whole length. On the contrary, the small drains should gradually widen towards their lower extremity, where they meet the main-drain. The dimensions and inclination of the conductor and feeders should and inclination of the contactor and reduces should be so regulated to the water-supply, that the beds can be wholly laid under water to the depth of about one inch. The expense of bed-work irrigation ranges from £20 to £40 per acre.

2. Catch-work Irrigation differs materially from

the former; it can be applied to land whether level or not, costs only £4 per acre, and, in the opinion of many, is quite as effective. The conductor formed as before is led along the highest side of the field, then with the aid of a level, a succession of perfectly level gutters (which, of course, must be winding), are drawn across the field in the same direction as the conductor, and not more than ten yards from each other; these are crossed by feeders running from the conductor to the lowest side of the field, thus forming a kind of checkwork. The maindrain is made as before, and the feeders, which taper towards their lower extremity, serve for small drains. This plan is more effective than the former, when the supply of water is limited; and as it can be applied to a hillside as well as to a level field,

of application is rapidly extending.

3. Subterraneous Irrigation is only applicable to perfectly level fields, and consists, first, of ditches being formed all round the sides. At right angles to these, drains or conduits are drawn across the field in parallel lines. When the land is to be irrigated, water is let into the ditches, and thence to the cross-drains, till it rises to the level of the surface; and when the ground is to be laid dry, the side-ditches are emptied by sluices. The bottom of the ditches is below the level of that of the cross-drains, so that they serve both as conductor and main-drain.

The first two methods of irrigation are only applied to pasture-lands, and the third to fens and drained morasses, which are apt to become parched in snmmer; the last method would be very valuable for land under green crop in cases

of drought.

The management of water-meadows requires great skill and care, but we can only here mention the chief points to be attended to, which are these: the water, if limited in quantity, must be confined to a part which it can effectually irrigate; too to a part which it can effectively regard; too much water or too rapid a flow tends to wash away the soil; the meadow may be kept under water for a fortnight at a time, in November, but the time should be diminished till April or May, when regular watering should cease; after the grass is cut or eaten down, the water may be let on for a few days; and it is necessary that between the times of watering the laud should be laid building, and the manufacture of book-muslins, perfectly dry. Special precantions are necessary in jaconets and checks, are among the branches of

winter, to guard against any bad effects resulting from frost, &c.

IRRITABI'LITY in Plants, a term employed to designate phenomena very interesting and curious, designate phenomena very interesting and curious, but than which none connected with vegetable life are more imperfectly understood. Such are the phenomena of what is usually called the Sleep (q. v.) of plants; the motion of the Spores (q. v.) of many cryptogamic plants by means of cilia; the motions of Oscillatoria, Diatomacea, and others of the lowest Alga; the successive approaches of the stamens of Adja; the successive approaches of the stations of Parnassia palustris to the pistil; the movements of the leaves of the Moving Plant (q. v.) of India; and those caused by agitation or by the touch of a foreign body in the leaves of Sensitive Plants (q. v.), of the Dionæa or Venus's Fly-trap, &c., in the stamens of the Barberry, Schizanthus, &c., and in the stigmas of Mimulus, &c. Many explanations have been of Minitus, ac. Many explanations have been proposed of these phenomena, but none satisfactory. Of the existence of anything analogous to the nervous system of animals, which has been imagined, there system of annuary, which has been imagined, there is not the slightest proof, closely as some of the phenomena resemble those of animal life. The explanations which have been proposed are no better than mere guesses. See Musches.

I'RRITANCY (Lat. irritus, of no effect), a term in Scotch law to denote something in the nature of neglect or injury which destroys or makes void an existing right; in English law it is called Forfeiture. Thus, there is the irritancy of a fenright from non-payment of the duty for two years. -IRRITANT CLAUSE, in a Scotch entail, is a clause which makes void certain prohibited acts of the heir of entail, such as selling the property.

IRRITATION is the term applied to any morbid excitement of the vital actions not amounting to inflammation; and it is often, but not always a cause

of that condition. In cases of irritation, remarkable sympathetic symptoms are often observed. Thus, irritation of a calculus occasions intense sickness and vomiting. But of all sources of sympathetic morbid affections of this class, irritation of the stomach and intestines is at once the most common and the most important. The ordinary sick headache is the most frequent form of this sympathetic affection; but in certain morbid conditions, and especially in the puerperal state, the symptoms may be such as pretty closely to resemble those of acute inflammation of the peritoneum, the heart, the pleura, or the membranes of the brain. It is to Dr Marshall Hall that the credit is mainly due of pointing out those cases in which irritation so closely resembles inflammation. He has shewn that blood-letting affords a certain means of diagnosis in these cases. In true inflammation, 30 or 40 ounces of blood may be taken before there are any symptoms of faintness; while in irritation, the loss of a very few ounces (nine or ten) of blood will cause the most decided syncope.

IRTI'SH, a river of Siberia, an affluent of the Obi (q. v.).

I'RVINE, a royal and parliamentary burgh, seaport, and market-town of the county of Ayr, Scotland, is situated on both banks, but principally on an eminence on the right bank of the river Irviue, which is here crossed by a handsome stone bridge, about a mile above the embouchure of the river in the Firth of Clyde. It is II miles north of Ayr, and 29 miles south-west of Glasgow by railway. The harbour has now become so much sanded up, as only to admit vessels of about 100 tons burden. The 'Academy' is one of the most flourishing educational institutions in the west of Scotland. Shipindustry. Formerly, many women were employed in sewing muslins. In 1861, 6239 vessels, of 575,536 tons, entered and cleared the port. I. unites with Ayr, Campbelton, Obao, and Inversary in sending a member to parliament. Pop. (1861) 7000.

HRYING, Washinsorrox, a distinguished American anthor, was born in the city of New York, April 3, 1783. He was the youngest son of William Irving, who had emigrated from Scotland, and settled in New York as a merchant before the Revolution. Washington I., at the age of 16, entered a law office; but he profited largely by his atther's well-stocked library, Chaucer and Speaser period, was a small town of about 50,000 inhabitants, many of whom were descendants of the original Dutch settlers, having quaint manners and customs, of which I. was a curious observer. In 1804, with the excuse of a tendency to pulmonary disease, he visited, and travelled extensively in Europe; returned to New York in 1807, and contributed a series of genial and humonus essays to a periodical called Sing. Front. Berginning of the World to the End of the Dutch Demarks, by Dictrick Knitchrocker, a burlesque chronicle written in so quiet a vein of humour. It is has sometimes been

taken for a veritable history

Having no inclination for law, he engaged in commerce with his brothers as a silent partuer, but devoted his time to literature, and in 1813, edited the Analectic Magazine, in Philadelphia. close of the war in 1815, he visited England, where he was warmly welcomed by Campbell, whose biography he had formerly written, and was intro-duced by him to Walter Scott. While he was enjoying his English visit, his commercial house failed, and he was suddenly reduced to poverty, and the necessity of writing for his bread. The Sketch-book, portions of which had appeared in New York, was offered to Murray, and afterwards to Constable, but was refused by both of these celebrated publishers. After an unsuccessful attempt of the author to publish it on his own account, Murray, on Scott's recommendation, took the Sketch-book, paying £200 for the copyright, which he afterwards increased to £400. It had a charm in its beauty and freshness, and was a surprise as the work of an American, and was therefore received with great favour. I. went to Paris, and in 1822 wrote Bracebridge Hall, and in 1824 the Tales of a Traveller. He was then invited by Everett, the American ambassador to Spain, to accompany him to Madrid, to translate documents connected with the life of Columbus. With these materials he wrote his History of the Life and Yoyages of Columbus (1828); Yoyages of the Com-panious of Columbus; The Conquest of Granada; in the ancient palace of the Moorish kings; Legends of the Conquest of Spain (1835); and Mahamet and his Successors (1849). In 1829, I. returned to England as secretary to the American legation. In 1831, he received the honorary degree of LL.D. from the university of Oxford; and next year returned to America, where he was received with great cothusiasm. A visit to the Rocky Mountains produced his Tour on the Prairies. He also contributed sketches of Abbotsford and Newstead Abbey to the Crayon Miscellany, and from the Abbey to the Crayon Miscellany, and from the papers of John Jacob Astor, wrote Astoria (1837), and the Adventures of Captain Bonneville; also a series of stories and essays in the Knickerhocker Magazine, collected under the title of Wolfert's Roost. In 1842, he was appointed minister to Spain. In 1846 was published his Life of Goldsmith; and his

great work, the Life of Weakington, was published in 1835-1859. An eithin on his works in 15 vols, reached a sale of 250,000 vols. He spent the last vears of his life at Sumysside, in his own '8 leepy 116,000,' on the banks of the Hudson, near Tarrytown, with his nieves, where he died suddeely of disease of the heart, November 28, 1859. He was never married.

IRVING, REV. EDWARD, was born in the town of Annan Damfriesshire, August 15, 1792; studied at the university of Edinburgh, and, after completing his curriculum for the ministry, became assistant (in 1819) to Dr Chalmers, then a minister in Clasgow. His sermons did not prove very popular. Chalmers himself was not satisfied. In 1822, I. received a call to the Caledonian Church, Hatton Garden, London, which he accepted. His success as a preacher in the metropolis was such as was never witnessed before or since. After some years, however, the world of fashion got tired of I.; but it was not till his more striking singularities of opinion were developed that fashion finally deserted him. At the close of 1825, he began to announce his convictions in regard to the second personal advent of the Lord Jesus, in which he had become a firm believer, and which he declared to be near at hand. This was followed up by the translation of a Spanish work, The Coming of the Messiah in Majesty and Glory, by Juan Josufat Ben Ezra, which professed to be written by a Christian Jew, but was, in reality, the composition of a Spanish Jesuit. L's introductory preface is regarded as one of his most remarkable literary performances. In 1828, appeared his Homilies on the Sacraments, He now began to elaborate his views of the incarnation of Christ, asserting with great emphasis the doctrine of his oneness with us in all the attributes of humanity. The language which he held on this subject drew upon him the accusation of heresy; he was charged with maintaining the sinfulness of the was charged with maintaining the samaness of Christ's nature, but he paid little heed to the alarm thus created. He was now deep in the study of the prophecies; and when the news came to London in the early part of 1830, of certain extraordinary manifestations of prophetic power in the west of Scotland (see IRVINGITES), I. was prepared to believe them. Harassed, worn, balled in his most sacred desires for the regeneration of the great Babylon in which he dwelt, branded by the religious public, and satirised by the press, the great preacher, who strove above all things to be faithful to what seemed to him the truth of God, grasped at the new wonder with a pas-sionate earnestness. Matters soon came to a crisis. 1. was arraigned before the presbytery of London in 1830, and convicted of heresy; ejected from his new church in Regent's Square in 1832; and finally deposed in 1833, by the presbytery of Annan, which had licensed him. His defence of himself on this last occasion was one of his most splendid and sublime efforts of oratory. The majority of his congregation adhered to him, and gradually a new form of Christianity was developed, commonly known as Irvingism, though I. had really very little to do with its development. Shortly after, his health failed, and in obedience, as he believed, to the Spirit of God, he went down to Scotland, where he sank a victim to consumption. He died at Glasgow, December 8, 1834, in the 42d year of his age.—See Carlyle's Miscellaneous Essays, and Mrs Oliphant's Life of Edward Irving (London,

IRVINGITES, the common but improper designation of a body of Christians who call themselves collectively the Apostolic Catholic Church. Their

existence as a distinct sect dates from about the year 1830. In the winter of 1829-1830, the Rev. Edward Irving (q. v.), then a minister of the Scotch Church, Regent Square, London, delivered a series of lectures on spiritual gifts, in which he maintained that those which we are in the habit of calling 'extrathose which we are in the nabit of caning 'extra-ordinary' or 'miraculous,' were not meant to be confined to the primitive church, but to be con-tinued through the whole period of the present dispensation. About the same time, as if to confirm the views of the great preacher, there occurred at Port-Glasgow, in the west of Scotland, certain strange phenomena. It was alleged that miraculous acts of healing had happened, and that the gift of tongues had reappeared. After what seemed to be a sufficient investigation on the part of some of the members of Mr Irving's church, it was concluded that the manifestations were genuine. Similar manifestations shortly after occurred in his own church, which were also pronounced to be genuine. They were held to be of two kinds: 1st, speaking They were held to be of two kines: is, speaking in tongues, and 2d, prophesying. As the former bore no resemblance to any language with which men were conversant, it was believed to be strictly an 'unknown tongue,' the Holy Ghost 'using the tongue of man in a manner which neither his own tongite of man in a manner which mether his own intellect could dictate, nor that of any other man comprehend. The latter, 'prophesying,' consisted chiefly of 'exhortations to holiness, interpretations of Scripture, openings of prophecy, and explanations of symbols.' After some time, Irving was deposed from his office for heresy by the Church of Scotland, but meanwhile the religious opinions with which but meanwhile the religious opinions with which his name is associated had been assuming a more definite and ecclesiastical shape. The final result was the Apostolic Catholic Church, the constitution of which is briefly as follows:

"There are any an annexe of the control of the cont

The Catholic Apostolic Church does not differ from other Christian bodies in regard to the common doctrines of the Christian religion; it only accepts, in what it considers to be a fuller and more real sense, the phenomena of Christian life. It believes that the wonder, mystery, and miracle of the apostolic times were not accidental, but are essential to the divinely instituted church of God, and its main function is to thoroughly prepare a people for Christ when he comes in his kingdom. A very special feature of the Catholic Apostolic Church is its extensive and elaborate symbolism. In regard to the sacrament of the Lord's Supper, however, it appears to entertain very much the same view as the Roman Catholic Church.

The Catholic Apostolic Church has established itself in England, Canada, the United States, Prussia, France, and Switzerland, but the congregations are not numerous.

ISAAC ('he will langh'), a Hebrew patriarch and paterni chief, was the so mid Abmlann and sarb, and half-ivorther of Ishuach Abmlann and Barnh, and half-ivorther of Ishuach davasced in age. The incidents of his life, as recorded in Genesis, are well known. He died at Hebron, aged 180 years, leaving two sons, Jacob and Esau.—L's character has always been very differently interpreted. What has been called by some his mild and gentle disposition, simple pastoral piety, others have termed various and want of character. His (for the most various and want of character. His (for the most various and want of character. His (for the most various and want of character. His (for the most various and want of character. His (for the most various and vant of character. All for the most various and vant of character. His for the most of the all determined the property of the supplementation of the all various of the determined the supplementation of the alternoou prayer.

ISAAC I., COMNENUS, emperor of Constanti-nople, was the first of the family of the Comneni who attained to that dignity. His father Manuel, his bother John, and himself were employed in important military and civil capacities by Basil II. 1976—1025; but during the reign of the latter's imbecile and tyrannical successors, in whose eyes incoming the control of the contro it was criminal for any one to excel in wisdom and ability, L was exposed to considerable danger. and ability, L. was exposed to considerant unique. Such, however, was his prudence, and the affection of the people for him, that the emperors unwill-ingly suffered him to live unmolested; and on the deposition of Michael VI. (1056—1057), I. was elevated to the vacant throne. On his accession, he found the affairs of the empire in what was by this time their normal condition; rebellion within, aggression without, and the treasury exhausted. degression without, and the treasury canadiscat He succeeded in establishing a system of great economy in all branches of the administration, and in order still further to lighten the taxes on the people, called upon the clergy to contribute their share. But the clergy, then as now, refused to endure the imposition of any such burdens, and the patriarch Michael is reported to have even threatened him with deposition. But death delivered I. of this formidable opponent, and the clergy were compelled to submit. In 1059, he repelled the Hungarians, who had encreached upon his possessions in the north-west; but soon afterwards, to the great grief of his subjects, he was attacked by a violent fever, and believing his dissolution approaching, appointed his famous general, Constantine Ducas, as his successor. He, however, recovered from his illness, but resigning the crown, retired to a convent, where he lived for two years in the odour of sanctity, and died in 1061. He was one of the most virtuous emperors of the East, and to great learning, wisdom, and prudence, united an adminis-trative ability and energy, that would, had his reign been of longer duration, have gone far to regenerate the effect Byzantine empire. Nor was he deficient in literary attainments. We still possess by him Scholia—hitherto nuedited—on Homer, his favourite author; further, a work, Characteristics, scil., of the Greek and Trojan chiefs mentioned in the Iliad; and finally, a treatise On the Works of Homer.

ISABELLA of Castile, queen of Spain, born on 23d April 1451, was the daughter of John II., king of Castile and Leon, and in 1469 married Ferdinand V., surnamed 'the Catholic,' king of Aragos. On the death of her brother, Henry U., in 1831, she ascended the throne of Castile and Leon, to the exclusion of her clder eister Joanna. Slie had won the support of great part of the states of the kingdom during her brother's life, and the victorious arms of her husband compelled the consent of the rest (see Fredinard). I. was a woman of remarkshile energy and talent, and possessed no inconsiderable heauty and much winning grace, although proud, ambitious, and deficient in

true womanily gentleness. Sibe was always present in meetings of council, and insisted on the use of her name along with that of Ferdinand in all public documents. She died at Medina del Campo, on 26th November 1504, after lawing exacted from the husband, of whom she was always jealous, a promise, confirmed by oath, never to marry again.

ISABELLA THE CATHOLIC, ORDER OF, a Sygnish order

of Grand Crosse

of Grand Crosses, Commanders, and Knights, ISAI'AH (Heb. Yeshayahu, 'Salvation of God'). ISAI AH (Heb. I esadyimi, 'saivation or God'), the most sublime of the Hebrew prophets, was the son of one Amoz. He uttered his oracles in the regims of Uzziah, Johann, Ahaz, and Hez-kiah, kings of Judah. Regarding his outward life, almost nothing is known. He appears to have resided at Jerusalem, in the vicinity of the temple, was married, and had three sons, given him, he says, for signs and for wonders in Israel. The period of his death is not known, but according to a rabbinical legend, apparently accepted by the writer of the Epistle to the Hebrews (xi. 37), (Sanh. 103 b, &c.), he was sawn asunder by order of King Manassak, who abhorred his oracles (cf. Jos. Ant. x. 31). If this statement is well founded, I. must have been nearly 100 years old when he was thus barbarously nurdered.—The prophecies of L, viewed in their literary aspect, do not exhibit a continuous unity of design; they consist of a series of 'visions' beheld at different times, and arranged neither exactly in chronological nor material order. The compiler or editor of the whole is helieved by many not to be I. himself. Verse 38th of chap xxxvii. is regarded by the majority of scholars of note as conclusive proof of a later hand. The grand controversy, however, is not concerning the arrangement of these prophecies, but concerning their authorship. Did they all proceed from one and the same person, or are different anthors discernible? Orthodox critics maintain the unity of authorship, and assert that I., if he did not edit, certainly wrote the whole 66 chapters. The first who doubted this was the German scholar Koppe (1779-1781), who suspected that the last 27 chapters (40-66) were the work of a later hand. He was followed by Döderlein, Eichhorn, and Justi, and the same view has been substantially adopted by Paulus, Bertholdt, De Wette, Gesenius, Hitzig, Knobel, Umbreit, and Ewald. The chief arguments against the Isaiah-authorship

are: 1. That the subject-matter of these burdens relates to what happened long after I's death, 100 years at least, viz., the redemption of the Jews from captivity, consequent upon the overthrow of the Babylonian monarchy by the Medo-Persian army. 2. That the writer speaks of the exide as something present, and of the desolation of Julah as a thing that had already taken place. 3. That Cyrus is mentioned by name, and an intimate knowledge exhibited of his career. 4. That an extra-ordinarily minute acquaintance with the condition and habits of the exiles is shewn. 5. That the seutiments are far more spiritual. 6. That the style is totally different, heing more smooth, flowing, rhetorical, and clear. To these objections, Heng-stenberg, Hävernick, Keil, Henderson, Jahn, Möller, Alexander, and others have replied more or less satisfactorily. Their principal argument is the predictive character of prophecy. In these prophecies, we have the first distinct and vivid announcements of a Messianie deliverer (whence I. has been called the 'Evangelical prophet'). As, however, they are found chiefly in the last 27 chapters (the supposed work of a Deutero-Isaiah), it has been made a question, by those who do not believe in prophecy in the usual sense, whether the 'deliverer,' who redeems the people by his own sufferings, is a literal prediction of Jesus Christ on the part of the prophet, or only a personification of the sanguine hope of deliverance that animates his patriotic and religious soul.

stenberg, and Alexander.

I'SAR, or ISER, a river of Germany, rises in the Tyrol, to the north of Innsbruck, and, entering Eavaria, flows generally in a north and north-east direction, and joins the Danube at Deggendorf, after a course of about 180 miles. Munich and Landshut are situated upon its banks. In the first part of its course, for an imperituous mountain many rapids and islands, but for a great part of its course it is navigable for boats. Much wood is floated down the 1. from the mountains.

I'SCHIA (the ancient **Earrie*), an island situated between the Bay of Naples and that of Gacta. It is about 24 square miles in extent, and has a population of 25,000 inhabitants. It is a favourite place of summer resort, and is noted for the excellence of its mineral waters, and numerous springs, the great richness of its soil, the exquisite davour of its fruits and wines, and the enchanting character of its assency. It highest point is the volcane case, of which the emptions have been numerous and disastrous; that of 1302 was of two mouths duration, and occasioned a serious loss of the and property. The Lake of Ischia appears to occupy an extruct crafter of the volcano, and abounds in fish.

YSCHL, a small town of Upper Austria, surrounded on all sides by gardens, is finely situated on the river Traun, amid magnificent Alpine scenery, 28 miles east-onth-east of Sakburg. It is the chief town of the district called the Sakkammergut (q, v). The situation of 1, and the salt baths which were established lere in 1822, have attracted to it vast numbers of visitors. The emperor and many of the Austrian nobility have built villas here, and the town has also acquired celebrity from having been the veene of various diplomatic conferences. Pop., 3000.

ISEO, LARL OF LACUS SEVINUS, a lake of Northern IsbA, situated between the provinces of Bergamo and Bressia. Its extreme length from north to south is about 20 miles; its average breadth, 6 miles; and its greatest depth, 984 feet, On its banks is situated the town of 1seo. The lake is fed by the rivers Oglio and Borlazzo. The surrounding scenery is highly interesting, broken into picturesque heights, and studded with fine villas, rinevards, and olive-gardens.

ISERE, a river of the south-cast of France, rises in Savoy, at the western base of Mount Iseran, flows in a general south-west direction through Ravoy, and through the departments of Isera and Drome, and joins the Rhone 8 miles above Valence. Its cattrie length is about 190 miles, for the last 50 of which it is navigable, but not without difficulty, as its channel is interrupted by shoals and islands.

ISERE, a department in the south-east of France, is bounded on the N. and W. by the river Rhone, on the E. by the department of Savoie, and on the S. and S. E. by those of Drome and Hantes-Alpes. Area, 2078,799 acres, of which nearly a half is in arable land, and a fith in wood. Fop. (1866) 581,586. The surface is level in the ceeds south, where the secency is very imposing. Mount Olau, on the south-eastern border, is 12,664 feet high. The chief rivers, besides the Rhone, are the Isrc, from which the department derives its amane, and its affluents the Drace and Romanche. The department of 1. is one of the richest of Prance on mineral productions. Mines of iron, lead, copper, and coul are worked, and gold and siture of the standard of the second of the richest of 5324,000 galons are said to be produced annually. Arrondissements, Grenoble, La Tour-du-Pin, St Marcellin, and Vienne; capital, Gernoble.

ISERLO'HN, an important manufacturing town of Prussian Westphalia, is situated in a picture-sque and mountainous district, on the Baar, a tributary of the Ruhr, IS miles west of Arnsberg. The industry of L is chiefly directed to the manufacture of hardware of various kinds, especially of brass and bronze articles. Pop. 13,429.

ISERNIA (anc. Libernia, a city of the Samnites), a town of Naples, in the province of Molise, is situated in a commanding position on the creat of a hill, 24 miles west of Campobasso, and is surrounded by scenery of romantic beauty. The modern town consists chiefly of one long and narrow street, and is surrounded by walls. Among numerous other antiquities is a subternacan aqueduct, hevn in the solid rock, which still supplies one was a surrounded by the supplies of the surrounded by the surrounded by the surrounded of the surrounded of the surrounded by the surrounded by making the surrounded of the surrounded of the surrounded of the surrounded by the

I'SH1M, a river of Siberia, an affluent of the Obi (q v.).

I'SHMAEL (Heb. Yishmael, 'God will hear'), the first-born of Abraham, by Hagar, the Egyptian handmaid of his wife Sarah. His character is found foretold before his birth by an angel, who met Hagar sitting by a well in the wilderness on the way to Shur, whither she had fled to avoid the harsh treatment of her mistress: 'And he will be a wild [literally, 'a wild ass.'] man; his hand against every man, and every man's hand against hin; and he shall dwell in the presence of all his brethren's (Gen. xvi. 12). Expelled from his father's house, along with his mother, when he was about the age of 15, he went into the southern wilderness where he grew up to manhood, and became famous as an archer. Scripture represents I. in a not nufavourable light, and it was predicted that he should become a great nation. This 'great nation' is commonly believed to be the Arabian; and there is no good reason for doubting that at least the northern Arabs-the wild Bedomins who roam over the great wastes between the peninsula of Sinai and the Persian Gulf—may, to a certain degree, be the descendants of Ishmael. There is, however, not a shadow of reason, as all scholars now admit, for the notion that the founders of the great Joktanite and Cushite monarchies in the south of Arabia were of Ishmaelitic origin; and the description given in Scripture of the character and habits of I, and his descendants does not in the least apply to these monarchies. The Bedonins of Northern and Central Arabia, on the other hand, are full of Ishmaelitic traditions. Mohammed asserted his descent from I., and the Mohammedan doctors declare that Ishmael, and not Isaac, was offered up in sacrifice—transferring the scene of this act from Moriah in Palestine to Mount Arafát near Mecca.

I SIAC TABLE, a monument much esteemed and quoted by archivelogists previous to the discovery of hierochyphics, being a flat rectangular bronzeplate, inlad with niello and silver, about 4 feet 8 inches long, by 3 feet in height. It was sold by a soldier of the Constable de Bourbon to a looksmith, and bought of the same by Cardinal Bembo in the Constable of the Survey of the Constable of the control to a looksmith, and bought of the same by Cardinal Bembo in to Thrin, where it is now deposited. It to existis of three rows of figures of Egyptian deities and camblems. Its object was supposed to have been votive, or even to have been the nativity of the Emperor Trajan; but it is now recognised as a very late or spurious monument—Winckelmann, Op. iii. 13, v. 450; Wilkinson, Sir G., Mann. and Cust.

I'SIDORE OF SEVILLE (ISIDORUS HISPA-LENSIS), one of the most distinguished ecclesiastics of the 6th century. He is particularly remarkable as among the earliest representatives of the church of Spain, and of that great movement in the Western Church by which the doctrinal and moral system of Christianity was brought into harmony with the habits and institutions of those various races and nationalities which, by successive immigrations and wars, were eventually erected into the Hispano-Gothic kingdom, which exercised so powerful an influence on what is called Latin Christianity. He was born about 560 or 570, at Carthagena, where his father, Severianns, was pre-fect. Two of his brothers, Fulgentius and Leander, were, like himself, bishops, the first of Carthagena, the second succeeding himself in the see of Seville. The episcopate of L is rendered notable by the two half-ecclesiastical, half-civil councils of Toledo in 619 and in 633, which were held under his presidency, and the canons of which may almost be said to have formed the basis of the constitutional law of the Spanish kingdoms, both for church and for state, down to the great constitutional changes of

the 15th century. He also collected with the same object all the decrees of councils and other church laws anterior to his time. His death, which occurred in 636, forms one of the most remarkable scenes in early Christian history. When he became sensible of the approach of death, he summoned his flock to his bedside, exhorted them to mutual forbearance and charity, prayed their forgiveness for all his own shortcomings in his duty, and directed all his property to be distributed among the poor. His works, which are in the most various departments of knowledge theological, ascetical, liturgical, scriptural, historical, philosophical, and even philological-were first published in 1580; but the most complete edition is that of Arevali, 7 vols. 4to (Rome, 1797—1803). We are indebted to I, for many fragments of Greek and Latin authors, among the number several of whom hardly any other remains have been preserved.

ISIDO'RIAN DECRE'TALS, also called FAISE Decretats, a spurious compilation of the 9th c., which, by a singular combination of circumstances, obtained currency in the Western Church, and continued for several centuries to enjoy unquestioned authority. Up to the 9th c., the only authentic collection of decretals, that of Dionysius Exiguus, commenced with the decrees of Pope Siricius in the end of the 4th century. The so-called Isidorian Decretals stretch back through the predecessors of Siricius up to Clement himself, and comprise no fewer than 59 decrees or epistles anterior to the time of Siricius. In a later part of the Isidorian collection, moreover, are interpolated nearly forty similar documents, unknown till the time of that compilation. All these documents are presented not merely as authentic, but as the genuine productions of the particular popes to whom they are attributed. The subject-matter of these decretals is most diversified, comprising the authority and privileges of the pope, the whole system of the hierarchy, with the relations of its several orders to each other and to the common head. In all, there is a strong and systematic assumption of the papal supremacy; but it is at the same time more than doubtful whether the direct object of the author was the exaltation of the papal prerogative. It is much more likely that the object was to protect the rights of bishops against the arbitrary rule of the metropolitans. Dean Milman thinks it probable that the author believed that he 'was not asserting for Rome any prerogative which Rome herself had not claimed' (Latin Christianity, ii. 378). Catholic historians, indeed, go further, and while they admit and denounce the clumsy fraud, contend that the easy and universal acceptance which the decretals met, furnishes the strongest presumption that the discipline which they have elaborated and methodised, was already in full possession, although without the formal and written law which the daring adventurer attempted to provide in the decretals of the early pontiffs.

It is enrious that the author, the place, and the date of this singular forgery are still matter of uncertainty. It is certain that it did not come from Rome; and the most probable conjecture assigns its origin to Metz, at some time between the years 840 and 847. It was introduced under the name of Isidore of Seville, as a part of the gennine collection known as his, and was believed to have been brought from Spain by Riculf, the Archbishop of Mentz. It is hardly possible, in an age of discussion like ours, to doubt that, when the decretals first appeared, even the most superficial inquiry, or the slightest critical investigation of the historical sources, would have sufficed to detect the fraud. 'It is impossible,' says Dean Milman, 'to deny that

at least by eiting without reserve or hesitation, the Roman pontiffs gave their deliberate sanction to this great historic fraud; 'and yet it is equally impossible to fix the limit beyond which, in an age so uncritical, literary or historical credulity might not be carried without provoking its susceptibility,

or disturbing its peace.

From the first circulation of the false decretals down to the 15th c., no doubts were raised regarding them. Nicholas of Cusa and Cardinal Turrecremata were the first to question their genuineness, cremata were the first to question their genineness, but after the Reformation, the question was fully opened. The centuriators of Magdeburg demon-strated their utterly apocryphal character. A reply was attempted by Father de la Torre; but the question may be said to have been finally settled by Blondel.—See Milman's Latin Christianity, ii. 370-380: Walther's Kirchenrecht, p. 155; Gfrörer's Kirchengeschichte.

I'SINGLASS. See GELATINE.

I'S1S, the name of an Egyptian deity, the sister and wife of Osiris, called by that people Hes, daughter of Seb or Chronos, and Nu or Rhea; according to other versions, of Hermes and Rhea, according to other versions, of Hermes and Rhea, born on the 4th day of the Epagomena, or five days added to the Egyptian year of 360 days. After the murder of Osiris by Typhon, and the throwing of him in a coffia into the Tanitic mouth of the Nile on the 17th Athyr, I. was informed of the deed by the Pans and Satyrs, and went into mourning at Coptos; and hearing from some children where the chest had been thrown, proceeded to seek for it in company with Anubis, and discovered it enclosed in a tamarisk column in the palace of Malcander, at Byblos; and sitting down at a fountain in grief, was discovered by the ambrosial scent of her hair, and invited to the court by the Queen Astarte, to nurse her children. One of these she fed with her finger, and endeavoured to render immortal by placing him in flames, while she herself, under the form of a swallow, flew round the column and bemoaned her fate. Having obtained the column, L took out the chest of Osiris, wrapped it in linen, and lamented so deeply, that the youngest of the queen's sons died of fright. She then set forth with the chest and eldest son to Egypt, dried up the river Phædrus on her way, and direct up the river linearitis on her way, and killed with her glances the eldest son, named Maneros, who had spied her secret grief in the desert. Having deposited the chest in a secret place, she proceeded to Buto to Horus; but Typhon discovered the chest, and divided the body into 28 or 26 portions, and scattered it over the country. These the goddess again sought, and found, except the phallus, which had been eaten by fish; and wherever she found any of the limbs, she set up a tablet, or sent an embalmed portion, deposited in a figure of the god, to the principal cities of Egypt, each of which subsequently claimed to be the true birthplace of Osiris. After the battle of Horus and Typhon, I. liberated Typhon, and had her diadem torn off, and replaced by one in the shape of a cow. She was the mother of Haroeris by Osiris before her hirth, and of Harpocrates after the death of Osiris. She buried Osiris at Philæ. The monarch Rhampsinitus played at dice with her in Hades. Her soul was supposed to have passed into the star Sothis or Sirins. Her worship was universal throughout Egypt; she was particularly worshipped at Philæ and at Bubastis, where a special festival was celebrated to her; and her tears were supposed to cause the inundation of the Nile. Another festival was celebrated to her at the harvest.

In the monuments, she is called the goddess-mother,

the mistress of heaven, sister and wife of Osiris, and nurse of Horus, the mourner of her brother, the eye of the sun, and regent of the gods. In her terrestrial character, she wears upon her head the throne which represented her name; in her celestial, the disc and horns, or tall plumes. She is often seen suckling Horus; sometimes she has the head of a suckling Horus; sometimes she has the head of a cow, indicating her identity with the cow Athor, of whom the sun was born. Occasionally, she is identified with other female deities, such as Pasht. On her head, she wears the vulture symbol of maternity. Her attributes were assumed by the queens of Egypt, and Cleopatra sat and gave responses in the character of the youthful Isia.

The worship of L was introduced into Rome by Sulla (85 n. c) from Tithorea, and shared the fate of Sulla (85 n. c) from Tithorea, and shared the fate of Sulla (85 n. c) from Tithorea, and shared the fate of that of other Egyptian detities, being associated with that of Serapis, Anulus, and others, and the temples from time to time destroyed. It fourished under the Flavians and Hadrian. At this time, I was represented with a sistmun or rattle, a bucket, and represented with a sistmun or rattle, a bucket, and the second of the sistence of

of diseases.

The myth of I., as given by Plutarch, appears to be a fusion of Egyptian and Phenician traditions, and the cootened explanations offered by that writer and others shew the high antiquity and unintelligibility of her name. She was thought to mean the cause, seak, or the earth, to be the same as the Egyptian Neith or Minerva, and Athor or Venus; to be the Greek Demerter or Ceres, Hecate, or even Lobe the Greek Demerter or Ceres, Hecate, or even Lobe the Greek Demerter or Ceres, Hecate, or even Lobe the Greek Demerter or Ceres, India, and a temple at Pamer, be found of this goldiers, and a temple at Pamer, benefit of in the honour at Authorh. The representations of in the honour at Authorh. The representations of the honour at Authorh. The representation of the honour at Authorh. The representations of the honour at Authorh. ISKANDEROO'N, or ALEXANDRETTA, a secport of Asiatic Turkey, on the coast of Syria, is situated on a gulf of the same name, 60 miles west-northwest of Aleppo, of which it is the port. Its harbour is the best on the Syrian coast; but the town itself, though much improved within late years, is still poor and miscrable. In 1856, 392 vessels of 133,114 tons, and the value of whose cargoes amounted to upwards of a million sterling, entered and cleared the port. Galls, silk, cotton, and fruits are exported; and the chief imports are rice, corn, salt, and goods of British maunifacture. Pon 1000.

YSIA DE PINOS, an almost circular island, of 800 square miles and 900 inhabitants, is the largest of the numerous satellites of Cuba, lying off the south coast of the Queen of the Antilles, pretty nearly on the meridian of the capital, Havana. It is celebrated for its excellent climate, exuberant fertility, rich mines, and valuable timber.

ISLAM, or ESLAM (Arab.), the proper name of the Mohammedan religion; designating complete and entire submission of body and soul to God, his will and his service, as well as to all those articles of faith, commands, and ordinances revealed to and ordained by Mohammed the prophet (see Moras-Medankism). Islam, it is held, was once the religion of all men; but whether wickedness and isolatry came into the world after the murder of Abel, or at the time of Noah, or only after Amm Ibn Lohai, one of the first and greatest idolaters of Arabia, are moot-points among Moslim (a word derived from Islam) theologians. Every child, it is believed, is born in Islam, or the true faith, and would continue in it till the end were it not for the wickedness of its parents, 'who misguide it early, and lead it astray to Magism (see Gueers), Judaism, or Christianity.' See Molammer, Korak.

ISLAMABA'D. See CHITTAGONG.

ISLAND (Ang.-Sax. inland, 'properly, eye-land, a spot of land surrounded by water, as the eye in face of "bedgewood; Ice. ey, Dan. 6c meaning the face of "bedgewood; Ice. ey, Dan. 6c meaning the influence of Fr. ide, derived from Luthrough and sometimes as an island surrounded with water. New Holland is sometimes regarded as a continent, and sometimes as an island are more numerous than and to the eastward, islands are more numerous than anywhere else in the world. There, also, the largest largest islands in the world. There, also, the largest largest islands in the world are Holland, that largest islands in the world are Holland, the largest standard in the world are Holland, the summar, and Great Britain. Islands are often in groups, and when the number is great, the assemblage is called an archiplage. Some islands have the appearance of intimate geological connection with the continents near which they are situated, and some of such connection with each other that they seem as if they were the remaining parts of crudity forms and the with the continents sear which they are situated, and some of such connection with each other that they seem as if they were the remaining parts of crudity forms and the with a they seem as if they were the remaining parts of crudity forms and the with active volences; the other low and flat, formed of coral. See Coral Islands, the one mountainous, and often with active volences; the other low and flat, formed of coral.

ISLANDS OF THE BLESSED were, according to a very old Greek myth, certain happy Isles situated towards the edge of the Western Ocean, where the favourites of the gods, rescued from death, dwelt in joy, and possessed everything in abundance that could contribute to it.

I'SLAY, an island on the west coast of Scotland, belonging to the group of the Inner Hebrides, and to the county of Argyle, lies west of the peninsula of Kintyre, from which it is distant about 15 miles, and south-west of the island of Jura, from which it is separated by a strait called the Sound

of Islay. Greatest length, 24 miles sound collection of the Sound Collection o

I'SLINGTON, a suburh of London, but so closely

connected with it as to form part of it, is situated Island), one of the many islands which me off the two miles north of St Paul's. Pop. in 1841, 55,690; in 1851, 95,329; in 1861, 155,341. It is remarkable for the number of its religious, educational, and benevolent institutions.

ISMAI'L, a town and river-port of Turkey, in the principality of Moldavia, on the north bank of the principanty of xologavia, on the morth stank of the killa branch of the Danube, about 40 miles from the mouth of that river. It was taken, destroyed, and its garrison put to the sword by Suwaroff in December 1790; came into the possession of Russia after the peace of Bucharest in 1812; but reverted to Turkey by the treaty of Paris, 1856. It carries on an important trade in corn, as well as a considerable general trade. 270 vessels left the port with cargoes in 1858. Pop. (1856) 31,779. Previous to its reversion to Turkey, it was the station of the Eussian fleet of the Danube.

ISMU'D. ISMID, or IZMID. See NICOMEDIA. ISNI'K, or IZNECK. See NIC.EA.

ISOBAROME'TRIC LINES (Gr. isos, equal) are lines connecting together on a map those places which exhibit the same mean difference between the monthly extremes of the barometer. oscillations are greater in some countries, as Hindustan and Newfoundland, than in others, as Western Europe and the Autilles.

ISO'CHRONISM (Gr. isos, equal, chronos, time). A pendulum is isochronous when its vibrations are performed in equal times, whether these vibrations be large or small; but it can only possess this property by being constrained to move in a cycloidal arc. See Cycloid. This is managed by causing the string to wrap and unwrap itself round two equal cycloidal cheeks, the diameter of whose generating circle is equal to half the length of the Isochronism is closely approximated pendulum. in practice by causing the pendulum to describe a very small circular arc.

ISOCRATES, a celebrated Grecian orator, was born at Athens, 436 B.C. He had a weak voice, and much natural timidity, which shut him out from a political career; but he taught rhetoric, and wrote orations for others, for which he received large sums; and though he did not mingle in the strife of parties, he was earnestly interested in the The fatal battle of Cheroneia broke his heart : he refused to taste food, and died after an abstinence of several days, 338 B.C., in the 98th year of his age. I. was a friend of Plato. His orations, of which unwards of twenty are extant, are characterised by extreme carefulness and elegance of style, but are not to be compared with those of Demosthenes in fervour, or with those of Lysias in natural beauty and simplicity. The best modern editions are those of Lange (Halle, 1803), Ad. Coraes (Paris, 1807), G. S. Dobson (Lond. 1828), and Baiter and Sauppe (Zurich, 1839).

ISODYNA'MIC, ISOCLI'NIC, and ISOGO'NIC LINES (Gr. isos, equal, dynamis, force, klino, to hend, go :ia, an angle), or lines of equal force, equal inclination, and equal declination, are three systems of lines, which being laid down on maps, represent the magnetism of the globe as exhibited at the earth's surface in three classes of phenomena, the varying intensity of the force, the varying dip or inclination of the needle, and its varying declination from the true meridian. See MAGNETISM.

ISO'LA BE'LLA. See BORROMEAN ISLANDS.

western coast of Dalmatia, in the Adriatic Seu, extends between 43° 51' and 44 11' N. lat. Greatest length, 27 miles; greatest breadth, 3 miles; pop.

ISOLA MA'DRÉ. See BORROMEAN ISLANDS.

ISO'MERISM (from the Greek word someres, composed of equal parts), a term applied to those organic compounds which are identical in their ultimate or percentage composition, but present differences in their chemical properties. Isomeric compounds, or isomerides, are divisible into metameric compounds, or metamerides, and polymeric compounds, or polymerides.

In all metameric compounds, the equivalent number is the same, while in all polymeric compounds the equivalent numbers are simple multiples of the equivalent of the lowest number of the group. As an illustration of metamerides, butvric acid, $C_4\Pi_7O$ $O = C_4\Pi_8O_2$, and acetic ether, $C_2\Pi_5O$ O =

C4HaO2, may be taken. Their rational formula, which express their probable constitution, are perfectly distinct, yet it will be at once seen that they have the same empirical formula (C4IIsO2), and consequently the same percentage composition, and the same equivalent number, viz., 88,

As an illustration of polymerides, the hydrocarbons homologous with olefiant gas may be taken. Olefiant gas is represented by the formula C2 II4, tritylene by C₃H₆, butvlene by C₄H₈, amvlene by C₅H₁₀. These substances have the same percentage composition, but different equivalent numbers, all the formulæ being multiples of the more simple formula, CH2, which represents the composition of an alcohol-radical, methylene, which has not yet been iso-

The carbo-hydrates, which are represented by the general formula, CxHn2On, present well-marked examples of isomerism. Thus, cellulose (CellinO5), starch (Cell10()5), and gum (Cell10()5), are metameric; while grape-sugar (C6H12O8) possesses the same percentage composition, but twice as high an equivalent number, as hydrated lactic acid (C3HsO3), and the same percentage composition, but three times as high an equivalent number, as hydrated acetic acid (C2114O2); hence the three last-named substances are polymeric.

ISOMO'RPHISM (derived from the Greek words ison, equal, and morphe, form) strictly signifies similarity of form, but it is now restricted by chemists to those substances which are not only similar in their crystalline form, but are also analogous in their chemical composition. The diamond (C), magnetic oxide of iron (Fe₂O₂Fe₄O₅), and alum (AlK(SO₄)².12H₂O), all crystallise in octahedra, but there is obviously no analogy in the chemical composition of these substances; on the other hand, the spinelle ruby (Mg2O.Al4O3), magnetic oxide of iron (Fe₂O.Fe₄O₃), and chrome ore (Fe₂O.Cr₄O₃), not only crystallise in octahedra, but (as their formuke shew) are also analogous in their chemical composition. Hence, the members of the latter group are truly isomorphous in the restricted sense, while the members of the former group present only one of the combinations of chemical isomorphism. In most cases, however, as Mitscherlich (to whom we owe much of our knowledge of this subject) has shewn, the chemical composition of substances that correspond in form is analogous; and that chemist has further endeavoured to prove that crystalline form is independent of the chemical mature of the atoms, and that it is determined solely ISOLA BELLA. See BORROMEAN ISLANDS. by their grouping and relative position; the same way ISOLA GROSSA, or LUNGA (Great or Long number of atoms combined in the same way always producing, as he asserts, the same crystalline groups in which the existence of isomorphism has form.

Miller, in his Chemical Physics, gives fifteen three groups—one of elements, and two of compounds:

Arsenic Antimony Tellurium Chloride of Potassium, KCl | lodide of Potassium, KI Bromide of Potassium, KBr Fluoride of Potassium, KFl

Al₄O_a 'Alumina. Sesquioxide of Iron. Fe O Sesquioxide of Chromium, Cr.0. Scsquioxide of Mangauese, Mn. O.

The discovery of the coincidence of similarity latitude, descends to near the latitude of New York. in crystalline form where the chemical composition is also similar, is the most important generalisation yet arrived at in the science of crystallography; and in chemistry it has been of essential service in facilitating the classification of compounds, and in determining the combining numbers or atomic weights of the elementary bodies.

ISO'PODA (Gr. equal-footed), an order of Malacostracous Crustaceans of the section Edriophthalma (q. v.), mostly aquatic-some marine, some inhabitants of fresh waters—but some terrestrial, inhabiting damp places, as the armadillo, woodlouse, &c. The body is flattened. The thorax consists of seven segneuts bearing seven pair of feet—six in the young before their first moulting. The females have usually large plates attached to the thoracic segments, meet-

ing to form a pouch for the eggs and young.

The interesting fossils called Trilobites (q. v.) are

supposed to be Isopoda, or nearly related to them. ISOTHE'RMAL LINES (Gr. isos, equal, and thermos, warm) are lines laid down on maps to connect together places of the same mean temperature.

—Isotheral Lines (Gr. theros, summer) are those which connect places of equal mean summer temperature.—Isocheimonal Lines (Gr. cheimon, winter) connect places of equal mean winter temperature.-Alexander von Humboldt was the first to lay down these systems of lines on maps in 1817. Their importance in reference to climate, meteorology, and the geographic distribution of plants and animals, can hardly be over-estimated.—If the whole surface of the earth were uniform, it is evident that isothermal lines would precisely correspond with the degrees of latitude, and there would be no isotheral and isocheimonal lines, as distinguished from the isothermal; but neither would the earth be habitable for man, or suitable for almost any of the animal or vegetable tribes which actually exist upon it. Isothermal, isotheral, and isocheimonal lines are therefore laid down altogether from observations recorded and compared. In laying them down, care must be taken to make allowance for the elevation of each place of observation above the level of the sea, they being all laid down as for that level Isothermal lines are named according to the mean temperature which they indicate, the line of 50°, the line of 60°, &c. They are far from corresponding with parallels of latitude, nor are they parallel with one another, but are curved in such a manner as to indicate two northern and two southern poles or centres of greatest cold. It is in the extra-tropical parts of the northern hemisphere that these curva-tures are greatest. The northern poles of cold are situated in the arctic regions, one to the north of Siberia, nearly in the meridian of Jakutsk, and the other to the north of America, nearly in the meridian of the most western part of Hudson's Bay; and the isothermal lines throughout the greater part of the northern hemisphere descend to a lower latitude in the east of Asia and in the east of America than elsewhere, ascending, however, to a comparatively high latitude on the western coasts of both the great continents. Thus, the line of 50° F., which cases through the north of England and the north of Ireland, and there reaches its most northern

on the eastern coast of America. The distances of the isothermal lines are also remarkably various in different parts of the world. Thus, in the east of North America, from Charleston to Labrador, the mean annual temperature varies more than a degree and a half for every degree of latitude; whilst in Central Enrope the variation is only about ninetenths of a degree, and on the western coasts of Europe still less.

The isotheral and isocheimonal lines are neither parallel among themselves nor with the isothermal lines, and it is in this that a chief difference of continental and of insular climates appears, the summers of the former and the winters of the latter enjoying comparatively large proportions of the heat of the

Another interesting system of lines relative to temperature has been laid down by Mr Dove, which he calls Labnormal Lines—the term, however, is objectionable, as formed from words of two languages—lines connecting places which have the same excess above or defect below the normal mean temperature of their latitude. See CLIMATE, METEOROLOGY, and PHYSICAL GEOGRAPHY.

ISPAHÂ'N, properly ISFAHÂN, a famous city of Persia, capital of the province of Irak-Ajemi, and formerly capital of the entire country, is situated on the Zenderud, in an extensive and fertile plain, 226 miles south of Tehran; lat. 32° 40' N., long, 51° 43' E. The Zenderud is here 600 feet broad. of 45 E. The Zenderud is here 600 feet broad, and is crossed by three noble bridges, one of them 1000 feet in length, and having 34 arches. Groves, orchards, avenues, and cultivated fields surround the city for miles; but the permanent beauty of the vicinity only serves to make the contrast all the more striking between the former splendour of the city and its present ruinous condition. Miles of street are now almost tenantless, and many of the palaces are deserted, and rapidly falling to decay. palaces are deserted, and rapidly failing to decay, In the Chubert Bugh, an extensive pleasure-ground on the south of the city, is a palace called the Chube Stuton, or "Forty Columns," once a favourite royal residence. Along the front of this palace is a double range of columns, each rising from the backs of four bons in white marble. The pillars are inhald with mirrors, and the walls and roof are profusely decorated with glass and gilding. The suburb Julfa, on the southern bank of the river, once a flourishing Armenian settlement of 30,000 inhabitants, is now little better than a mass of ruins. I, however, is still an important city, and the seat of extensive manufactures, including all the seat of extensive manufactures, incuming assorts of woven fabrics, from rich gold brocades and figured velvets to common calicoes. Trinkets and ornamental goods in great variety, with fire-arms, swort-blades, glass, and earthenware, are also manufactured. Many of its bazaars are still advantaged to the common statement of the common sta crowded daily, and its merchants are still influential enough to affect prices in India. Of late years, too, I. has shewn considerable signs of improvement; many of its edifices have been rebuilt; rice, an important article of commerce, is now largely cultivated in the neighbourhood. Pop. estimated at 60,000.

I. was a trading town of importance, and the

capital of Irak, under the califs of Bagdad. It was taken by Timur in 1387, when 70,000 of the inhabitants are said to have been massacred. During the 17th c. under Shah-Abbas the Great, it became the capital of Persia, and reached the climax of its prosperity. Its walls were then 24 miles in circuit, and it is said to have had between 600,000 and 1,000,000 inhabitants. It was then the emporium of the Asiatic world: the merchandisc of all natious enriched its bazaars, and ambassadors from Europe and the East crowded its court. In 1722, it was devastated by the Afghans, and some time afterwards the seat of government was transferred to Tehran (q. v.).

I'SRAEL, KINGDOM OF. See JEWS.

ISSOIRE (ane. Issiodurum), a town of France, in the department of Puy-de-Dome, at the confluence of the Couze and Allier, 20 miles south-east of Clermont. Pop. 6000.

ISSOUDUN, a manufacturing town of France, in the department of Indre, is situated on the river Théolle, on the railway from Orleans to Limoges, 18 miles north-east of Châteauroux. The principal manufactures are woollen cloth and yarn.

ISSUE, in Law, means the point of fact in dispute which is submitted to a jury.

ISSUS, anciently, a seaport on a gulf of the same name in Cilicia, Asia Minor, celebrated for a victory which Alexander the Great obtained here over Darius (333 B.C.), by which the camp and family of Darius fell into his hands. Its exact site has not been ascertained.

ISTALI'F, a town of Afghanistan, situated 22 miles north-north-west of Cabul, on a tributary of the Cabul river. In 1842, it was partially destroyed by the British. Previous to that event, it had 15.000 inhabitants, who were employed chiefly in spinning, weaving, and dyeing cotton.

I'STHMUS (Gr.), in Geography, a narrow neck of land joining two portions of land. The name isthmus was by the ancients often employed without any addition to designate the 1sthmus of Corinth, joining the Pelopounesus to continental Hellas. Here there was a famous temple of Neptune, and here also were celebrated the ISTHMIAN GAMES (one of the four great national festivals of Greece), at first every third year, and afterwards every fifth year. They were said to have been originally instituted by Sisyphus, and afterwards restored by Theseus. The games, like those of Olympia, consisted of athletic exercises, with the addition of competitions in music and poetry. The victors were crowned with garlands of fir, and their statues were placed in the temple of Neptune. Down to the destruction of Corinth by the Roman general Mummius (146 B.C.), the management of these games was in the hands of the rulers of that city, though the Athenians always enjoyed the seats of honour. The Romans added the coarser and more brutal amusements of gladiatorial exhibitions and The spread of Christianity was fatal to their popularity, but we still read of them in the reigns of Constantine and Julian

I'STRIA an Austrian margraviate, which, with the county of Görz and Gradiska, and the town and territory of Trieste, forms the Austrian crownland of the coast-districts or Küstenland. consists of a pennsula projecting into the northadjacent Quarnero Islands.

ISVORNIK. See ZVORNIK.

power, hence literally, lord) is an epithet applied to different Hindu divinities, but in mythological acceptation mostly designates S'IVA (q. v.).

ITA'LIAN ARCHITECTURE. This term is usually limited to the style practised by the Italian architects of the 15th, 16th, and 17th centuries, and which has since been adopted in every country in Europe. This style originated in a revival of the accient architecture of Rome. Although Gothic architecture had been practised in Italy during the 13th and 14th centuries, it had never been thoroughly naturalised. The Italians always shewed a preference for the round arch over the pointed northern form; and even in the buildings they erected in the pointed style, there is a certain simplicity and largeness of parts indicative of a classic feeling As early as 1350, Giovanni Pisano, in the beautiful sculpture of the pulpit at Pisa, shewed a return to the ancient models. Arnolpho di Lapo built the cathedral of Florence (1290-1300), and in his design, proposed a great dome (a remarkably Roman feature) over the crossing of the nave and transept. This he did not live to complete; but he prepared the way for Brunelleschi, the chief aim of whose life was the accomplishment of the great dome of the cathedral. He went to Rome to study the ancient buildings there, at that time neglected and hardly known to the Italians themselves. After devoting a considerable time to exploring these monuments, he returned to Florence; and, after

Library of St Mark's, Venice, Ricardi Palace, Florence, by Michelozzo.

great opposition, succeeded in earrying out the construction of the dome as it now stands. From this time, the revival of Roman architecture went on ISWARA (from the Sanscrit &, to possess rapidly. It was encouraged by the popes and other princes of Italy; and the invention of the printing-press soon spread a knowledge of the works of the Italian architects over Europe. At first, the Roman ratina architects over curope. At first, the roman mouldings and ornaments only were copied and applied to the existing forms. As the ancient style became better understood, its general principles were gradually adopted, until at length the Modern Italian style was formed. This style may be defined as ancient Roman architecture applied to the forms and requirements of modern buildings. It has been admirably applied to domestic, but it has never been so successfully used in ecclesiastical, edifices. The domes of the Italian churches render the interiors of these buildings very impressive and are a feature, for the introduction of which into the west of Europe, we are indehted to this style; but the façades of the churches are broken

up into stories, and want the unity of a Gothic front.

Italian architecture is divided into three styles or schools, according to the places where it was practised-viz., the Florentine, Roman, and Vene-The Florentine buildings are massive and grand in effect ; they are indebted to ancient Roman grand in effect; they are underted to allocate rooman art chiefly for details, the outlines being the same as those of the older buildings, formed to suit the requirements of the place. Florence being a turbu-lent city, every man who had anything to lose had literally to make his house his castle. Accordingly, the basement floor is massively built with large blocks of stone, and the windows are small and plain. The Roman school naturally resembles more closely the ancient Roman buildings so numerous in that city—pilasters, arcades, &c., heing freely used. In Rome, the plan of including two or more stories in one order of columns or pilasters with their entablature, with an attic or low story above, first originated, and was afterwards extensively, but, as already explained, not successfully applied to

The Venetian style is, as might be expected in a city long accustomed to elegant palaces, the most ornate and picturesque of the Italian schools. Venice is crowded with specimens of all kinds from the earliest to the latest renaissance, and retains its individuality of style from first to last. Each story is marked by a separate tier of columns or pilasters with their entablature; the windows are arched and ornamented with columns, and the spandrils commonly filled with figures. The outline is varied in form, and is usually finished with a balustrade, broken by pedestals, and crowned with sculp-tured figures. It is from this most picture-sque of the styles of the Italian renaissance that the other countries of Europe derived their peculiar forms. See ERNAISSANCE, ELIZABETHAN, CINQUE-CENTO.

ITA'LIC VERSION (Vetus Itala), the name given to a translation of the Scriptures into Latin, which preceded the Vulgate. Its origin is commonly supposed to date from the middle of the 2d century. The Italic Version was in general use down to the time of Jerome, who, being dissatisfied with the imperfections which it exhibited, under-took to revise and amend it, but ultimately produced the new translation known as the Vulgate (q. v.). The Italie Version of the Old Testament was made, not from the Hebrew, but from the Septuagint.

I'TALY. The geographical territory comprised under the name of I, consists of a considerable stretch of peninsular mainland, closely resembling a boot in shape, besides several islands, situated in Southern Europe, between lat. 36° 35′ and 47° N., and between long. 6° 35′ and 18° 35′ E. From the southern extremity of Sicily to the Alps its maximum length is about 600 miles, its utmost breadth being 300 miles.

Boundaries. - Its boundaries on the N. are Austria and Switzerland, on the S. the Mediterranean, on the W. France and the Mediterranean, and on the E, the Ionian and Adriatic Seas, while its natural limits are strongly defined by the Alps and the sea.

Area.—The kingdom of Italy, which now comprises the entire peninsula and several adjacent islands, except the unimportant principality of Monaco and the Republic of San Marino, embraces a total area of 114,629 English square miles, and a population of 24,965,882. It is composed of the following provinces:

Grand Total Kingdom of Italy,	111,629,61	24,965,882

The estimated population of several of the provinces of the K, of Italy on the 1st of Jan., 1870, was as follows: Piedmont and Liguria, 3,788,974; Lombardy, 3,296,610; Venetia, 2,718,633; Emilia, 2,121,653; Abruzzo and Molise, 1,280,440; Campagna, 2,753,555; Sicily, 2,512,124; Calabria, 1,998,279; and the entire

The Kingdom of Italy owes its present extensive limits to the voluntary annexation of several states to the Sardinian monarchy, the whole being now governed by Victor Emanuel, a constitutional sovereign of the House of Savoy. The present capital is Florence, but the title will shortly be restored to Rome. By the incorporation of these numerous states into one sovereignty they have conjointly attained to a European rank from which they were excluded as separate autonomies.

The Venetian States were annexed by treaty with Austria, Oct. 3, 1866, and the Papal territories not already absorbed became provinces of the K. of Italy on Oct. 2, 1870, when 'the despotism of a thousand years fell at a touch in noiseless rottenness, the people of Rome, 50 to 1, easting their ballots of condemnation like so many shovelfuls of earth upon its grave.' Victor Emanuel, welcomed as a deliverer, entered Rome in trinoiph on the last day of 1870.

Physical Aspect.-The physical aspect presented by the surface of I. is diversified in the extreme. Northern I. is, for the most part, composed of one great plain—the basin of the Po, comprising all Lombardy and a considerable portion of Piedmont and Venice, bounded on the north-west and partly on the south by different Alpine ranges. Throughout Central I., the great Apennine chain gives a picturesque irregularity to the physical configuration of the country, which in the southern extremity of I. assumes still wilder forms. In the high-land districts of Naples, in which the Apennine ridge reaches its maximum elevation (10,000 feet), the scenery exhibits a savage grandeur. Along the extensive coast-plains, as well as in the sub-Apennine valleys, the rural charms of this portion of L. are extreme, while the brilliant flora and vegetation impart to it a novel character of beauty. The chief mountain system of I, is the frontier-ridge of the Alps (q. v.), and its noble continuation the Apen-

l'olcanic Zone.-I. likewise comprises a considerable stretch of volcanic zone, which traverses the peninsula from the centre to the south in a parallel line with that of the Apennines, and of which the most remarkable active summits are Vesuvius, adjoining Naples; Etna in Sicily; and Stromboli

in the Lipari Isles.

Plains, - The great plains of 1, are those of Profax.—The great plains of 1. are those of Lombardy, which stretch from the Mineio to the Teino and the Po₂ of Piedmont; the Venetian plains; the plain of the Roman legations; the plain of the Campo Felice, on which stands Venetius; the Apulian plain; the long, narrow Nexpolitan plain of the Basilitata, 100 miles in length, and 24 miles in breadth, stretching along the Gulf of

Rivers.-The great majority of the rivers of I. are only navigable for small coasting boats or barges. By far the most important is the Po (q. v.), which rises on the borders of France, and flows into the Adriatic. It has numerous tributaries. Among the Author. It has admerous tributaries. Among the others may be mentioned the Adige, Brenta, Piave, Tagliamento, Aterno, Sangro, Metauro, Ofanto, Bradano, also belonging to the Adriatic basin; the Arno, the Tiber, the Ombrone, the Garigliano, and the Volturno, which belong to the Mediterranean basin. The classical and historical associations of many of the Italian streams, even when mere rivulets, invest them with perennial interest.

Canal System .- The canal system of I. is most extensive in the north. Nine principal canals in Lombardy administer to the irrigation of the plains and to the purposes of commercial communication, contributing in no small degree to the prosperity of The Naciglio Grande or Ticinello is the district. the finest hydraulic construction in 1.; it communicates between the Ticino and Milan, and has a course of 28 miles navigable for vessels of large size. It was begun in 1179. The Naviglio Martesana, 38 miles long, unites Concesa on the Adda with Milan; the Naviglio di Pavia is 18 miles in length; the bifurcated Naviglio d'Ostiglia unites the Po with the Adige. 253 canals intersect Piedmont, extending over a length of 1932 kilomètres. Venice comprises 203 navigable, and 40 minor canals. Numerous canals have been constructed for the drainage of the Pontine Marshes. This system of water-communication was early carried to a high degree of efficiency in L, and is of incalculable service in the agricultural districts.

Lakes.-The mountain lakes of I. are famed for their picturesque beauty. They are mostly in the northern provinces of Lombardy and Venetia. The are Maggiore, Lugano, Como, Iseo, and Garda. The Roman lakes of Perugia, Bolseno, and Bracciano, that of Castiglione in Tuscany, and Celano in Naples, also deserve mention.

Springs.-The mineral and thermal springs of I. are innumerable, and possess a great variety of

curative and sanitary properties.

Climate.—In the northern provinces, the climate is temperate, salubrious, and frequently severe in winter: in the centre, it assumes a more genial and sunny character; while the heat of the southern extremity is almost of a tropical intensity. singular clearness of the atmosphere sets off the landscape and monumental beauties of I. with brilliant effect. The drawbacks of I.'s climate are the piercing tramoutana or mountain winds: the deadly sirocco, which blights all nature at seasons along the western coast; and the malaria or noxious miasmata which issue from the Maremma of Tuscauy, the Pontine Marshes, and the Venetian lagoons, generating pestilential fevers and aguish diseases in the summer season. The mean temperature of the leading divisions of the country throughout a whole year was as follows: Milan, 55° 4° of Fahrenheit's scale; Rome, 59°; Palermo, 62° 5'; and in Sardinia, 60° 5'. The highest temperature at Rome rises to 95°, and in Sicily from 97° to 104°.

Products. - The staple products of I. are corn, wine, oil, raw silk, rice, olives, and fruits, besides

hcmp, flax, cotton, which are largely grown, and even the sugar-cane is successfully cultivated in the Two Sicilies. Agriculture, however, except in the north, is in a very backward condition. Nevertheless, the annual yield of cereal crops is considerable, less, the annual yield of cereal crops is considerable, and not only suffices for home consumption, but likewise for foreign export. The northern provinces or great plains, Tuscany, and the islands of vinces or great plains, Tuscany, and the islands of Sardinia and Sicily, furnish most of the grain of Italy. The minor alimentary products are heans, pease, Indian corn, lupines, and chesnuts, which are largely used. The wines of L are very numerous, but owing to the defective mode of their manufacture, are unfit for exportation, as they can neither bear transport, nor do they improve by age. The wines of Naples are esteemed the best, well unastitude of the famous Lorging (Christ and small quantities of the famous Lacrima Christi and the Vino d'Asti being exported, while the Sicilian wines of Marsala form a considerable export trade. The most superior oil and olives are furnished by The most superior on and drives are turnished by Tuscany, Lucca, and Naples; the oil of Florence, and that of Gallipoli and Puglia, being unequalled for purity and sweetness. Silk is chiefly manufor purity and sweetness. Silk is canely manu-factured in the northern provinces, the cultivation of the mulberry and the rearing of the silk-worm forming in Lomhardy a principal occupation of the population. In Lomhardy alone, upwards of 17,000,000 mulberry-trees are required to furnish food for the worms; and the silk exported from the Lombardo-Venetian provinces alone an annual revenue estimated at about £7,000,000. The best manufactured silk comes from Piedmont, The best manuactured size comes from Fleenman, Tuscany, and the Roman provinces. The cotton-plant is grown extensively in Sicily, and yields annually about 2,000,000 lbs., which is manufactured in the native looms of Tuscany, Piedmont, Lomhardy, and Rome. The fruits of the Two Sicilies are exquisite in flavour, and embrace several tropical species. Oranges, lemons, almonds, figs, dates, melons, and the pistachio-nut are common to all orchards, and are largely exported. A considerable cheese-trade exists in the northern provinces. that of Lombardy alone yielding a revenue of more than £2,000 000. I. also furnishes various valuable substances, such as sulphur, alum, &c. All the substances, such as support, alum, &c. All the domestic animals of Western Europe are to be found in I, besides buffalces and camels, which are not uncommon. The fauna of I includes most of the uncommon. Ine tauna of I. meludes most of the British species, besides the wolf, lynx, boar, marmot, vulture, bis, flamingo, and pelican. On the coast of the southern provinces are to be found many species of African water-fowl. The ortolano and become on small birds, much esteemed for their flavour. The nocturnal fireflies are a remarkable feature of incept 16. feature of insect life.

Fisheries.—The sea and fresh-water fisheries of I. are considerable; the Mediterranean furnishing immense quantities of tunny, anchovies, sardines, mullet, pilchards, and mackerel. The export of anchovies and sardines is of vast extent. The river-fisheries yield salmon, trout, sturgeon, lampreys, tench, and barbel, &c.; and the lageons contain excellently flavoured cets. See Commaccino. The crustaceans and shell-fish of the Italian seas are of great variety and delicate flavour, and are a

Exports.—Among the exports of I. may be noted raw silk, rice, fish, fruits of various kinds, marble, alabaster, sulphur, alum, silks, velvets, cloth of gold and silver, perfumes, mosaics in stone and wood, and silver, perfumes, mosaics in stone and wood, carvings in wood, macaroni and similar culinary pastes, porcelain, majolica, preserved fruits and meats, musical instruments, jewellery, and objects

14,797 officers, and consisted of 94,800 infantry of the line: 13.830 Bersaglieri, or sharp-shooters; 14,326 cavalry; 15,597 artillery; 2320 engineers; 1127 military train; 19,509 carabinieri; 2300 administrative troops; 700 military instructors. The total number of troops on the war-footing numbers 546,442 of all ranks. At the beginning of 1870 the Italian pavy was composed of 91 ships of war, armed with 798 guns: of these, 22 were iron-clad steamers, of 201 guns; 29 screw steamers, of 380 guns; and 32 paddlewheel steamers, of 113 guns; 8 sailing vessels, of 104 guns, the whole manned by 20,892 sailors.

Finances.-The budget for the year 1870 gave a total ordinary income of about \$178,000,000, and from the property of the Church \$190,000,000. The expenses property of the Church \$190,000,000. The expenses of all kinds amounted to \$223,000,000. The interest on the public debt in 1870 amounted to 467,314,812 francs.

Religion.-The dominant form of religion of L is the Roman Catholic. The native Protestants dwell chiefly in the Waldensian valleys of Piedmont, and number only about 20,000. There are also between 40,000 and 50,000 Jews scattered throughout L, who are chiefly engaged in commerce. Political rather are chienly engaged in commerce. Fortical rather than theological reasons have recently, however, brought the papacy into great disrepute among the progressive and national section of the country. Freedom of worship, until of late, was denied to native Protestants by all the states except Piedmont; but since the late political changes of I., freedom of religious belief is not only tolerated, but promoted and encouraged by the government. Roman Catholic clergy are estimated at about 500,000, including the monastic fraternities. The church revenues of L have of late suffered considerable diminution, owing to the suppression of several orders and the confiscation of their property, which has been devoted to the cause of public education.

Education.—The mass of the Italian people are incredibly illiterate; the primary elements of education, reading and writing, are by no means universal even among the better classes. A great educational impulse, however, has been imparted to all the recently united states, in which new public and endowed schools are daily being inaugurated. Normal schools, on the British principle, have been already founded for the training of I.'s future teachers; and the judgment, tolerance, and discrimi-nation displayed in the various appointments to nation displayed in the various appointments to these institutions, give the happiest promise for the future education of Italy. The universities of L are numerous, many of them being of ancient date and European fame. The chief are those of Salerno, Bologan, Naples, Padua, Rome, Perugia, Pian, Siena, Pavia, Turin, Parma, Florence, Catania, Caglian for 1741 (Lunes Franchalled) and artestic for the chief. in 1764), Genoa (remodelled and extended, 1783), Modena (recently reopened). See Venetia, Papal States, Monaco, Marino.

History.-The ancient history of I. will be more History.—The ancient history of 1. With ce more conveniently treated of under ROME; see also ETERHA, UMERIA, &C. We proceed to the dawn of modern history. The Western Roman Empire fell before a mixed horde of barbarous mercenaries heliefly composed of the Heruli, who proclaimed their leader, Odoscer, king of Italy (476 A. D.) Afras 12 waves of militarevicensitism he was slain. their leader, Jooseer, king of Italy (470 A.B.). After 13 years of military despotism, he was slain, and his followers vanquished by the Ostrogoths, led by their great king Theodoric. The Ostrogoths (see Goths), in their turn, were vanquished (552 A. D.) ; and I. was then governed by an exarch, or delegate of the emperor of Constantinople, whose seat of government was Ravenna. Narses, the first exarch, having been disgraced, in revenge invited the Lombards to pastes, porceaus, majories, preservoir trutts and near their rule to accide the second instruments, evellery, and objects invaside luly (588); and under their rule the ancient of art.

Army and Navy.—On Jan, 1, 1810, the army was been composed of 138,644 men on the peace-footing, and the composed of 138,644 men on the peace-footing, and the composed of 138,644 men on the peace-footing, and the composed of 138,644 men on the peace-footing, and the composed of 138,644 men on the peace-footing and t

by Pepin (754) and Charlemagne (774), the latter of whom was crowned emperor of Italy. The Lombards, however, retained the great duchies of Benevento, Spoleto, &c., till the advent of the Normans. In 842, the Saraceus invaded L, and took possession of many important places on the southern coast, which they held till 1016, when they were driven out by the Normans. On the fall of the Carlovingian dynasty (888), the crown of Italy fell to Berengarius L, chief of the Friuli, whose descendant, Berengarius II., did homage to Otho I. of Germany as his lordparamount (951); and in 961, Otho deposed his vassal, and assumed sovereign rights over the Italian kingdom. From this period, the chief towns of Italy rapidly emerged from their previous insignificance. A foremost object of Otho and his successors was the abasement of the papacy; and for a time these emperors successfully arrogated to themselves the right of nominating to the chair of St Peter the occupant most attached to imperial rule. The accession of Konrad was the signal for various tumultuons risings of the Italians against their German rulers, who had grown the object of general detestation. Important feudal modifications during this reign tended still further to weaken the great feudal lords, and to exalt the inferior vassals and citizens. Under the reign of his successor, Henry III., we find the spirit of association, alike for offence or defence, waxing strong in Italy. The aggrandisement of the great Guelphic House of Este (q. v.), the bloody wars of the Investiture (q. v.), and the establishment of an ameliorated form of municipal government (1100), are the three most notable events that occurred under the Franconian

Under the Hohenstaufen dynasty, Italy enjoyed an interreguum from foreign rule of about 60 years, which, however, was wasted in suicidal con-flicts between the two factions of the Guelphs and Ghibellines. The most terrible incident of this period was the massacre of the Sicilian Vespers (q. v.). Notwithstanding the inveterate internecine feuds of Italy, it was a period of great splendour and prosperity. The free cities or republics of Italy rivalled kingdoms in the extent and importance of their commerce and manufactures, the advancement of art and science, the magnificence of their public editices and monuments, and the prodigious individual and national wealth to which they attained. Unhappily, a spirit of rivalry and intolerance grew np during this period of medieval splendour, and in the arbitrary attempt of these states to secure supremacy over each other, they

gradually worked their own destruction. From the Sicilian Vespers (1282) to the reign of Henry VII. (1308), the chief historical incidents are the war between Genoa and Pisa, ending in the abasement and ultimate decline of the latter (1284); the quarrels of the Guelphic factions, the Bianchi and the Neri, in Tuscany; the papal efforts for their reconciliation (1301); the residence of the popes at Avignon (1304-1377); and the rise into importance the first half of the 14th c., the German emperors made several fruitless attempts to regain political supremacy in I.; but in 1355, the Emperor Charles

V. gave up the struggle.
The tyraonical rule of several petty tyrants, of whom the foremost were the Viscouti or lords of Milan, replaced that of the emperors. From the middle of the 14th c. to the end of the 15th, the collective history of I. ceases, each city being ruled by some powerful local family—as, for example, by some powerful local lamity—as, for example, Verona by the Della Scala, Padua by the Carrara, Ferrara by the Este families, and Mantna by the illustrious princes of Gonzaga; Milan by the Della

Torre, Visconti, and Sforza families. See also

Genoa, Pisa, Florence, Venice, Naples, &c. From 1495 to 1525, I. was the theatre of the sanguinary struggles between France, the native rulers, and the Hapsburgs, but the battle of l'avia (1525) thoroughly established the ascendency of the German emperor, who appointed over the various states rulers of his own selection. During the 17th c., no events of note mark the history of I.; the country being at peace, the various states pursued commercial traffic and industry, as far as their decreased limits permitted. In the following century, some territorial changes were effected during the war of the Spanish Succession. In 1793, I. partially entered the European coalition formed against France, whose arms, however, proved irresistible. By the treaty of Campo Formio, 17th October 1797, the entire state of Venice was rransferred to Austria, while the rest of the country, under various designations, became for the most part a dependency of France. In this anomalous condition it remained during the rule of Napoleon. After the battle of Waterloo, the final reconstitution of I, was decreed as follows by the congress of Vienna: the kingdom of Sardinia reverted to the House of Savoy, to which were added all the provinces of the Genoese republic; the Lombardo-Venetian kingdom fell to Austria; the principalities of Modena, Reggio, and Mirandola, to which was soon annexed Massa and Carrara, were restored to the family of Este; Lucca was created a duchy, for the rightful Duke of Parina, whose hereditary state was conferred on Maria Lonisa, ex-empress of the French; the duchy of Tuscany was restored to the Austro-Lorraine dynasty; the Papal States to the pope; the kingdom of Naples to the Bourbons; while the petty state of San Marino was allowed to retain its republican form : and Monaco remained an independent principality under the Prince of Valentinois,

By the congress of Vienna, I. was again cast at the feet of the papacy and of Austria, and this at a period when progressive aspirations were strongly period when progressive aspirations were strongly re-awakened in the Italian people. The system of resolute oppression adopted by the reinstated rulers speedily produced an irreconcilable hostility between themselves and their subjects, and a network of secret societies for the organisation of national resistance spread throughout the entire land. The first-fruits of their organisation were the risings of 1820 and 1821 in Piedmont and Naples, to demand constitutional rights. Austrian intervention quelled both these movements; and in 1831, when a similar rising occurred in Modena and the Roman States, it was subdued with sanguinary ferocity by an Austrian army. In these movements, no distinct tendency towards national unity is perceptible; and only on the accession of Charles Albert to the throne of Piedmont (1831) was this grand idea of modern I, propounded by Joseph Mazzini, in an address to the king, urging him to assume the rôle of liberator and leader of Italy. The king of Piedmont, by yielding in some degree to the spirit of his time, prepared for l'iedmout the pre-emmence sho now enjoys throughout the country. The accession of Pius IX., in 1846, seemed the inauguration of a new era for I.: a general amnesty was followed by wise, liberal measures, which were also adopted by Tuscany and Piedmont, in emulation of Rome. Naples and the other states resolutely refused every measure of reform, and by a simultaneous outbreak in Sicily and Milan in January, the great revolution of 1848 was insugurated in Italy. The revolution of France in February imparted a strong impulse to that of I., and speedily Naples, Piedmont, and Rome conceded constitutional rights to the popular demands. The Milanese unanimously revolted against Austrian rule on the 17th of March, and after five days of broice lighting, the Austrians were expelled from the city, and Radetsky, with 70,000 troops, compelled to retreat from its walls. On the 29th, Charles Albert entered Lombardy, the avowed champion of Italian independence, and the leader of the national struggle. All the sovereigns of L contributed their best troops for the war, and on the Roman volunteers setting out for Lombardy, the pope himself in public pronounced a solemn benediction on their in public pronounced as often benediction on their

But ere a month had clapsed, Pius IX. suddenly halted in his career of liberator of Italy, and abandoning the national cause, launched (19th April) a severe censure against 'this unjust and hurtful war,' which, chiefly by his own benediction, had been consecrated in the eyes of at least the more ignorant of the people. The recall of the Neapolitan troops was the first-fruits of the encycleal letter, which may be considered the toesin of the subsequent fieror exaction through all Italy. For a time, however, the revolution made way; at the close of the year Rome became agaitsted; the pope fied to Gaets; and on the 8th of February, the Roman Republic was proclaimed, under the presidency of Mazzini. On the same day the Grand Duke of Iustical Control of the pope in Scale and the subsequence of the pope field had been allowed to the subsequence of the pope in Scale and the subsequence of the pope in ISO, are the concluding acts of this great revolution.

The reaction was complete and merciless in every state save Piedmont, the king of which kept faith with his subjects, and observed the constitutional forms conceded in 1848. Austrian troops exercised a crushing tyranny, and from time to time Europe shuddered at the recital of the dark cruelties practised in the dungeons of Naples and Rome. In the Congress of Paris, at the close of the Russian war (1856), Cavour (q. v.) forcibly exposed the un-avoidable dangers of a continuance of Austrian and papal misrule. He strongly urged the expediency of a withdrawal of French and Austrian troops from Rome and the legations. In the beginning of 1859, Victor Emmanuel proclaimed from the Sardinian parliament his intention of actively adding in the deliverance of the oppressed Itahan population from the yoke of Austria. Towards the close of the year, Sardinia and France jointly prepared for war with Austria, and in April 1859 the war commenced. The victories of Magenta and Solferino were quickly followed by the abrupt and inconclusive peace of Villafranca, 11th July 1859, by which a confederation of the Italian states with the papal protectorate was proposed as the best solution of L's difficulties. The whole of I. energetically rejected the scheme; and early in 1860, the various states whose sove-reigns were in flight from the Lombard campaign voluntarily declared in favour of annexation to the voluntarily declared in ravour of annexation to the kingdom of Piedmont. On the 18th of March, Parma, Modena, and the Emilian provinces were neorporated with Sardinia; and the grand ducky of Tuscany on the 22d. On the 17th March, the law by which Victor Emmanuel assumed the title naw by which victor Eminander assumed the citate of King of Italy was promulgated amidst universal rejoicings. On the 24th March, the provinces of Nice and Savoy were ceded to France. On the 6th of the ensuing May, Garibaldi, with about a thousand volunteers, set sail from Genoa for Sicily, where a revolutionary outbreak had taken place. His swift and comparatively bloodless conquest of the Two Sicilies is one of the most extraordinary incidents in modern history. Meanwhile, the Sar-diman generals Cialdini and Farini having advanced into the papal provinces, the papal forces under

Lamoricière were routed at Castelfidardo, which Lamorteiere were routed at Castelluardo, which was followed by the capture of 4000 prisoners at Loretto, and the surrender of Lamorteiere at Ancona. Thence the Sardinian forces marched into the Abruzzi, while Victor Emmanuel proceeded in person to Naples. On November 7th, at Teano, Garibaldi unconditionally relinquished to his sovereign the southern provinces liberated by his genius and valour. Umbria and the march of Ancona were next incorporated with the kingdom of I. The kingdom of I. was soon formally recognised by all the great European powers, with the exception of Austria. On the death of Cavour, June 1861, the ministry of Baron Ricasoli was formed, but after a brief term of office was succeeded by that of Ratazzi, 31st March (1862), whose avowed subserviency to the French empire created considerable alarm amongst the liberals of Italy. One of its earliest acts was the incorporation of the southern volunteer forces with the regular army. On the 9th and 10th, a great aggregate meeting of deputies from all the liberal clubs of the kingdom was held under Garibaldi's presidency; and on the 20th, having pre-viously been entertained at a grand banquet by the royal princes, he set out on his almost triumphal tour throughout I. with the view of organising rifleclubs amidst the youth of all the chief cities. An apprehension on the part of the government that Garibaldi contemplated an armed expedition in aid of Venice, led to stringent and unlooked-for measures of repression. Ministerial orders were next transmitted to Garibaldi, prohibiting any further organisation of the rifle societies. On the 20th of June, Garibaldi arrived in Turin, and on the 28th landed at Palermo, in Sicily, where he met with a warm reception from Prince Humbert, the heir-apparent of the Italian crown. On the 4th of July, the ministry was seriously disturbed by the warmth with which Garibaldi denounced the French occu-Palermo was held in his presence. Volunteers speedily hastened to join him, with the avowed intention of proceeding to Rome, despite the royal proclamation, which accused them of rebellion against their sovereign. A special message, accomagainst their sovereigh. A special message, accompanied by the royal proclamation, was forwarded by the king to Garihaldi, who, under the impression that he possessed the covert approbation of the sovereign, declined to desist in his expedition to Rome, but expressed his unshaken sentiments of loyalty to the king. On the 22d August, Sicily was declared in a state of siege, the liberal clubs were dissolved, and an armed force despatched to pursue and disperse the voluuteers. Garibaldi reached on the 18th Catania, and some days later succeeded in effecting a landing on the coast of Calabria with the greater part of his followers. General Cialdini having been appointed commissioner extraordinary in the island of Sicily, with full powers over the civil and military authorities, proceeded to the most stringent measures to effect the capture of Garibaldi. 'affair of Aspromonte,' in which Garibaldi's small force of volunteers were compelled to surrender, their heroic leader ordering them not to fire on the royal troops, put an end to the semblance of revolution. The wounded chief was conveyed as a revolution. The wonneed chief was conveyed as a prisoner to the fortress of Varignano, at Spezzia. The amnesty granted to him and his followers by the Italian monarch enabled him to proceed to Pisa, from whence he soon afterwards returned to his island-home of Caprera,

On the meeting of Parliament, Ratazzi was defeated, and resigned his portfolio on the 10th of Deo, and was succeeded by Signor Farini (q.v.). At the close of the German-Italian war, for which see GERMANY in the SUPPLEMENT, Penetia became a part of the K. of Italy by treaty with Austria, Oct. 3, 1866. In Oct., 1870, the Papal territories yet manproporiated were annexed by occupation and the vote of the people. Italian Language and Literature.—The Italian lauguage is descended from the Latin, and there have been various opinions as to the way in which the transition took place. In the view, how-ever, of the scientific students of language, there is nothing special in the case; the changes are sufficiently accounted for by that tendency to phonetic decay or corruption which is always at work in a living tongue, and which is especially active in a chaotic and transition state of society like that of I. at the downfall of the Roman empire. The already corrupt dialects of the uncducated become predominant, and being released from the fixing influence of a written literature, depart more and more from the grammatical standard; and in the case of L, the barbarian intruders would, to a still greater degree, mutilate the Latin, and introduce multitudes of words from the northern tongues. For some centuries, this corrupting process went on, in the course of which the Latin gradually divested itself of its original classical peculiarities. and degenerated into the impure or vulgar form known as the Romana rustica, or lingua Romanza, which became the prevailing language of the various races of South-western Europe, and received from each some of the most salient characteristics of their own native dialects.

This 'rustic Latin' may be termed the direct off-spring of Latin, and the parent of Italian: in the compositions of the Provencal poets, we find one form of it elevated to the rank of a polished, or illustre, written language as early as the 10th c., while the form which prevailed in Italy continued as late as the 12th c., an uncouth and vulgar dialect, contemptuously excluded from all learned composition. In the Sicilian court of the Hohenstauffen emperor, Frederick II., the Italian dialect was first rescued from this state of degradation; adopted by this monarch as the choice language of his court, it became the medium of his own and his son's literary and poetic creations, while his learned friend and secretary, Pier delle Vigne, may be termed the earliest Italian poet; his odes and canzones, composed a hundred years before Dante, are written in wonderfully pure Italian. The university of Naples, and several of the Sicilian schools, were founded by Frederick, whose cultivated and enlightened court became the centre of the letters and learning of Italy, and the abode of the best intellects of the time. Here, Italian reached a considerable degree of refinement and correctness, and received the name of the Aulic (court) or of the Sicilian

Toets have in all ages been the elevators and quardians of language; and we find Italian in the 12th and 13th centuries honourally employed by the poets of the age, especially by those of Tuscany, whose own oral dialect soon book precedence over all the others in polished expression and grammatical accuracy. The chief Italian poets of this age are Guido Guincelli, Guido Chisiberi, Fabrizio and Onesto of Bologna, Guido Lapo of Mantua; and the Tuscan poets Guitone d'Arezzo, Ronagiunta da Lucca, and Brunetto Latini Fiorentino, the illustrious preceptor of Daute. Fra Guittone, a member of the order of the Cavalieri Gaudenti, has left several compositions of merit, including souncts and oles, but his most interesting literary legacy consists of forty letters in prose, which are regarded as a

valuable specimen of early Italian, being the most ancient epistolary composition in the language. The writings of these early poets possess more linguistic than poetic interest, and are to be found in various collections, chiefly in the Rime Antiche (1518), the Poeti Antichi by Alacci (1661), and the modern work of Rannucci, Manuele della Letteratura del Primo Secolo (Florence, 1837, 3 vols.). Brunetto Latini (1260), the preceptor of Dante, was reputed 'a man of great sense and science.' His work, Il Tesoro, is a marvel of heterogeneous knowledge, Tesoretto is a curious compendium of moral precepts, and Il Pataffio a still more curious production, the obscene levity of which earned for him a place in the Inferno of his pupil. Guido Cavalcanti, the cherished friend of Dante, was more of a philosopher than a poet. Italian also began to be now adopted as the vehicle of learned and scientific prose. The historical chronicles of Matteo Spinola, a Neapolitan, are the oldest specimen of Italian prose literature (1247-1268); but the Florentine Malespini (died about 1280) is the first historical writer whose style is elevated and polished. In short, contemstyle is envated and poisson. In short, contemporary with the appearance of Dante (q. v.), the Italian dialect was rapidly superseding Latin in grave prose composition, as well as in poetry, and soon became the recognised oral and written polite language of the entire country, while various local dialects were preserved in use amongst the illiterate classes of the people. It has been finely observed that Dante found the Italian language in its cradle, and exalted it to a throne; the Divina Commedia imprinted on the Italian tongue a grave and majestic character, which at once qualified it to rank with the languages of Greece and Rome. The impetus imparted by Dante to the language and intellectual life of his country, has continued to the present day.

The minor poets, Francesco Stabile, or Cecco d'Ascoli, burned by the church (1327), and author of L'Acerba, a critical attack upon Dante, and a wonderful mixture of learning, acuteness, and superstition; Francesco da Barberino (1264-1348); and Cino da Pistoja, the learned jurist and poet, whose work on jurisprudence, Il Comento sul Codice, and pleasing amatory verses, won for him the commendations both of Dante and Petrarch (1270 -1336), claim mention before the great name of Francesco Petrarca (q. v.) (1304-1374), the creator of Italian lyrical poetry, and the enricher and perfecter of its language. The lustre of Petrarch's perfecter of its language. The lustre of Petrarch's fame, however, is not derived from his sonnets alone. Apart from their exquisite beauty and pathos, their classical elegance and simplicity of diction render them an abiding standard of Italian poetry. Italian, which, in its poetical capacities, we have seen created by Dante, polished and refined by Petrarch, was first moulded into a perfect form of prose by the prince of novelists, Boccaccio (q. v.). The Decamerone is a series of tales, and Boccaccio's best known work. Boccaccio's style is deeply tinged by his culture of classical litera-ture; and in his straining after the pompous majesty of Latin construction, he frequently exceeds the structural capabilities of his own language, which is naturally direct and simple in the order of its composition. Franco Sacchetti (1335-1400) of Florence, and Ser Giovanni Fiorentino (1348), also composed tales distinguished by the excellence of the language; while Dino Compagni and Giovanni Villani enriched the historical literature of I. with excellent chronicles, written in a spirit of fairness, and with great beauty of style.

The 14th c. was lavishly productive of great original literary creations, the writers of that age, or I Trecentisti, according to their Tuscan appellation,

being as distinguished for the sublime originality of their genius as those of the 15th c. were famed for their abstruse erudition and philosophy. Italian was the chosen language of the Trecentisti. and in their writings attained a high degree of refinement and purity. On the other hand, the scholastic writers of the 15th c. almost entirely excluded Italian from their works, substituting for the language of Dante and Petrarch a faulty form of Greek or Latin. To this circumstance may probably be attributed the languid development of literature during a period in which the most magnificent protection was afforded both by the pontifical and sovereign courts of Italy to the literature and art of the century, and when the discovery of printing imparted an impulse to the intellectual vitality of Christendom. Foremost among the encouragers of literature and art were the Medici at Florence; the Visconti, and, later, the Sforzas, at Milan; the houses of Gonzaga and Este at Mantua and Ferrara; the house of Aragon at Naples; and the Pontiff at Rome. Marsilio Ficino, Pico della Mirandola, Leon Battista Alberti, are some of the most distinguished writers who discarded their mother tongue and adopted Latin; while a host mother tongue and adopted leading wine a nest of grammarians, historians, philologists, and the logians openly pronounced the *illustrious* Italian language a vulgar dialect, unfit for philosophical or learned composition. But this debasement of literary taste was happily of brief duration, and to Lorenzo dei Medici, entitled the 'Father of Letters, is owing the literary revival of the Italian tongue. Under this princely patron of letters, arts, and sciences, public libraries were founded or replenished, learned societies inaugurated, rich antiquarian treasures collected, universities opened, and a true standard of literary truth and beauty once more set up. His friend and protégé, Angelo Poliziano, wrote elegantly hoth in Italian and Latin, and composed the first regular dramatic work in the former language, under the title of L'Orfeo. Towards the close of the 15th c. and the opening of the 16th, a taste for the romantic and heroic in poetry began to shewitself. This taste was cultivated by Durante da Gualdo, by Luigi Pulci (q. v.) in his Morgante Maggiore, and by the still more famous Mattee Boiardo (q.v.), whose Orlando Innamorato evidently suggested the greatest of all the works of this kind, the Orlando Furioso of Ariosto. But by far the most important historical works of the time were written in Latin—for example, those of Silvio Piccolomini, Marc Antonio Sabellicus (died 1506), Bernardo Giustimanus (died 1489), and Georgius Stella (died 1480). During the century of scholastic Steins (uned 1400). During the century as schotastic crudition, the spring of Italian eloquence flowed with sluggish course until the impassioned and unstudied oratory of Jerome Savonarola (burned 1498) revived the traditions of ancient Rome, and reminded his hearers that Cicero too was an Italian.

The 15th c., though not marked by much creative genius in literature, unquestionably exercised an immense influence on the Italian mind. The revival of letters, the invention of printing, the discovery of a new world, and the opening up of a maritime channel to the wealth and traffic of the Indies, co-operated, one may say, in producing that won-derful development of art and enterprise which the succeeding age exhibited; while the advancement of learning and science was promoted and systematised by the founding of numerous universities and literary institutions, the aim of these latter being the due to the artistic taste of Aldo Manuzio. ALDINE EDITIONS.

The 16th c. is confessedly the Augustan age of Italian letters, art, and science. In a galaxy of selections are those of Ariosto (q. v.), Tasco(q. v.), Macchiavelli (q. v.), Guicciardini (q. v.), Raphael (q. v.), Michael Angelo (q. v.), Macchael Angelo (q. v.), Macchael Angelo (q. v.), Palladio, and Vignola. successors vied with the other sovereigns of Italy in their munificent patronage of those men of genius, who, under the title of Cinquecentisti, are considered models of pure and noble Italian composition. The Orlando Furioso of Ariosto, held to be the first genuine epic of chivalry and romance, celebrates the deeds of the legendary ancestors of the house of Este. It exercised immense influence, even amongst the most illiterate classes, by whom its choicest beauties were committed to memory, in order to be sung as the solace of labour in the field or city. The next great work of the century was La Gcrusalemme Liberata, by Torquato Tasso (q. v.), whose father was also an excellent poet and scholar. Tasso's prose writings and epistles are noble in style, and grave and philosophical in matter (1544–1595). Their best imitators are L'Alamanni, Il Giron Cortese and L'Avarchide; Rucellai; and Erasmo da Valvasone, in his La Caccia and L'Angeleida (or The Wars of the Angels), from which Milton or the wars of the Angels, from which Million probably borrowed some valuable him (1593). Giangiorgio Trissino wrote the first notable Italian drama, Sygonisba. Besides this, the Tullia of Ludovico Martelli, the Canae of Sperone Speroni (1500—1588), the Torrismondo of Tasco, and the (1500—1588), the Torrismondo of Tasso, and the Edipo of Andrea dell' Anguillara, deserve mention— —the last is considered the best Italian tragedy of the time. The comedies of Bentivoglio, Salviati, Cecchi, Firenzuola, and others, are stamped with that prevailing spirit of licentiousness which disfigures many of the finest productions of the age. The popular dramatic pieces, or Commedie dell' Arte, enjoyed as high repute among the lower classes as the higher drama did in courtly and patrician circles. Some of the chief composers of these panto-mimic comedies are Flaminio Scala, Angelo Beolco, Andrea Colmo. The writers of pastoral dramas Andrea Collino. The writers of passersa training intundate this epoch, but none can comprete with Guarini (q. v.) in his sweet idyllic work, II Pastor Pido. Poetry was first combined, during this century, with music—one of the earliest operatic compositions being the Darfee of Rimencini (died 1621). The sonnets of Michael Angelo exed in a certain dignity and originality of thought. Vittoria Colonna, celebrated in the verse of Ariosto, was the most illustrious poetess of her time; which produced numerous other female writers, whose works have been collected and published by Domenichi.

have even confected and putomated by Domehran.

Foremost among the prose-writers stands Macchiavelli; his Arte della Guerra (Art of War), Istorie
Florentine (History of Florence), and political
treatise, Il Principe (The Prince), all excel in their
various styles. Giovanni Botero, Giannotti, and
Paruta, are also political writers of high merit. Greater than either is Francesco Guicciardini, whose History of Italy has only one blemish, viz., want of brevity. The works of Bembo (q. v.), historian and poet, exhibit the Italian language subjected to a regular grammatical system. Literature was historically treated by Barbieri and Doni; art, by Vasari, Campi, and Lomazzi; and architecture, by Vignola and Palladio.

The progress of the age is equally perceptible in

philosophy, which, bursting the fetters of scholastic diffusion of general kowledge and sound practical formalism, displays the unuser freedom of special science. Many of the magnificent typographical lation in the works of Cardan (q.v.), Bruo trassures with which the great public libraries of (q.v.), and Vanini. Many celebrated institutions Italy abound, belong to this golden age, and are or scademics for the discussion and diffusion of 68. knowledge date from the 16th c., one of the most noted being the academy Della Crusca, founded at Florence for the preservation and perfecting of

The 17th e., if less prolific in great literary names than its predecessor, is nevertheless the golden age of Italian science; it produced a host of illustrious discoverers in philosophy, mathematics, and physic. Such was the fame of Italian science at this period that the universities of Florence, Naples, Pisa, and Venice were thronged with foreign students. Learned societies for the cultivation and practical demonstration of the physical sciences were opened throughout Italy (see ACADEMY). Libraries were collected and enriched, to afford every facility to learned research. The most celebrated savants are the world-famous Gableo (q. v.), Torricelli (q. v.), Borelli, the astronomer Cassini (q. v.), and Viviani, the pupil and biographer of Galileo; Malpighi and Bellini, anatomists and physicians. Contemporary with these, we find Gian Vincenzo Gravina, whose lectures on civil law attracted audiences from all Europe. In historical composition, the best known works are Sarpi's famous History of the Council of Trent; its equally famous refutation by Pallavieino; The History of the Wars of the Netherlands, by Bentivoglio; and of The Civil Wars of France, by Davila (q. v.), A few of the great names of literature are-Bianchi, an acute thinker on political and social science; Monte-Cucculi, author of the Aphorisms of the Art of War, written with Spartan brevity of style : Bartoli, the Jesuit historian ; and

Segneri, the Jesuit orator. The poets of the 17th c., at least Marini (q. v.) and his school, display a degenerate taste. Fonduess for characteristics; but several of his contemporaries
--Chiabrera, Guidi, Tassoni, author of the admirable mock-heroic poem, La Secchia Rapita (The Stolen Pail), Filicaja (q. v.), and others, have written with a grave energy of style and a warmth of sentiment elevating to any age. The theatrical and operatic representations at the various sovereign courts were of exceeding splendour, as if in compensation for the paucity of dramatic compositions

In the 18th e., a vigorous revival of poetry and letters took place. Giannone, in history; Capasso, in literature; Cirillo, in physic; Mazzochi, in archæology; Il Genovesi, in political economy; the brothers Galiani, in their respective sciences of architecture, political economy, and philology; Filangieri (q. v.) and Beccaria (q. v.) in the phil-Phangeri (J. V.) and Peccha (J. T.) in the pinch obsolute of jurisprudence; Mario Pagano, in the science of civil law; Poli (1746—1825), Volta (1745—1826), Galvani (1737—1798), Scarpa (1748—1832), and Spallanzani (1729—1799), in physical science; Maffei and Calsabigi, in poetry, are some of the names by which this period was enabled. The 18th c. can also boast of the greatest names in Italian dramatic literature, Metastasio (q. v.) (1698 -1782), who is considered the master of the pastoral drama: flowing, sweet, and silvery, the language of his gentle muse presents a strange contrast to the brevity, sternness, and classical plainness of Italy's greatest tragedian, Vittorio Alberi (a. v.) (1749 1803), by whom a thorough revolution was effected in the drama of his country. A no less nearked reformer of comedy is his contemporary, Carlo Goldoni (q. v.) (1707—1793). During the present (19th) century, the genius of

Italy has revived anew in science and literature. By the best writers of the day, a sound Italian style, untainted either by Gallicisms, or by the false

reform: the resolute combatant of the school of Marini, his fine works are rigidly moulded on tha pure Trecentisti style: and in his great poem, Baseilcana, the language is impregnated with a Dantesque grandeur, which has caused it to be said that the spirit of Dante has inspired the works of Monti. His translation of the Iliad and that of the Odyssey by Pindemonte, are the best classical translations in Italian. In the wayward and fervid genius of Ugo Foscolo (q. v.), we find the reflection of the vicissitudes and political chaos of his times; his lyrical work, I Sepoleri, is written with extreme polish and faultless taste, which may also be said of the lyries of Leopardi. Botta, Ricci, Bagnoli, Arici Sestini, Pananti, and Lorenzi, deserve mention among the modern poets. Grossi is a spirited poet, who has written chiefly in the Milanese dialect. In the poismant and imbittered verses of Berchet, wa recognise the double inspiration of his country's and his own political sufferings; and the gentler poet, Silvio Pellico, was already famous for his poetic tragedy, Francesca da Rimini, previous to his incarceration in an Austrian dungeon

Rossetti, the exile and poet, and the most distinguished commentator on Dante's Divina Commedia; Giov. Battista Niccolini, whose drama, Arnoldo da Brescia, is one of the finest works of modern Italian genius; Leopardi, poet, philologist, and philosopher; Giusti (q. v.), the first Italian satirical lyrist of the 19th c.; Mameli, the patriot poet, who fell in 1848 at Rome; Prati, Aleardi, Dall' Ongaro, Carcano, and Montanelli, are some of the most conspicuous worshippers of the Italian muse in the 19th Among the most successful novelists are Manzoni, whose Promessi Sposi has created a new Manzoni, whose Promessa Sposi has Greated a new school of fiction; Rosini (Monaca di Monza, Luisa Strozzi, Il Conte Ugolino), Cantà (Margherita di Pusterla), Grossi (Marco Visconti), and D'Azeglio, whose patriotic novels have exercised a wide influence on the youth of the country. Ettere Fieramosca and Nicolo dei Lapi' are models of classical romances, Guerrazzi has written novels full of the noblest poetry. Bersezio and Ruffini are also worthy of And among authoresses, we may mention Teresa Bandinella, Ceciha de Luna Folliero, Giustina Michiel, Isabella Albrizzi (whose biography of Canova is a graceful and accurate delineation), and Signora Ferrucci, whose educational works possess high merit. The modern historians of Italy are very numerous. Balbo's Summary of Italian History, Butta's History of Italy, Coletta's Nuples, Amari's Sicilian l'espers, Cantu's colossal work on Universal History, Zeni's Compendium of Italy's History, and Scopoli's History of Italian Legislation, are among the best works; while interesting historical monographs of various periods or states have been published by Cauetti, Canale, Brofferio, Anelli, Cattaneo, the graphic recorder of the rising at Milan in 1848, and the learned compiler of the Archivio Triennale, or series of documents bearing Archivo Privata, of section of definition of 1848 to 1850.
Political economy and philosophy have found in Mazzini, Gioja, and Romagnosi able exponents.
The political writings of Joseph Mazzini (q. v.), apart from their political tendencies, have exercised immense influence on the youth of Italy by their high moral tone and beauty of language. The various schools of philosophy have found adherents and expounders in Borelli, Galuppi (1770—1846), Mami-ani, Rosmini, Gioberti, and Tommasco, mostly all exponents of ecclesiastical philosophy; while Testa, Franchi, Mastriani, and Cattaneo are the exponents of speculative and independent philosophy. Antiglitter of the Scientisti school, has been adopted, quarian and archaeological science has been ably One of the best modern poets of the classical school, illustrated by Inghirami, Fannucci, Manno, Litta, Vincenzo Monti, has materially assisted this literary Viscont, and Sestini. Bossi, Fumigalli, Ferrat, Viscont, and Sestini. Bossi, Funidalli, Ferrat, Viscont, and Sestini. Bossi, Funidalli, Ferrat, Viscont, and Sestini.

and Rosini have written the best dissertations on art. Biography, which as yet has been somewhat neglected by Italian writers, has found in Professor Villari a successful cultivator; his Life of Savona-Villari a successful cultivator; his Life of Saxona-rola is written with liberality, grace, and cloquence. The most complete histories of Italian litera-ture are Crescimbent, Stories della Folgar Poesia, 6 vols. (Rome, 1698; Venice, 1731); Quadrio, Storia e Regione d'opsi Poesia, 7 vols. (Bologna, 1739); Turaboschi, Storia della Letteratura Indiana, 14 vols. (Modena, 1772—1783; 16 vols. 1787—1794; 12 vols. Komen, 1785; 16 vols. Malan, 1822—1826); Corniani, Secoli della Letteratura Indiano, 9 vols. (Brescia, 1818—1819); Maffei, Storia della Lettera-tura Italiana, 2d ed., 4 vols. (Milan, 1834); Cimorelli (Milan, 1845); Giudici (Florence, 1847); Levati (1831).

ITA'SCA, LAKE. See MISSISSIPPI.

ITCH (known also as SCABIES and PSORA) is a contagious vesicular disease of the skin. All parts of the body, unless perhaps the head, are liable to be affected, but the most common seats of the disease are the wrists and hands, and especially between the fingers. The first sign of this affection is an itching sensation, which, upon minute examination, is found to proceed from a minute conical vesicle, while the adjacent portions of epidermis present a more scaly appearance than is natural. This condition of the skin is due to is natural. This condition of the skin is due to the presence of a minute acarus, the Ircit-MTE (q. v.), which burrows within the epidermis, and excites the cutaneous irritation. The affected parts itch with increased intensity when the patient is warm in bed, or after the use of stimulating drinks or exciting condiments; and as he cannot refrain from scratching himself, the vesicles get more or less broken, and become interspersed with numerous little bloody points.

The itch being popularly regarded as a somewhat disreputable affection, and being highly contagious, it is very important that it should be distinguished from other cutaneous disorders. Eczema, prurigo, and lichen, are the affections most likely to be confounded with it; but eczema, though a vesicular disease, presents rounded and not conical vesicles, and at most only a pricking sensation, and nothing like the irritation of itch; while prurigo and lichen are papular disorders, and are not accompanied by the presence of vesicles; moreover, none of these

diseases are contagious.

The itch is always communicated by contact, either immediately, as by the act of shaking hands, or through the medium of articles of clothing or bedding which have been used by a person suffering from the disorder. In some cases, the proximate cause of the disease, the itch-insect, is conveyed to the sound person in its perfect form; while in other cases, the ova or embryos suspended in the fluid of

the vesicles may be the mode of transmission.

The disease, if not cured, will go on for an indefinite period, probably for life; but in cold and temperate climates, never gives rise to serious injury to the health. Numerous external remedies have at different times been employed for the cure of this disease, but the great remedy is sulphur, which may be regarded as a specific. In the case of an adult, Mr Erasmus Wilson, our highest English authority on skin-diseases, recommends that 'four ounces of sulphur ointment should be well rubbed into the entire skin before the fire, and particularly into the affected portions, morning and evening, for two days. It is desirable also that the patient should wear a flannel shirt, and retain the same during the whole of the treatment. On the morning of the third day, the patient should take a warm bath, and wash the skin thoroughly with plenty of soap, when the cure will generally be found to be effected.'

When patients strongly object to the smell of sulphur, which is not unfrequently the case, an ointment made by digesting over a vapour-bath, for 24 hours, three parts of stavesacre in powder, with five parts of lard, and then straining, may be used. According to M. Bourguignon (who has made numerous experiments on the deleterious action of medicines on the living itch-mite), this ointment will cure the disease in four days.

ITCH-MITE (Acarus scabiei or Sarcoptes scabiei) is supposed by some naturalists to have been referred to by Aristotle in the 5th book of his Historia Animalium, cap. 31. But although the itch was undoubtedly known both to the Greeks and Romans, there is no certain evidence that a mite was recognised as the cause of the disease earlier than by Avenzoar, an Arabian physician earlier than by Avenzoar, an Araban physician of the 12th century. Throughout the whole of the middle ages, and till the present century, the necessary connection between the disease and the mite was universally recognised, as is obvious from the writings of Scaliger (1557) and others; and a paper read by Adams before the Royal Society in 1805, contains two very good figures of the mite. During the first ten years of this century, many practitioners, not succeeding in finding the animal, expressed doubts concerning its existence, and in expressed doubts concerning its existence, and in 1812 there occurred a remarkable incident in the history of this mite. M. Gales, the chief apothecary to the Hospital of St Louis, tempted by a prize offered by one of the unbelievers, published in that year a treatise on the itch, in which he declared that he had seen more than 300 of the mites, and in which he gave a drawing of the auimal, which, although it differed materially from the delineations of earlier observers, was at once accepted as an exact representation of the true parasite, and was copied for several years into all works treating the itch, until Raspail discovered that M. Gales's Memoir was a tissue of deceptions, and that the animal which he had figured was the cheese-mite! The existence of the itch-mite was now more distrusted than ever. until, in 1834, Renucci, a Corsican student, demonstrated the presence of the creature. Many points regarding the structure and habits of this curious animal have been since revealed by the investigations of Gras, Raspail, Hebra, Gudden, and especially De la Foad and Bourguignon, who have presented to the French Institute A Practical Treatise on the Entomology and Comparative Pathology of the 1tch as it occurs in Man and the Domestic Animals, which has been published in the last volume (1862) of the Memoires présentés par divers Savants à l'Académie des Sciences.

The adult female mite is considerably larger than the male ; it is visible to the naked eve, and forms a roundish grayish-white corpuscle, not unlike a starch granule; it is about 1th of a line in length, and 1th in breadth. When seen under the microscope, it presents a truncated tortoise-like shape, and is seen to be studded with hairs and bristles. The head terminates in two pairs of mandibles, and as these mandbles afford good characteristic distinctions of the species, representations are given in fig. 2 of tho mandible in the female itch-mite and in fig. 3 of the mandible in the sugar-mite.

In order to penetrate the horny layer of the epidermis, the mite assumes, according to Gudden, a nearly perpendicular position; and to avoid as much trouble as possible, it usually selects such spots as give least resistance, such as the space between the fingers, the inside of the wrist, &c. Once fairly buried, it does not again come out, but burrows, and forms tortuous galleries within the skin. These the most important are the Itineraria Antonini and galleries resemble the mark which is formed when a the Itinerarium Itieraodynitianum. The Itinerarius pen is drawn lightly over the skin without causing Indonini are two in number, the Itinerarium precin-

a scratch. In young children, and in persons with a debeate skin, they appear of a grayish-white colour; while in persons with a coarse dirty skin they are of a blackish tint. At certain intervals, the galleries are pierced by small openings, for the admission of air; it is through these openings, which sometimes appear like very minute black dots, that the young eccape. The vesieles characteristic of the tith-discase are attributed to a poison ejected by the mite. The males are smaller und much scarcer than the

There are numerous species of itch-mite (Sar-copies) which infest the lower animals. One of them (S. canis) produces Manye (q. v.) in dogs; another (S. equi.), a comparatively large species, sometimes occurs in horses; another (S. bois) in oxen in some parts of Europe; another (S. oxis) in sheep. Some of these are occasionally transferred to human beings, and cause irritation and annoyance, which, however, sevens to be limited to the life of the individual mitte transferred, the situation not being congocial enough for their increase.

For further information on the structure and habits of this animal, the reader is referred to the second volume of Küchenmeister's work on Parasites (translated for the Sydenham Society), and to

I'THACA, a village in the state of New York, America, at the southern extremity of Cayung Lake, 162 miles west-by-south from Albany. It has a large trade in coal, and 30 mills and manufactories. Pop. (1860) 6813.

ITTNERARY (Lat. itinerarium, derived from iter, a journey), the name given by the Romans to a table of the stages between two places of importance, with the distances from one to another. The itineraries of the ancients contribute much to our acquaintance with ancient geography. Of these,

the most important are the Hineraria Antonini and the Hinerarium Hierosolyminum. The Hinerarium Antonini are two in number, the Hinerarium provinciarum and the Hinerarium morinum, the former containing the routes through the Homan provinces in Europe, Asia, and Africa; and the latter the principal routes of navigators, who then sailed only along the coasts. They take their name from the containing the routes of the Hinerarium Hinerarium as corrected up to his time, but the west published, as corrected up to his time, but the date.—The Hinerarium Hierosolymidanum was drawn up 33 A.D., for the use of piligrins from Burdiglas (Bordeaux) to Jerusalem. Of these timeraries, various editions have been published.

ITINERATING LIBRARIES are small collections of books for popular reading contained in boxes, one of which, after being stationed in a village for a certain length of time, is transferred to another village, when another takes its place; and so on with any assigned number of boxes, each with its special assortment. The principle of shifting about boxes of books in this way in rural districts is referred to in the memoirs of Oberlin (q. v.), and has been long known in Wales, as well as the Highlands; but it met with no significant approval. until it was improved upon and carried practically into effect on a broad scale by Samuel Brown, a merchant in Haddington (died 1839), who, taking a deep interest in popular instruction, set on foot itinerating libraries in several villages of East Lothian. The books were assorted to the extent of 50 volumes in a box. At first, there were four boxes : and as the time allowed for each was two years at a village, the inhabitants of four villages had the perusal of 200 volumes in the space of eight years, at one-fourth the expense of the whole. undertaking was begun and locally superintended from motives of benevolence, and the books were supplied gratuitously. The success attending this economic method of establishing libraries in a country district, led to its extension over a wider sphere, on the principle of readers paying a small sum per annum, also of forming the assortments of books from the used new works in a central subscription library. In 1862, there were 18 itinerating divisions in use in East Lothian, while there are several elsewhere in Scotland, as also in England, and 12 divisions were lately transmitted to Jamaica, where they are to be under the charge of missionaries. From all that can be gathered, the establishment of libraries of this simple class proves a valuable auxiliary to schools, churches, and other agencies of social improvement. For a variety of particulars on the subject, see a small volume, Some Account of Hinerating Libraries and their Founder (Edm. 1856).

l'TLEHOE, an ancient town, in the duchy of Indistein, and the oldest in the duchy, is situated on the Stör, in a valley backed by finely woosied hilis, about 30 miles by water north-west of Hamburg, Tolacce, chicory, sugar, and brandy, are manufactured, and important horse and cattle markets are held here. I, also carries on a considerable general trade by water with Altona and Hamburg, Pop. 6691.

The original castle around which I. gradually arose was built by Charlennagne in 809. I. was twice taken by Tilly in the Thirty Years' War, and in 1657 a great portion of it was burned down by the Swedes.

I'VAN, or I'WAN (the Russian form of John), the name of a number of Russian czars.— Ivan I. (1462—1505) nay be regarded as the founder of the Russian empire. He was at first only Grand Duke

of Moscow, but succeeded in shaking off entirely the yoke of the Tartars, and in subjecting a number of the Russian principalities to his own sway. In 1472, he married Zoë, a niece of the last Byzantine emperor, and thus brought the two-headed Byzantine eagle into the Russian arms, an emblem with which are connected pretensions not likely to be forgotten by the Russian emperors, although they may not be openly urged. This marriage opened up a way also for the entrance of European civilisation into Russia.—Ivan II. (1533—1584) did much for the advancement of his country in arts and commerce, as well as for its extension by arms. He concluded a commercial treaty with Queen Elizabeth, after the English had discovered the way to Archangel by sea. He bore, however, the surname of the Cruel, and merited it by his deeds, amongst which was the slaughter of 60,000 persons -other accounts make the number only 25,000—at Novogorod in six weeks, on account of a supposed plot to deliver up the city and surrounding territory to the king of Poland. —Ivan III., born 23d August 1740, was the son of —IVAN III., born 23d August 1740, was the son of the Duke Anthony Ulric of Brunswick-Wolfen-büttel, and the Russian Grand Duchess, Anna Carlowna. The Empress Anna Ivanowna adopted him as her son and heir, but she dying soon after, and Elizabeth, the daughter of Peter I., seizing the throne, he was imprisoned during the remainder of his life; and by the orders either of the Empress Catharine IL or of her counsellors, was put to death by the officers of the garrison at Schlüsselburg, where he was confined, on 5th December 1764. Those Russian Ivans are sometimes differently numbered, the reckoning being made to begin further back, with those who were only Grand Dukes of Moscow.

IVES, St., a municipal and parliamentary borough of England, in the county of Cornwall, beautifully situated on the north-east shore of the bay of the same name, with an outlook on the Bristol Channel, about 10 miles north-north-east of Penzance. It is a very old and picturesque town; its church, a granite building of the early part of the 15th c, stands on the beach, and is reached by the spray in rough weather. Its harbour admits vessels of 200 tons. I. is the head-quarters of the pilchard-fishery. In the vicinity are several important tin and copper mines. Pop. (1861) of parliamentary horough, which returns one member to parliament, 10,354.

IVES, St, a small market-town of England, in Huntingdonshire, is situated on the left bank of the Ouse, 6 miles east of Huntingdon. A very large weekly cattle and corn market is held here. Brewing and malting are the chief branches of industry. Pop. (1861) 3321.

IVI'ZA (anc. Ebusus), one of the Balearic Isles (q. v.), lies about 50 miles south-west of Majores. It is 23 miles long, and 12 miles broad; pop. 11,000. I'ziza, the chief town, has a pop. of 5100. Sult, the principal article of export, is extensively manufactured on the shore.

I'VORY was the name fermerly given to the main substance of the teeth of all animals, but it is now restricted to that modification of dentine or tooth-substance which in transverse sections shews lines of different colours running in circular arcs, and forming by their decussation minute lozengeshaped spaces. By this character, which is presented by every portion of any transverse section of an clephant's tusk, true ivory may be distinguished from every other kind of tooth-substance, and from &c., possess teeth, horns, or tusks, which, from their act, possess teeth, norms, or tusks, winch, from their large size and from their density, can be used for the same purposes in the arts as those for which true ivory is employed. The ivory of the tusks of the African elephant is held in the highest estimation by the manufacturer, on account of its greater density and whiteness. The tusks are of all sizes, from a few ounces in weight to more than 170 lbs. Holtzapffel states that he has seen fossil tusks from the banks of the rivers of Northern Siberia which weighed 186 lbs. each. There are various chemical processes by which it may be dyed of various colours, as black, blue, green, yellow, red, and violet.

Ivory articles can be made flexible and semitransparent by immersion in a solution of phosphoric acid of sp. gr. 1.130, till they become translucent. They are then to be taken out, washed with water, and dried with a soft cloth, when they are found to he as flexible as leather. They harden on exposure to dry air, but resume their pliancy when immersed in hot water.

Much important information on the subject of ivory generally will be found in Holtzapffel's

Mechanical Manipulation. The tusks of the elephant have from very early periods constituted an important article of trade, in consequence of their great beauty as a material for ornamental manufactures, and even works in fine art. I. is frequently mentioned in the Old Testa-ment. With the Greeks it became a most important material, and by the hands of the sculptor Phidias a statue was produced of the Olympian Jupiter, of such marvellous beauty and imposing majesty that it was considered a misfortune to die without having seen it. By the Romans, who were supplied from Africa, it was also extensively used, and by them its use was diffused over the whole of Europe. The art of working in ivory doubtless had its origin in India, where it has always been a much valued material, and formerly supplied indirectly much of the ivory sent to Europe. The value of ivory is in the ivery sent to Europe. The value of ivery is in proportion to the size and soundness of the teeth. Below the weight of five pounds, they are called scrivelloes, and are of the least value, rarely reaching five shillings per pound; but double that price has been given for teeth of unusually large size. The quantity imported into Great Britain from all parts rather exceeds 500 tons per annum, the value

The so-called ivory obtained from the hij po-potamus is in especial favour with dentists for making false teeth, on account of its pure white colour and freedom from grain. The fossil ivory, which is found in considerable quantity in Siberia and the arctic regions, is uncommonly hard and brittle; it is also whiter, and wants its waxy softness. At present, the demand for ivory is rapidly increasing, owing to the great taste and skill of some of the artists who work in this material, and as the supply increases but very slowly, it is likely to become very dear. The works in ivory exhibited in the International Exhibition (1862) shewed a very extraordinary advance in the beautiful art of ivory-carving, and single specimens were shewn of the value of £500.

of which is nearly £400,000.

IVORY, VEGETABLE. This curious material is furnished by one of the most beautiful of all the palm tribe. It grows on the Andean plains of Peru, and on the banks of the river Magdalena, and other parts of South America. The stem of this palm (the Phytelephas macrocarpa) is short and every counterfeit, whether derived from tooth or procumbent, but it has, proceeding from its crown, bone. Although no other teeth, except those of a magnificent taft of light-green pinanted leaves the elephant, present this characteristic, many other of extraordinary size and beauty; they are like animals, such as the walrus, narwhal, hippopotamus, immense ostrich-feathers rising from 30 to 40 feet in

height. The flowers are on a crowded spadix, and have neither calyx nor corolla. The fruit, which is as large as a man's head, consists of many 4-celled leathery drupes aggregated together, and contains numerous nuts of a somewhat triangular form, each nut being nearly as large as a hen's egg; they are called Corrozzo nuts in commerce. The kernels of these nuts when ripe are exceedingly hard and white, in fact they resemble ivory so completely that few names have ever been better applied than that of vegetable ivory. They have of late come into extensive use by turners in the manufacture of buttons, umbrella-handles, and small trinkets, and so closely resemble true ivory as frequently to deceive competent judges. Two or three millions of these nuts are now imported annually, and are chiefly used by the London and Birmingham

IVORY-BLACK. See BONE-BLACK.

IVRE'A, a town of Piedmont, and capital of a province of the same name, has a population of 9238, and is situated on the left bank of the Dora Baltea. partly on level ground and partly on an eminence exposed to the sirocco winds. The cathedral is supposed to have been a temple of Apollo, and contains an ancient sepulchral monument of the age of Augustus. The carnival of L is famed for its picturesque allegorical pageants.

IVRY-SUR-SEINE, a manufacturing town of France, in the department of Seine, is situated on the left bank of the river of that name, three miles above Paris. Glass, earthenware, and chemical products are the chief manufactures. Pop. 8679.

IVY (Hedera), a genus of plants of the natural order Araliacee, consisting of shrubs and trees, mostly natives of tropical countries. The flowers have five or ten petals, and five or ten converging or consolidated styles. The fruit is a berry with five or ten cells.—The Common Ivy (H. helix) is a well-known native of Britain, and of most parts of Europe, although it is more rare in the northern countries. Its long, erceping, branched stem, climbing on trees and walls to a great height, and closely adhering even to very substances by means of rootlets which it throws out in great abundance along its whole length, acquires in very aced plants almost the thickess of a small tree. Its 5-lobed, shining, stalked, evergreen leaves, clothing bare walls with green luxuriance, serve to throw off rain, whilst the rootlets of the stem suck out the moisture, so as prejudice, that ivy tends to produce dampness in substance which smells like turpentine.

walls. It injures trees however, both by abstracting their sap and by constriction. The flowering ing their sap and by constituent. The mortal periodic periodic of ivy have ovate, entire leaves, very different from the others. Its small greenish flowers are produced in the beginning of winter, and the small black berries are ripened in the following year. The berries are eagerly eaten by many birds, although they have a pungent taste, and

Ivy, shewing the Rootlets.

contain a peculiar bitter principle called hederine, and an acid called hederic acid; which are also found in a gummy exudation obtained by incisions from the stem, and occasionally used in medicine as a depilatory and a stimulant, and in varnish-making. An ointment made from the leaves is used in the Highlands of Scotland to cure burns. In Egypt, the ivy was sacred to Osiris, in Greece to Bacchus (Dionysos), whose thyrsus was represented as surrounded with ivy; the Romans mingled it in the

laurel crowns of their poets.

There are several varieties of ivy often planted for ornsmental purposes, of which that generally known in Britain as Irish Ivy, and on the continent as English Ivy, is particularly esteemed for its large leaves and luxuriant growth. It is said to be a native of the Canary Isles. Ivy grows readily from cuttings.—H. umbellifera, a native of Amboyna, is said to produce a finely aromatic wood; and H. to render damp walls dry, contrary to a common terebinthacea, a Ceylonese species, yields a resinous

has in Eng. the power of dzh; in Fr., of zh; and in Ger., of y. Both the sound and the character have sprung out of the original vowel i. When such a word as Iulius is pronounced rapidly, it naturally slides into Yulius. The Romans, though they had but one character for both, recognised this distinc-

tion between the vowel and the semi-vowel; and in the case of such words as cuius, maius, some writers doubled the i, and wrote one or both long, as cullus or cuilus. There is little doubt that the original Roman sound of this semi-vowel was that of Eng. y (youth), still given to it in German. But as this sound has a tendency to convert the consonant preceding it into a sibilant (see letter C), so it has a tendency to become itself sibilant, and Yul- slides into Fr. zhul-, Eng. dzhul-. This transi-tion had already taken place in the later ages of the Latin, at all events, in the popular pronunciation, as appears from such inscriptions as congiunta, for conjuncta; Zesu, for Jesu.

It was the Dutch scholars of the 16th and 17th centuries that first introduced a regular distinction between the consonantal and vowel powers of i, and

marked the former by the distinct character j (a long i, projecting below the line). The character has been adopted in the modern Teutonic and Romanic languages, with the exception of Italian, which represents the sound by gi or ggi, as Giovanni from Lat. Johannes; maggiore, from Lat. maior. In Span, it has a guttural power, and is interchangeable with x, as Xeres, or Jeres.

JA'BIRU (Mycteria), a genus of birds of the same

Australian Jabiru.

little curved upwards. The species are few, but are Christian name in the former country, was used as

THE tenth letter in our alphabet, widely distributed in South America, Africa, and Australia

JABUTICABA. See EUGENIA.

JA'CANA (Parra), a genus of birds of the order Gralle, commonly ranked in the family Rallide, natives of the warm parts of Asia and the Asiatic islands, Africa, and South America. In general appearance, they much resemble gallinutes and coots. The feet, though not webbed, are adapted, by the great length of the toes and claws, for walking on the surface of weed-covered lakes and swamps, the native haunts of these birds, where they never fail to attract the attention of the traveller. The COMMON J. (P. Jacana) is a South American

Common Jacana (Parra Jacana).

species, abundant in Guiana and Brazil. It is about species, authorities the definition of the back is about ten inches long; black, except the back and part of the wings, which are of a bright cheanut colour. The INDLA J. (P. Milaco) and the CHINESE J. (P. Simensia) are also among the best known species. Both are found in India and other parts of the East.

JACARA'NDA WOOD, a very hard, heavy, brown wood, also called *Rosewood*, from its faint agreeable smell of roses. It is brought from South agreeable smell of roses. It is brought from South America, and is produced by several trees of the genus Jacaranda, of the natural order Bigmoniaece. Several species of this genus are called Caroba in Brazil, and are there accounted anti-syphilitic.—
Several species of the nearly allied genus Tecona
also have an extremely hard wood, as T. pentaphylla,
a native of the Caribbean Islands. The Brazilian Indians make their bows of the wood of T, toxiphora, or Pao d'arco.

JACK. 'The Jewish Jacobus was corrupted through Jacquemes to Jaques in France, and James family with storks and adjutants; the chief dis-tinction from the storks being that the bill is a in England; and Jaques being the commonest

a contemptuous expression for a common man. Jacquerie, an insurrection of the peasants. introduction of the word in the same sense into England seems to have led to the use of Jack as the familiar synonyme of John, which happened to be here the commonest name, as Jaques in France. The term was then applied to any mechanical contrivance for replacing the personal service of an attendant, or to an implement subjected to rough and familiar usage. Wedgewood's Dictionary of English Etymology. This will be found to explain the very varied use of this word, whether single or in composition; as boot-jack, jack-boots, black-jack (a leathern jug for household service). Jacket (the diminutive of Jack) is a short coat for homely nse

JACK, JAK, or JACA (Artocarpus integrifolia), a tree of the same genus with the Bread-fruit (q. v.), a native of the East Indies. It is a larger tree than the Bread-fruit, and has undivided leaves. The fruit is very large, weighing from five to fifty, sometimes seventy pounds. The fruit, which is produced in very great abundance, resembles the bread-fruit, but is of very inferior quality, the pulp having a strong unpleasant flavour; yet it forms great part of the food of the natives in some parts great part of the food of the natives in some parts of India, Ceylon, &c. The seeds, which lie imme-diately under the rind, are very palatable when reasted. The timber, which is yellowish, is used for almost every purpose, being both strong and ornamental, and is imported into Britain for making musical instruments, cabinet-work, the backs of brushes, marqueterie floors, &c. The J. is now much planted in many tropical countries of which it is not a native.

JACK-A-LANTERN. See IGNIS FATUUS.

JA'CKAL (corrupted from Sp. and Fr. chacal), the common name of a number of species and the common name of a number of species and varieties of the dog genus, abounding in many parts of Asia and Africa, but not found in any of the other quarters of the globe, except that one of the kinds extends into Greece. They agree in all their most important churacters with wolves and dogs, and many naturalists suppose that some of the domestic varieties of dog are of jackal parentage. The pupil of the eye is circular, as in the dog and wolf, although the form and tail are somewhat fexlike. The head is narrow, and the muzzle pointed. The ears are erect, and rather large. The tail is not so long as in foxes, but is almost equally bushy. All the jackals are of small size, as compared with

Jackal (Canis aureus).

wolves, seldom exceeding 15 inches in height at the shoulder. Their colours are buff and tawny, more or less grizzled; the tip of the tad is always dark. They make holes for themselves in the ground by burrowing, or take possession of such as already exist among rocks or ruins; and in these they spend the day, not venturing abroad till the dusk of evening. They hunt during the night in troops, employed to form a jackdaw's nest, in situations

and their howlings are described by all who have heard them as peculiarly horrible. The notion that the J. is the lion's provider, and guides the royal beast to his prey, is one of the exploded fables of patural history, although it may have some foundanatural history, atthough it may have some rounca-tion in the lion's occasionally following a troop of jackals in full cry, and appropriating 'the lion's share.' Jackals are not only ready to devour any animal which they can run down, but any carrion which they may meet with. They follow armies; they dig up the ill-buried dead; they rob hen-roosts and outhouses; but they are as omnivorous as domestic dogs, eating farinaceous or other vegetable food when it comes in their way; they are even said, like foxes, to enter vineyards, and devour the grapes. They have a very offensive smell, which, however, is said to diminish through domestica-tion, and they are domesticated without difficulty. The name of Common J. is sometimes given to the species (Canis gureus) which is found in the western parts of Asia, and which is in general vellowish gray above, and whitish below, with yellow legs and thighs. But it is doubted if this animal was in ancient times plentiful, as it is now, in Syria and neighbouring parts of Asia. It is thought not improbable that it may have followed the track of armies from the farther east. It is pretty certain that it has, in comparatively modern times, become common in parts of Asia more northern than it formerly inhabited. It is not improbable, however, that it is included under the name fox in the Hebrew Scriptures.

JA'CKASS, Laughing (Dacelo gigantea), a bird of the Kingfisher family (Halcyonidae), and sometimes described in works on natural history as the Great Brown Kingfisher. It agrees very nearly with the kingfishers in its form and characters, but differs from them in its habits, not frequenting waters, nor feeding on fish, but preying on beetles, reptiles, and small mammalia. It is about eighteen inches long, and mostly of a brown colour. It is a common bird in Australia, and has received its English name from the colonists, on account of the peculiar sounds which it utters. The natives call it Gogobera, apparently in imitation of its cry. It is of great use in preventing the excessive multiplication of reptiles and other pests. Its bill is powerful enough to crush the heads of snakes. It is easily tamed, and is sometimes kept in gardens, from which it does not seek to escape.

JACK-BOOTS, tall boots of tough thick leather, reaching above the knee, and formerly worn by cavalry. In some instances, as an additional protection against sword-cuts, they were lined with thin plates of iron. The only regiments in the British service which still retain these handsome but cumbrous boots are the Life Guards and Royal Horse Guards. See Boors.

JA'CKDAW (Corvus monedula), a species of crow, smaller than the rook and carrion crow, its utmost length being only about fourteen inches. It is black, with dark gray week. It is a common British bird, and is plentiful also in some parts of centi-nental Europe, Asia, and the north of Africa. It is not found in America. It builds its nest in holes of cliffs, ruins, &c. It frequents towns and villages, often making its nest in a chimney, by dropping down stick after stick till some of them become fixed in their oblique descent; and on these, others are piled, affording a firm base for a nest of wool or other soft substance. The J. lays from four to seven (usually five) bluish-white eggs, which are covered with dark-brown spots. Marvellous instances are recorded of the quantity of sticks

where an unusual height of pile was required. In 1842, a pair of jackdaws, in seventeen days, made a pile ten feet high in the staircase of the bell-tower of Eton College. The J. is a social bird. It is easily domesticated, and becomes very pert and familiar. It has considerable powers of mimicry, and even imitates the human voice.

JA'CKSON, a town of North America, capital of JACKSON, a town of norm America, capital of the state of Mississippi, is situated on a plain on the right bank of the Pearl River, which becomes navigable here, forty miles east of Vicksburg, and about 180 miles north of New Orleans by railway. Being the capital, it is the seat of several important being the capital, it is the seat of several important state institutions, as the lunatic asylum, institutions for the deaf and dimb, and the prison. Here, in average years, from 30,000 to 40,000 bales of cotton are shipped annually. Pop. in 1860, 3199.

JACKSON, a flourishing city in the state of Michigan, United States, situated on the left bank of the Grand River, 76 miles west of Detroit, and 38 miles S. by E. of Lansing, with both of which it is connected by railway. In the vicinity are numer-ons factories and mills of various kinds. Agricultural implements are extensively manufactured here, and there is a flourishing general trade. Within the city limits, there is a mine of bituminous coal; that material occurs also in the vicinity. Pop. in 1860, 4799

JACKSON, ANDREW, General, and seventh President of the United States of America, was bern at Waxhaw settlement, South Carolina, March 15, 1767. His father, who was a Scotchman by birth, emigrated to America in 1765, and soon afterwards died, leaving to his widow a half-cleared farm in a new settlement, with no negroes to assist in its cultivation. When J. grew up, he was sent to study for the church, but on the breaking out of the American revolution, he and his brothers were summoned to the field, and the elder lest his life at Stone Ferry. Andrew, though but thirteen years old, fought with his remaining brother under Sumter, and remained with the army until the end of the war. The life of the camp had ruined him for the clerical office, so in 1784 he commenced the study of the law, and in 1787 was appointed selicitor for the western district of South Carolina, now the state of Tennessee. This frontier settlement had for its neighbours several powerful tribes of Indians, against whom J. fought with such success as to get from them the complimentary titles of 'Sharp Knife' and 'Pointed Arrow.' In 1796, he was a member of the convention which modelled the constitution and organised the state of Tennessee, and was elected to the legislature as representative, and then as senator, and appointed judge of the supreme court (an office he seen resigned), and major-general of the state militia. In IS13, at an outbreak of hostilities with the Creek Indians, he raised a volunteer force of two or three thousand men, and defeated them. When destitute of supplies, he is said to have set an example of endurance by he is said to have set an example of endurance by feeding on hickory-nuts, and hence, according to some, to have acquired the popular sobriquet of 'Old Hickory', J.'s final victory (March 27, 1814) at the Horseshoe peninsula, in the Tallahoosa, completely broke the power of the Indian race in North America. In consequence of his skill and energy in Indian warfare, he was appointed a major-general of the army of the United States; flattering to the pride of Americans, gave General literature.

J. a great and enduring popularity. After Spain had ceded Florida to the United States, he was made governor of the territory, and subsequently was chosen United States senator from Tennessee. In 1824, he received the highest vote of four can-In 1824, he received the highest vote of four candidates for the presidency of the United States, but by the influence of Mr Clay, John Quincy Adams was elected by the House of Representatives. He was, however, in spite of bitter and vicient opposition, elected by the democratic party in 1828, and in 1832 re-elected by a still more overwhelming majority. His administration was marked by singular firmness. He vetoed important measures against large majorities, and after a long struggle, destroyed the Bank of the United States, and took the first steps towards a specie currency and independent treasury. But he manifested too much, perhaps, of a partisan spirit in removing nearly all his political opponents from office, and appointing his supporters—an example followed by his successors of both parties, and which has led to wide corruption. His administration, as a whole, was successful, and he retired with undiminished popularity, after witnessing the election of his favourite, President Van Buren. He died at his farm of the Hermitage, near Nashville, June 8, 1845.

JACKSON, T. J., a general in the Confederate army, was born in Virginia in 1826. J. entered West Point in 1842, and graduated in 1846. During the Mexican War he was attached to Magruder's battery, and was made a captain for gallantry at Contreras, Chapultepec, and Churubusco. He retired from the army in 1852, and became Professor of Military Science in the Virginia Military Institute. At the battle of Bull Run, July 21, 1861, he commanded a brigade; and the firmness of his troops earned him the well-known title of 'Stonewall Jackson.' In May, 1862, he attacked Gen. Banks at Front Royal, and drove him up the Shenandoah Valley and across the Potomac. He was in turn pursued by Frémont, Shields, and Banks, but escaped, and united his division to the army under Lee, at Richmond, enabling that general to defeat the army under McClellan. Upon the invasion of Maryland, J.'s division operated against Harper's Ferry, which was captured Sept. 15, 1862. He died of wounds received from his own men at Chancellorsville, May 9, 1863.

JA'COB (Heb. Yaakob, derived variously from 'heel,' Gen. xxv. 26, or from 'to deceive,' Gen. neer, Gen. xxv. 26, or from 'to deceive,' Gen. xxvii. 36), one of the three chief Hehrew patriarchs. He was the second son of Isaac and Rebekah, and en account of his docile, domestic character was the favourite of his mother. His conduct towards his brother in regard to the birthright (Gen. xxvii.) does not greatly redound to his credit. After an exile of 21 years in Padanaram, whither he had fled to escape the vengeance of Esau, he returned to Canaan with two wives (Rachel and Leah), two concubines (Bilhah and Zilpah), twelve sons (the fathers of the subsequent Hebrew tribes), and a daughter named Dinah, who was the unintentional cause of a vindictive massacre of the Shechemites by her brothers Simeon and Levi. In his 130th year, he and his family went down to Egypt, where his favourite son Joseph had become a great man under Pharaoh. Here he lived for 17 years longer in the land of Goshen, and died in his rear source in the same of the United States; 147th year. His body was embalmed, carried back and in the contemporaneous war with England had to Canana with great pomp by his sons, and there command of the forces which captured Feassooth, buried near Hebron. Mention is frequently made command of the New Orleans (q. v.) against the of J. both in the Old and New Testaments, and attack of the British under General Fackenham, there are also many legends about him in Rob-December 1814. The result of this action, so binical and Patristic, as well as in the Mohamedon.

JACO'BI, FRIEDRICH HEINRICH, a German philosopher, born at Düsseldorf, 25th January 1743. He was educated at Frankfurt, whence he proceeded to Geneva with a view to preparing himself for a mercantile career. In 1770, he was appointed councillor of finance for the duchies of Berg and councillor of manner for the ducines of Derg and Jülich, and having married a lady of fortune, was enabled to devote himself to literary pursuits. In 1804, he removed to Munich, where he had been appointed a member of the newly instituted Academy of Sciences, of which he became president in 1807. He died on March 10, 1819. His writings consist partly of romances, and partly of philosophical treatises. The principal are Woldemar (2 vols. Flensb. 1779), Eduard Allwill's Briefsammlung (Bresl. 1781), both philosophical romances; Ueber die Lehre des Spinoza in Briefen an Mendelssohn (Bresl. 1785), a polemic against logical methods of speculation in the search after the higher class of moral truths; and David Hume über den Glauben, oder Idealismus und Realismus, in which the same polemic is continued, but in which an attempt is also made to demonstrate that the mind or nature of man possesses another faculty-viz. faith, or moral intuition, by which the higher truths are as firmly grasped, as, by faith in the perceptions of the senses we, so to speak, Ly hold on the phenomena of the material world. Herein lies the difference between Kant (and indeed the whole school of German idealists) and J.; the former appear to admit only the 'subjective' reality of such conceptions as God, the soul, immortality, &c.; the latter claims for them an 'objective' reality. Kant denies that the 'faculty of faith' gives us 'knowledge,' in the strict sense of the word; J. affirms that it does, Oue of his treatises, I'on den güttlichen Dingen und ihrer Offenbarung (Leup. 1811), was the occasion of a rather sharp controversy between him and Schelling. J. is not a systematic thinker, and did not form a school. He is, as might be expected, delicient in the qualities he despised-method and logical sequence; but his style is remarkably good, possessing both warmth and clearness. It has been compared by his countrymen to that of Plato. His collected works appeared at Leinsic (6 vols. 1812-

JACO'BI, KARL GUSTAV JAKOB, a celebrated mathematician, was born at Potsdam, in Prussia, 10th December 1804; studied at the university of Berlin, where he made great progress in philosophy, philology, and mathematics; and in 1829 became a professor at Königsberg. In 1829, he published his celebrated work Fundamenta nova Theorice Functionum Ellipticorum, for which he received the great medal of the Academy of Sciences of Paris; the work, however, only contains a portion of his researches on the subject of Elliptic Functions. researches on the subject of Linjure Fintensia. In the same year, he made a tour through Northern Germany and France, forming the acquaintance of Gauss, Legendre, Fourier, Poisson, and other celebrated geometers. In 1842, he took a second journey, in company with his wife, to visit England and Scotland, and attend the meeting of the British Association. Soon offers his column of the British Association. Soon after his return home, his health broke down, and he started for Italy. On his return, he was removed from Roningsherg to Berlin, where he died of small-pox, 18th February 1851. Beside the work above men-tioned, J. wrote a great number of memoirs on the different branches of the higher mathematics, chiefly Series and Definite Integrals, and was a regular contributor to the celebrated Journal für reine und angewandte Muthematik of Crelle.

JA'COBIN, the name by which members of the

The name originated from the fact, that their motherestablishment was situated in the Rue St. Jacques, in Paris; and it was thence extended to the entire order throughout France.

JA'COBINS, the members of a political club which exercised a very great influence during the French Revolution. It was originally called the Club Breton, and was formed at Versailles, when the States-general assembled there in 1789. It then consisted exclusively of members of the States-general, all more or less liberal or revolutionary, but of very different shades of opinion. On the removal of the court and National Assembly to Paris, this club began to acquire importance. It now met in a hall of the former Jacobin convent in Paris, whence it received the name of the Jacobin Club, which was first given to it by its enemies; the name which it adopted being that of the Society of Friends of the Constitution. It now also admitted members who were not members of the National Assembly, and held regular and public sittings. It exercised a great influence over the agitation, of which the chief seat and focus was in the capital, and this influence was extended over the whole country by affiliated societies. Its power increased, until it became greater than that of the National Assembly. It formed branch societies or clubs throughout France, of which there were soon not less than 1200. When the National Assembly dissolved itself in September 1791, the election of the Legislative Assembly was mainly accomplished under the influence of the Jacobin Chib, Almost all the great events which followed in rapid succession were determined by the voice of the club, whose deliberations were regarded with more interest than those of the Legislative Assembly. It reached the zenith of its power when the National Convention met in September 1792. The agitation for the death of the king, the storm which destroyed the Girondists, the excitement of the lowest classes against the bourgeoisie or middle classes, and the reign of terror over all France, were the work of the Jacobins. But the overthrow of Robespierre on the 9th Thermidor 1794, gave also the deathblow to the Jacobin Club. The magic of its name was destroyed; and the Jacobins sought in vain to contend against a reaction which increased daily both in the Convention and among the people, A law of October 16 forbade the affiliation of clubs. and on November 9, 1794, the Jacobin Club was finally closed. Its place of meeting was soon after demolished .- The term Jacobins is often employed to designate persons of extreme revolutionary sentiments.

JA'COBITES, in Church History, is the common name of the oriental sect of Monophysites (q. v.), but it belongs more specially to the Monophysites of Syria, Mesopotamia, and Chaldea. The name is derived from a Syrian monk called Jacobus Bara-deus (Bar-dai), who in the reign of Justinian formed the Monophysite recusants of his country into a single party. The J. at present number about 40,000 families, and are subject to two patriarchs, appointed by the sultan—one resident the other at Saphran, under the style of Patriarch of Jerusalem.

JACOBITES (from Jacobus, the Latin form of James), the name given to the adherents of the male line of the House of Stuart in Great Britain and Ireland after the Revolution of 1688, Many of the most devoted royalists followed James II. into France; but the greater part of the J. remaining in their native land made a greater or Dominican order were popularly known in France, less show of submission to the new government, whilst they sceretly supported the cause of the Pretender. Their intrigues and conspiracies were incessant till the middle of the 18th century. Their hostility to the House of Hanover broke out in rebellions in 1715 and 1745, in consequence of which not a few of them lost their lives upon the scaffold, titles were attainted, and estates confiscated. After 1745, their cause became so obviously hopeless, that their activity in a great measure ceased; and it was not long till it ceased altogether, and those who still retained their attachment to the exiled family acquiesced in the order of things established by the Revolution. In Scotland, the hopes and wishes of the Jacobite party were expressed in many spirited songs, which form an interesting part of the national literature. See the Culloden Papers (Lond. 1815): Hogg's Jacobite Relics (2 vols. Edin. 1819); aud Chambers's Jacobite Memoirs (Edin. 1824).—
The J. of England were also called Tories. They were generally distinguished by warm attachment to the Church of England, as opposed to all dissent, if they were not members of the Church of Rome, and held very strongly the doctrine of non-resistance, or the duty of absolute submission to the king. The J. of Scotland were also generally Episcopalians and Roman Catholics. Macaulay, however, points out that the Highland clans which espoused the out that the right and the right and the Jacobite cause did so on other grounds than the English J., and were far from having previously received the doctrine of non-resistance. In Ireland, the Jacobite cause was that also of the Celts as opposed to the Saxons, or the native race against the English colonists, and at the same time of the Roman Catholics against the Protestants. These Roman Catholics against the Protestants. diversities prevented a complete union, and greatly weakened the Jacobites. Further information will be found in a *History of the Rebellion in* 1745, by R. Chambers.

JACOB'S LADDER, in a large vessel of war, is the short rope-ladder, with wooden steps, which slopes inward from the lower portion of the main and fore shrouds to the upper deck. It gives easy access to the shrouds, and thence to the tops.

JACOB'S LADDER (Polemonium corruleum), a herbaceous perennial plant of the natural order Polemoniaceæ, a rare native of Britain, but more common in the centre and south of Europe, found also in the temperate parts of Asia and of North America. It has long been a favourite and very common plant in flower-gardens in Britain. It has pinnate leaves, with ovato-lanceolate leaflets, a smooth stem 1-24 feet high, and a terminal raceme of bright blue (sometimes white) flowers, with wheelshaped 5-lobed corolla. The plant known as Jacob's ladder in the Eastern United States is the Polemonium reptans, which is smaller and fewer-flowered than the above. It is to be found in many cottage gardens.

JACOTOT, JEAN JOSEPH, the inventor of the 'Universal Method' of education, was born at Dijon, in France, in 1770. He served for some time in the army, but in 1790 was appointed by Napoleon, first to the chair of mathematics in the Normal School, afterwards secretary to the Minister at War, and a director of the Polytechnic. He retired to Belgium in 1815, where he was appointed lecturer on French literature in the university of Louvain, and afterwards director of the military Normal School. He returned to Paris in 1838, and died there 30th July 1840. His system, propounded in general rules, which, however, without his own explanation, would have been quite unintelligible, appears to consist in directing the student's exertions to particular subjects, encouraging and inciting him in every possible manner to make use of his mental powers, and there leaving him; the teacher or varied colours, it is necessary, instead of raising

is on no account to become an expounder, but after setting the student on the right track, is to leave him to explain away his own difficulties. J.'s method very much resembled that of Hamilton (see Hamiltonian System), and, like it, was crude and one-sided. The valuable elements of it have been incorporated in the more rational and catholic methods of recent times. The wonderful results said to have been produced by J. are, so far as real, to be attributed to the exceptional zeal and energy that always characterise the apostle of a new system, as much as to the system itself.

JACQUA'RD LOOM, a loom fitted with the Jacquard apparatus for the purpose of pattern-weaving. This apparatus was the invention of M. Joseph Marie Jacquard, an ingenious Frenchman, a native of Lyon, who, being necessitated to carry on the weaving business of his father, for which he had a distaste, and, according to some accounts, still further stimulated by reading an account in an English newspaper of the offer of a premium for any person who should invent a machine for weaving nets, set his wits to work to improve the existing machinery for weaving. By his invention, he enabled an ordinary workman, with comparative ease, to produce the most beautiful patterns in a style which had only previously been accomplished with almost incredible patience, skill, and labour. Nevertheless, the reception of his great invention by the public was most dispiriting, for although rewarded with a small pension by Napoleon, the silk-weavers themselves offered such violent opposition to its introduction, that on one occasion he narrowly escaped with his life, and his machine was broken up by the body of men who, under the title of the Conseil des Prnd'hommes, were appointed to watch over the interests of the Lyonnese traders, to waten over the interests of the Lyonness trauers, and it was destroyed in the public square of Lyon. To use Jacquard's own language: "The iron was sold for iron, the wood for wood, and he himself was delivered over to universal ignominy;" nevertheless, on that same spot where the machine was publicly destroyed, a statue now stands, to shew the gratitude of a more enlightened generation.

Even after the partial adoption of his machine, which was patented, Jacquard had numberless annoyances to contend with; the workmen, as usual, opposed ignorant prejudice to its progress, and their masters, little better, took it up so lukewarmly, that it failed in many instances, and actions were entered against the patentee for injury done to material, &c. The value of the invention was, however, too great to admit of its being long suppressed, and when its value was once fairly recognised, it effected a complete revolution in the art of weaving, especially in the finer kinds of figured silk fabrics.

The Jacquard apparatus can be adjusted to almost every kind of loom, its office being merely to direct those movements of the warp threads which are required to produce the pattern, and which pre-viously were effected by the weaver's fingers; its arrangements generally are very complicated, but its principles are remarkable for their extreme simplicity and certainty.

In ordinary weaving, the alternate threads of the warp, or longitudinal arrangement, are raised so as to enable the weaver to throw the shuttle containing the weft thread transversely across from his right to his left hand between the warp threads so raised and those left at rest. When the weft is so passed through, the raised warp threads are lowered, and the other set raised, the shuttle being then passed through from left to right. This is the most simple idea of plaiting or weaving. If, however, a pattern has to be produced either in plain materials and depressing the whole threads of the warp, in two sets, as above described, to raise only such as are required to develop the various parts of the figure, and this, of course, must be done with great exactness, as the position of every thread tells upon the formation of the pattern. The apparatus of Jacquani is for the purpose of regulating these movements, and its mode of action is as follows:

The warp threads are each (as in the common wearing process) passed through a small loop in the lifting thread, so as to be raised by means of the treadles, which act directly upon the lifting bars; these lifting threads ($[i]_1, i_2, i_3, i_4$) are attached

to certain wires in the Jacquard appearans, which form a rigid continuation ending in a shock, which, when nothing interferes, is caught and raised by each upward motion of the litting bar, thus, A is the litting bar, thus, A is the litting bar, and it has five projections (k,k,k,k,k), more which the hooks of the wires catch when in a straight position, as at B, B, but which miss them if they be thrown out of the perpendicular, as at C, C, C. There are only five of these wires given, to prevent confusion, but practically there must be one for every thread of the warp—that is, one for every thread of the warp—that is, one for every thread in the width of the cloth to be woren. Each of the lifting wires passes through a borizontal needle placed at right angles, D, D, D, D, D, which has a loop formed for the purpose, thus, at $(\mu_B, 2)$. This needle passes freely through an

opening in the frame at h, and is so looped on to mucher rod, g, on the spring-box F, that it moves freely without fear of duphacement, and if pushed back into the spring-box, is made to press upon one of the spiral springs E, which restores it to its place as soon as it is irred from pressure. In the diagram (log. 1), this pressure is supposed to be consequently, if the lifting place A is simultaneously raised, those three wires are missed, whilst the other vog, B, B, being in position, eatch the projections k, k on the bar, are drawn up with it, and thus raise the threads of the warp to which they are attached.

Now, the regulation of this pressure upon the horizontal needles is effected by a revolving square roller, which has each of its four sides perforated with rews of holes, which, like the needles and lifting wires, correspond in number to the threads of the warp. This roller, when in its place, receives inte one row of perforations the whole row of needles where they project through the frame at h, and it has a motion given by the machinery which brings each row on its four surfaces in regular order into the same position, and if no impediment is offered, all the needles are undisturbed, and the upright wires lift the entire set of warp threads to which they are attached. But in order to produce the necessary variations of motion required by the pattern, a set of cards are made each of the width of the square roller; these also are so perforated that when placed on the surface of the roller their perforations correspond exactly with those on the roller immediately beneath them; but the cards are perforated in exact accordance with the pattern, so that intervals occur in which there are no perforations to correspond with those on the roller; hence, when the roller L (fig. 1) is brought up to the frame h, some of the needles will find entrance into the holes of the roller through the corresponding perforations in the covering card, seen in section M, fig. 1; but others will be prevented entering by the absence of such perforations, and the card, by the resistance it offers, will force the needles thus opposed back upon the springs E, E, E, removing thereby the hooks of the lifting wires from the action of the lifting bar. The cards are looped together at the corners, and move as an endless chain on the rollers, and the entire set of perforations on the whole chain of cards exactly represents the pattern to be produced; the same as the notes represent the air in a piece of music. Of course, the simple operations here described require mechanical arrangements of great nicety to regulate them, and these are so complicated that more verbal description would hardly help much to explain them; indeed, even with the loom and its apparatus, and its cumbrons arrangement of hundreds, and even thousands of cards before us, the unpractised eye finds great difficulty in comprehending its movements.

A very wonderful simplification of the Jacquard apparatus was shewn in the International Exhibition (1862), by Eugenio Vincenzi of Modena, by which a saving of bulk alone is effected to the extent of two-thirds, and the toil of the artisan is lessened greatly by the corresponding lightness of the parts of the machine which he has to move, The most remarkable part of this new invention is the extreme delicacy of the needle action, so that there is no shock when the card offers resistance. hence the inventor has been enabled to substitute paper for thick cardboard, and can consequently perforate a dozen with the same case as one, hence the pattern may be repeated without extra labour. This beautiful little loom will certainly displace the ordinary Jacquard, if it is not itself superseded by the wonderful invention of the electric loom by Signior Bonelli, for a description of which see WEAVING.

JACQUELITE (see JACK), the name given to the insurgent peasants in France in the middle of the 14th c., in the reign of John. The insurrection of the J-broke out in the year 1358, when the French king was a prisoner in England, and France in a state of the greatest disorder and nanrely. The immediate occasion of it was the enormities

perpetrated by Charles the Bad, king of Navarre, peninsula at the north extremity of the island, with and his afterents; but it was really caused by long a peop of 8000. The place is of Dutch origin, continued oppression on the part of the nobles; and a large proportion of the population of Dutch Souldenty rising against their forst, the pessants descent. laid hundreds of castles in ruins, murdered the nobles, and violated their wives and daughters, practising every enormity, and acting, as they said, on the principle of doing as had been done to them. The insurrection broke out in the neighbourhood of Paris, but extended to the banks of the Marne and the Oise. For some weeks this part of France was entirely at their mercy; but the magnitude of the danger induced the quarrelsome nobles to make common cause against them. and on the 9th of June the peasants were defeated with great slaughter near Meaux by Captal de Buch and Gaston Phébus, Count of Foix. This put an end to the insurrection.

JACTITA'TION OF MARRIAGE is a suit which was formerly competent in the English ecclesiastical courts, and now is competent in the English Divorce Court, to settle a question of disputed marriage. If a party boast or profess that he or she is married to another, the latter may institute the suit, and call upon the former to produce proof of the marriage. If this is not done, then a decree passes which enjoins the party to perpetual silence on the subject. This remedy is now scarcely ever resorted to, for, in general, since Lord Hardwick's Act (1766), there is sufficient certainty in the forms of legal marriage in England to prevent any one being in ignorance whether he or she is really married or not-a reproach which, however, is often made against the law of Scotland. The Scotch suit of a declarator of putting to silence, which is equivalent to jactitation of marriage, is often resorted to, the latest and most notorious instance of its use being that in the Yelverton marriage case.

JADE, a name somewhat vaguely applied to a number of minerals, not very dissimilar—nephrite, axestone, serpentine, &c. Nephrite and axestone axestond, serjentinic, &c. Aspinitie and axestone appear to be the minerals of which Jude formaments are generally made. But Yv, or Chinese J., of which very beautiful vases and other articles are made in China, is supposed to be Prehnite (q. v.). J. of all kinds has a greenish colour, and when polished, has a rather dull and greasy aspect.

JAEN, formerly an independent Moorish kingdom, is now a province of Spain, forming a portion of the old province or kingdom of Andalusia (q. v.). It lies wholly within the basin of the Guadalquivir. Area, 5184 square miles; pop. in 1864, 379,419. Con-quered by the Moors on their entrance into Spain, J. maintained its independence as a Moorish state till 1234, when it fell into the hands of Ferdinand III., and was added to the kingdom of Castile

JAEN, a city of Spain, capital of the province of the same name, is most picturesquely situated in a mountainous district, at the foot of a rugged castle-crowned hill, on the Rio de Jaen, a tribucastic-crowned full, of the rate as daen, a trunk tary of the Guadalquivir, about 50 miles north of Granada. It is surrounded by old Moorish walls, surmounted by numberless towers and pinnacles. Though situated in the midst of plenty, in a fertile neighbourhood, the town is poor. The principal buildings are two cathedrals and several hospitals, Outside the walls are demandered by the con-Outside the walls are charming well-watered fruitgardeus. Pop. 22,938. In former times, the town was called Jayyenu-t-harir, 'Jaen of the Silk,' on account of its silk manufactures, for which it was, but is no longer, famous.

JA'FFA. See JOPPA.

JAGE'LLONS, THE, the name of an illustrious dynasty which reigned in Lithuania, Poland, Hun-gary, and Bohemia. The name is derived from Jagellou, the last of a long line of hereditary grand dukes of Lithuania, who succeeded to his patri-monial possession in 1381, and was (1386) appointed successor to his father-iu-law, Lewis the Great, king of Poland and Hungary, in the former of these kingdoms, after having embraced Christianity, and changed his name to Wladislas IV. He was engaged during the whole of his reign in repelling the attacks of the Tentonic Knights, whom he finally overthrew by the help of the Hussites of Bohemia. He made an unsuccessful attempt to wrest Hungary from the Emperor Sigismund, founded the university of Cracow in 1400, and died in 1434 at Grodek. His son, Wladislas V., king of Poland (1434-1444), was also elected king of Hungary on the death of Albert of Austria in 1439, mainly through the assistance of John Hnuyady (q. v.), vaivode of Transylvania. After a war of two years' duration with the Emperor Frederick III., Wladislas turned his sword against the Turks, drove them repeatedly from Moldavia, Wallachia, and Bulgaria, and returned to his capital of Buda leaded with spoils. In 1444, Amurath II. sucd for peace, which the warlike Wladislas granted, swearing a solemn oath by the Holy Evangelists; but the pope having, in defiance of all truth and equity, sent Cardinal In uchance of all truth and equity, sent Cardinal Julian to cause a rupture of the treaty, and alsolve Wladislas from perjury, that gallant prince summoned to his side John Hunyady, and being joined by Scanderbeg, at the head of an auxiliary force of Epirotes, invaded Turkey, but was totally defeated and the state of the process invaded Turkey, but was totally defeated and slain at Varna (November 10, 1444); Cardinal Julian being also left dead on the field. He was succeeded in Poland by his brother Casimir (1441-1492), whose three sons, John Albert (1492-1501), Alexander (1501-1506), and Sigismund (1506-1548), reigned in succession. Sigismund August (1548-1570), the son of this last, and one of the wisest of the Polish monarchs, added Livonia to his kingdom, and passed an edict of universal toleration. His sisters, Anne and Catherine, married respectively Stephen Bathory of Transylvania, and John III. of Sweden, and the Jagellon dynasty was continued on the Polish throne till 1668.

Wladislas, the fourth son of Casimir IV. of Poland, was elected king of Bohemia in 1471, on the death of George Podichrad, and also succeeded Mathias Corvinus in Hungary in 1490. Wladislas died in 1516, and was succeeded in both kingdoms by his son, Lewis II., who was defeated and slain by the Turks at Mohacs (29th August 1526), and with whom terminated the Jagellons of Bohemia and Hungary.

JA'GER. See SKUA.

JA'GERNDORF, a small town of Austriao Silesia, is situated on the Oppa, 14 miles north-north-west of Troppau, has manufactures of cloth, hosiery, and linen. Pop. 6000.

JAGGERNAU'T, or JAGGERNAUT PURI, or PURI, is the name of a town in Orissa (85 54' long., and 19° 45' lat.), celebrated as one of the chief places of pilgrimage in India. It owes its reputation to a temple erected there in honour of Vishnu, and containing an idel of this Hindu god, called Jaggernaut (commonly Juggernaut), a corruption of the Sanscrit word Jagannatha, i. e., lord of the world. JAFFNAPATA'M, a scaport in Ceylon, on a According to a legend related in the Ayeen Akbery,

a king desirous of founding a city sent a learned branches, making even monkeys its prey. Instances Brahman to pitch upon a proper spot. The Brah-man, after a long search, arrived upon the banks occur, are not frequent, but it is bold enough to of the sea, and there saw a crow diving into the water, and, having washed its body, making obeisance to the sea. Understanding the language of the birds, he learned from the crow that if he remained there a short time, he would comprehend the wonders of this land. The king, apprised of this occurrence, built on the spot where the crow had appeared a large city and a place of worship. The Rajah one night heard in a dream a voice saying: 'On a certain day, cast thine eyes on the seashore, when there will arise out of the water a piece of wood 52 inches long, and 11 cubits broad; this is the true form of the deity; take it up, and keep it hidden in thine house seven days; and in whatever shape it shall then appear, place it in the temple, and worship it.' It happened as the Rajah had dreamed, and the image called by him Jagannatha became the object of worship of all ranks of people, and performed many miracles. According to another legend, the image arising from the water was an avatara or incarnation of Vishnu; it was fashioned by Vis'wakarman, the architect of the gods, into a fourfold idol, which represented the supreme deity, and the temple itself was erected over it, and inaugurated by the god Brahma and his divine court. The present temple was finished in 1198 A.D., under the government of the celebrated Rajah of Orissa, Anang Bhim Deo. Whether the worship of Jaggernaut was originally one in honour of Vishuu or not, may be doubtful. The notoriety it has gained is due especially to the fanaticism which induced, and still induces, thousands of Hindu believers to sacrifice their lives, in the hope of attaining eternal bliss, by throwing themselves under the wheels of the chariot which carries in procession the idol of the god. It is just, however, to state that this practice, which in former times prevailed to a fearful extent, is greatly abating in our days.

JA'GGERY, the name given in the East Indies to the sugar obtained by inspissation from the sap (nera or toddy) of palms. The sap of many species of palm yields jaggery, and probably that of almost all species might be made to yield it. The cocca-nut yields much of the jaggery of some parts of the East. It is, as generally sold and used in the East Indies, a coarse kind of sugar; chemically, it is the same with cane-sugar. The sap, which by inspissation yields jaggery, becomes also, by fermentation, palmwine, and from it by distillation arrack is made.

JAGUA'R (Felis onca), one of the largest of the cat tribe, and by far the most powerful and dangerous of the American heasts of prey. It is sometimes called the American Tiger. It is nearly equal to the tiger in size; the head is large, the hody thick, and the limbs robust; the tail is long, and of equal thickness throughout. The colour varies considerably, but is usually a rich yellow, with large black spots and rings, small black spots generally appearing within the rings, a mark by which the skin of the J. may be readily distinguished from that of the other large spotted or riaged Felidæ. A black or very dark-brown variety occurs, but the characteristic markings may be seen in certain lights, deeper in colour than the rest of the fur. The J. is strong enough to drag away a horse, and swift enough to capture horses on the open pampas. It is chiefly, however, an inhabitant of forests. It abounds so much in some districts, that settlements have been deserted on account of the destruction of domestic onimals. It climbs trees, however smooth the stem, and moves about with great agility among the

Jaguar (Felis onca).

approach enclosures, and even to enter villages in broad daylight, in quest of prey. The J. is often taken in traps; and it is sometimes hunted with dogs, when it generally at last takes refuge in a tree, and is there shot. The skins of jaguars are exported from South America in great numbers. The J. is found in almost all parts of South America, but its range does not extend north of the Isthmus of Darien. It is called OUNCE (Onça) in some parts of South America.

JAHN, Johann, a distinguished Roman Catholic orientalist and biblical critic, was born at Tass-witz, in Moravia, June 18, 1750, received his early education at Znaim and Olmütz, and in 1772 entered the Premonstratensian convent of Bruck, where he took his vows in 1774, and was appointed Professor of Oriental Languages and Biblical Criticism. On the suppression of this convent, in 1784, J. was transferred to the same professorship in Olmütz, and finally to the university of Vienna, where he also undertook the chair of Dogmatic Theology. So far as regards the Roman Catholic literature of Germany, J. may be regarded as the father of biblical criticism. But the boldness of some of his opinions having aroused the alarm of the ecclesiastical authorities, he was honourably removed from his chair in thes, ne was monutably removed them in contain the university, by being promoted to a canoary of St Stephen's at Vienna, in 1803. He continued, however, to pursue the same studies with great reputation till his death in 1816, and published many works in both departments, the most important of which, passing over his grammars, lexicons, and elementary books of the Hebrew, Syriac, Chaldaic, and Arabie languages, are his Introduction to the Old Testament, 2 vols. 1792, and again in 4 vols. 1802-1803; Biblical Archivology, 5 vols. 1797-1805, of 1805, Induced Archeology, 5 vons. 1797—1803, of both which works a compendium appeared in 1804, and again in 1814; a Manual of General Hermeneutics, 1812; an Appendix of Dissertations to this work, 2 vols., in 1813—1815; and an edition of the Hebrew Bihle, 4 vols. 1806. Five years after his death, a collection of posthimous Remains was published at Tübingen, 1821, the genuineness of which, although seemingly without reason, has been called in question. His works have gone through many editions in Germany, and have been translated into several languages.

JAIL FEVER (known also as Putrid or Pestilential Fever) is now considered to be merely a severe form of Typhus Fever (q. v.), and not a distinct disease. At the present time, owing to improved sanitary regulations, this form of disease is almost unknown; but we learn from Howard's

Account of the State of Prisons, that, in his time, the disease was very frequent in the prisons of England, although unknown in those of the continental countries. In the celebrated Black Assize (q. v.), held at Oxford in 1577, there is no evidence (q. v.), and at Oxford in 1971, there is no evalence that the disease prevailed amongst the prisoners, and yet it broke out among the persons present at the trial. It is little more than a century ago (May 1750) that the lord mayor, an alderman, two judges, most of the jury, and a large number of spectators, caught this disease from attending the assizes at the Old Bailey; and many of those who were infected died.

JAI'NAS is the name of a heterodox sect of the Hindus, numerous adherents of which are found in every province of Upper Hindustan, in the cities along the Ganges, and in Calcutta, but more especially to the westward; the provinces of Mewar and Marwar being apparently the cradle of the sect. They are also numerous in Guzerat, in the upper Incy are also dumerous in Guzerat, in the upper part of the Malabar coasts, and are scattered through-out the peninsula. They form a large, and, from their wealth and influence, an important division of the population of India. The name of the sect means a follower of Jina, the latter being one of the denominations of their deified saints; and as another name of these saints is Arhat, their followers are

also called Arhatas.

The tenets of the J. or Arhatas are in several respects analogous to those of the Buddhists (see BUDDHA), but they resemble in others those of the Brahmanical Hindus. With the Buddhists, they share in the denial of the divine origin and authority of the Veda, and in the worship of certain saints, whom they consider superior to the other beings of their pantheon. They differ, indeed, from them in regard to the history of these personages, but the original notion which prevails in this worship is the With the Brahmanical Hindus, on the other same. With the Brahmanical Hindus, on the other hand, they agree in admitting the institution of caste, in performing the essential ceremonies called Sanskaras (q. v.), and in recognising some of the subordinate deities of the Hindu pantheon, at least apparently, as they do not pay especial homage to them, and as they disregard completely all those Brahmanical rites which involve the destruction of animal life. It deserves notice, too, that though rejecting in general the authority of the Vedas, they admit it, and quote the Vedic texts, if the doctrines of the latter are conformable to the Jaina tenets.

According to their doctrine, all objects, material or abstract, are arranged under nine categories, called Tattwas, truths or principles, of which we need notice only the ninth and last, called Moksha, or liberation of the vital spirit from the bonds of action-i. e., of the vital spars from the bonds of action—I set final emancipation. In reference to it, the J. not only affirm that there is such a state, but they define the size of the emancipated souls, the place where they live, their tangible qualities, the duration of their existence, the distance at which they are from one another, their parts, natures, and numbers. Final emancipation is only obtained 'in the state of manhood (not in that of a good demon or brute), while in possession of five senses, while possessing a body capable of voluntary motion, in a condition of possibility, while possessing a mind, through the sacrament of the highest asceticism, in that path of rectitude, in which there is no retrogression, through the possession of perfect know-ledge and vision, and in the practice of abstinence. Those who attain to final liberation do not return to a workly state, and there is no interruption to their blus. They have perfect vision and knowledge, and do not depend on works. See J. Stevenson, The Katpa Stára, and Nava Tattwa. The principles of faith, as mentioned before, are

common to all classes of J., but some differences occur in the practice of their duties, as they are divided into religious and lay orders, Yatis and Sydvakus. Both, of course, must place implicit belief in the doctrines of their saints; but the Yata has to lead a life of abstinence, taciturnity, and continence; he should wear a thin cloth over continence; he should wear a thin cloth over his mouth, to prevent insects from flying into it, and he should carry a brush to sweep the place on which he is about to sit, to remove any living creature out of the way of danger; but, in turn, he may dispense with all acts of worship; whilst the Syacuka has to add to the observance of the whiceus and moral during the of the religious and moral duties the practical for the religious and moral duties the practical worship of the saints, and a profound reverence for his more pious brethren. The secular Jaina must, like the ascetic, practise the four virtues -liberality, gentleness, piety, and penance; he must govern his mind, tongue, and acts; abstain, at certain seasons, from salt, flowers, green fruits, roots, honey, grapes, tobacco; drink water thrice strained, and never leave a liquid uncovered, lest an insect should be drowned in it; it is his duty also to visit daily a temple where some of the images of the Jaina saints are placed, walk round it three times, make an obeisance to the image, and make some offerings of fruits or flowers, while pronouncing some such formula as 'Salutation to the Saints, to the Pure Existences, to the Sages, to the Teachers, to all the Devout in the world.' The reader in a Jaina temple is a Yati, but the ministrant priest is not seldom a Brahman, since the J. have no priests of their own, and the presence of such Brahmanical ministrants seems to have introduced several innovations in their worship. In Upper India, the ritual in use is often intermixed with formulas belonging more properly to the S'aiva and S'akta worship (see Hindu Sects under India), and images of S'iva and his consort take their place in Jaina temples. In the south of India, they appear, as mentioned before, to observe also all the essential rites or Sanskâras of the Brahmanical Hindu. The festivals of the J. are especially those relating to events in the life of their deified saints; but they observe also several common to other Hindus, as the spring festival, the S'ripanchami, and others.

The J. are divided into two principal divisions, Digambaras and Swettimbaras. The former word means 'sky-clad,' or naked, but in the present day, ascetics of this division wear coloured garments, and confine the disuse of clothes to the period of their meals. Swettimbara means one who wears white garments; but the points of difference between these two divisions are far from being restricted to that of dress: it is said to comprehend a list of 700 topics, of which 84 are considered to be of paramount importance. Amongst the latter are mentioned the practice of the Swetambaras to decorate the images of their saints with earrings, necklaces, armlets, and tiaras of gold and jewels; whereas the Digambaras leave their images without ornaments. Again, the S'wetambaras assert that there are twelve heavens and sixty-four Indras; whereas the Digam-baras maintain that there are sixteen heavens and one hundred Indras. In the south of India, the J. are divided into two castes; in Upper Hindustan, they are all of one caste. It is remarkable, however, that amongst themselves they recognise a number of families between which no intermarriage can take place, and that they resemble, in this respect also, the ancient Brahmanical Hindus, who established similar restrictions in their religious codes.

As regards the pantheon of the Jaina creed, it is still more fantastical than that of the Brahmanical sects, whence it is borrowed to a great extent,

but without any of the poetical and philosophical interest which joheres in the gods of the Vedic time. The highest rank amongst their numberless hosts of divine beings-divided by them into four classes. with various subdivisions—they assign to the deified saints, which they call Jina, or Arhat, or Tirthakara, besides a variety of other generic names. The J. enumerate twenty-four Tirthakaras of their past age, twenty-four of the present, and twenty-four of the age to come; and they invest these holy personages with thirty-six superhuman attributes of the most extravagant character. Notwithstandiog the sameness of these attributes, they distinguish the twenty-four Jinas of the present age from each other in colour, stature, and longevity. Two of them are red, two white, two blue, two black; the rest are of a golden hue, or a yellowish brown. The other two peculiarities are regulated by them with equal precision, and according to a system of decrement, from Rishabha, the first Jina, who was 500 poles in stature, and lived 8,400,000 great years, down to Mahávira, the 24th, who had degenerated to the size of a man, and was no more than 40 years on earth; the age of his predecessor, Pars'wanatha, not exceeding one hundred years. The present worship is almost restricted to the two last Tirthakaras; and as the stature and years of these personages have a reasonable possi-bility, H. T. Colebrooke inferred that they alone are to be considered as historical personages. As, moreover, amongst the disciples of Mahavira there is one, Indrabhati, who is called Gautama, and as Gautama is also a name of the founder of the Buddha faith, the same distinguished scholar concluded that, if the identity between these names could be assumed, it would lead to the further surmise that both these sects are branches of the same stock. But against this view, which would assign to the Jaina religion an antiquity even higher than 543 before Christ-the date which is commonly ascribed to the apotheosis of Gautama Buddhaseveral reasons are alleged by Professor Wilson. As to the real date, however, of the origin of the Jaina faith, as the same scholar justly observes, it is immersed in the same obscurity which invests all remote history amongst the Hindus. We can only infer from the existing Jaina literature, and from the doctrines it inculcates, that it came later into existence than the Buddhist sect.-The best essays on the tenets, mythology, observances, and literature of this sect are those by Colebrooke in his Miscellaneous Essays, and by Wilson in the first volume of his works (London, 1862).

JAKU'TSK (Yakootsk), chief town of the territory of that name in Eastern Siberia (see SIBERIA). It is situated on the left bank of the river Lena, It is situated on the left bank of the liver areas, lat 62° 1' N., long. 119° 44' E.; distance from St Petersburg, 5751 miles; pop. in 1858, 3460 inhabitants. The whole industry of the town consists in candle-works, but it is, notwithstanding, the principal market of Eastern Siberia for traffic with the native hunting tribes of the Jakuts and Buriats. The former, mostly nomadic tribes, possessing large herds of cattle and horses, bring butter to the market, which is despatched on horseback to the port of Okhotsk. The latter, also a nomadic tribe, bring to Jakutsk great quantities of fur-skins, of sables, foxes, martens, squirrels, bears, hares, &c. The most animated periods of the year are the months of May and June; in the former, the goods are despatched to the sca-ports; in the latter, an important fair takes place annually, during which the quantity of merchandise sold, chiefly furs and manufoth turks, amounts to £50,000 in value. Manufactured goods, hardware, &c., are brought from Irkutsk by the Lena, and hydragogue action.

the passage, about 2200 miles, requires a whole month of navigation

JA'LAP, a well-known purgative medicine, is the root of Exogonium Purga, a plant of the natural order Convolvulacea. It is found in Mexico, at an elevation of about 6000 feet above the level of the sea, in the neighbourhood of the town of Jalapa or Xalapa, from which the name jalap is derived.

It is a perennial twining plant, with large flowers and a turnip-like root, varying from the size of a

Jalap (Exogonium Purga): a, the root.

hazel-nut to that of a man's fist. The roots when fresh are white and fleshy, and abound in a milky juice. They are prepared for the market by drying. Juce. They are prepared for the market by dryng.

—Jalap was long erroneously referred to other
plants, amongst others to Mirabilis Jalapa, known
in our flower-gardens as Marvel of Peru.—The root known as Male Jolap or He Jalap, with which the true jalap of commerce is often adulterated, was recently declared by Mr Hartweg to be Ipomæa butatoides. Its properties are somewhat similar to those of true jalap, but it is very inferior. Jalap seems to have been first introduced into

this country as a medicine about 1609.

The dried roots are brown and wrinkled externally, and of a deep yellowish-gray colour internally; their odour is faint and disagrecable, and their taste is nauseous. The active ingredient is the resinous portion, which varies from about 10 to nearly 20 per cent., and which is composed of two distinct substances, Jalapine (C34H56O16) and Jalapic acid.
Jalap resin may be distinguished from common resin by its insolubility in volatile oils. Jalap is a valuable cathartic, but is seldom given alone. Its purgative action is increased by the addition of a little calomel, and its hydragogue action by bitartrate of potash, while its tendency to produce griping is obviated by the addition of a little ginger. It is extremely useful in those febrile affections of children which are associated with constination: and in diseases of the brain it is a good purgative to select, in consequence of its derivative action. In the form of Compound Jalap Powder, which consists of one part of powdered jalap, two parts of bitartrate of potash, and a little ginger, it is of great service in some kinds of dropsy, in consequence of its

The ordinary dose of powdered ialap for an adult varies from ten to thirty grains, a scruple generally acting smartly and safely; for children under a year old the dose is from two to five grains. The year off the dose is from two to her geams. Indose of the compound powder is double that of the ordinary powder. The *Tincture* of *Jalap*, in the dose of one or two drachms, is a useful addition to the ordinary black-draught when it is desired to increase its activity.

JALA'PA, a city in the Mexican confederation, is second in importance among the towns of the state of Vera Cruz. It is on the grand route between the capital of the country and the seaport of Vera Cruz, and is about 60 miles west-northwest from the latter. Situated at an elevation of 4335 feet above the level of the sea, its climate may be said to be that of the temperate region, and it is a favourite resort of the invalids of the coast. Pop. in 1865, 37,200.

JAMAI'CA, aboriginally Xaymaca, or Land. of Wood, and Water, one of the West India Islands. and by far the most important of those belonging to Great Britain, is about 90 miles to the south of Cuba, and stretches in N. lat. hetween 17 40' and 18° 30', and in W. long. between 76° 15' and 78° 25'. Area, 6400 square miles (rather more than that of Yorkshire); greatest length, 150 miles; greatest breadth, 50 miles. It is traversed from east to west by a heavily-timbered ridge, called the Blue Mountains, which rises to about 7000 feet. From this range, at least 70 streams descend to the north south shores, but owing to the shortness and declivity of their courses they are not navigable, with the exception of one, the Black River, which affords, for small craft, a passage into the interior for 30 miles. Excellent harbours are everywhere to be found. But incomparably the best of these is formed by a deep and capacious basin in the south-east quarter of the island, which washes the most spacious and fertile of the plains between the hill-country and the coast. Around this inlet, and within a few miles of each other, are all the considerable centres of population, Port Royal, Kingston, and Spanish Town. The soil and climate are so genial, that coffee-plantations are found at an altitude of 5000 feet above the sea-level.

The climate varies considerably—the torrid belt of the coast gradually passing into the temperate region of the central heights. The latter is said to be remarkably favourable to longevity; and, to be remarkably invourable to longevity; and, after having long been a retreat for the residents themselves, it has lately begun to attract invalids from the United States. To contrast two positions—the one near Kingston Harbour, and the other at the intermediate elevation of 4000 feet—their annual means are stated to be respectively 91° E, and 68° E. The rainour propagations of the contract of differ widely in different years, ranging from about 60 to upwards of 120 inches—the consecutive years of 1835 and 1836 having given 122-12 and 59-13. Hurricanes are understood to be both less frequent and less violent than in most other parts of the archipelago—a peculiarity ascribed, in some measure, to the shelter afforded by the larger islands of Hayti and Cuba. Earthquakes have occasionally occurred, one of them, in 1692, having almost overwhelmed Port Royal.

J. was discovered by Columbus during his second voyage in 1494, and was taken possession of by the Spaniards in 1509. So great was the inhumanity of the conquerors, that 50 years after the Spanish invasion of the island the native population is said to have entirely disappeared. On May 3, 1655, a British expedition, sent out by Oliver Cromwell,

captured the island, which was formally ceded to England by the treaty of Madrid in Ifa?o. During the 150 years of Spanish colonisation, the inhabitants, including Africans and Europeans, had not attained the number of 3000. Within about the same period of English rule (from 1655 to 1801), the estimated census shewed 340,000—30,000 whites, 10,000 free people of colour, and 300,000 slaves. In 1861, the total population amounted to 378,433, of whom 13,816 were whites. More recently the pop. was 441,255. But in J., as in the British colonies at large, the distinction between the two races is now merely physical. Even as early as 1830, freeholders of colour received the elective franchise: and, subsequently to 1838, they became themselves qualified to sit in the local legislature—a qualification which, by 1853, had placed one of them in the council, and fifteen in the assembly. On the productiveness and trade, however, of the island, emancipation has undeniably had an unfavourable effect. But, even previously to the new order of things, the commercial crops had been steadily decreasing. To take by itself the grand staple of sugar, the last 3 years of the slave-trade, 1805 – 1807, had averaged fully 144,000 hogsheads; the 4 years before the commencement of the abolition 4 years before the commencement of the abolition of slavery, 1831—1834, under 91,000; the 4 years of gradual abolition, 1835—1838, nearly 70,000; and the first 4 years of perfect freedom, 1839—1842, less than 42,000. According to the returns of 1834 and 1860, the principal exports—making allowance at the same time for a growing consumption on the spot-were as follow:

		1834.	1860.	1867.	
Sugar (cwts.),		1,500,000	599,737	515,962	
Rum (gallons), .		2,697,324	1,694,606	1,769,716	
Pimento (lbs.),		3,605,400	6,850,548	4,666,239	
Coffee (lhs.), .		17,725,731	6,145,362	6,264,861	

Among the other productions of the island are ginger, logwood, mahogany, cocoa-nuts, arrowroot, &c. Indigo, once widely cultivated, is now neglected. But while the exports have diminished, the imports, more particularly of food, have increased.

* C							
Rice (lbs.),	٠	1,730,680	265,082	1,850,240			
Butter and Lard (firkins),		13,717	17,997	***

		1534,	1830.	1000*			

In 1868 the imports from G. Britain amounted to £644,741, and the exports to £1,403,847, and the ton-nage of vessels to 236,009 British, and 92,660 foreign. In the same year the revenue amounted to £328,964, and the expenditure to £392,264.

Politically J. includes the Caymans to the north-west, while, to the north-east, the Turk's Islands, the most southerly portion, in fact, of the Bahamas, form a separate dependency. The constitution is somewhat peculiar. In addition to the royal governor and a popular assembly of 47 members, there is a council, partly legislative and partly executive, of 12 nominees of the crown. Both for constituents and representatives, there is a pecuniary qualification, of which, in either case, one phase is the payment of direct taxes—£10 a year qualifying for a representative, and £3 for a con-stituent. Ecclesiastically, sects and denominations abound. The Church of England, which here approaches more nearly to the condition of an establishment than is usual in colonies, has a bishop, whose diocese embraces British Honduras and the Bahamas, with a regular staff of parochial clergy; under Admirals Penn and Venables, assailed and and besides Presbyterians, Methodists, Baptists,

and other Protestant bodies, Roman Catholics are numerous, and Jews still more so.

After being 200 years in the possession of Britain, the capabilities of J. are still very inadequately developed, though it possesses almost virgin sources of wealth and plenty in its pastures and its fisheries. In 1865 a riot having occurred at Morant Bay, it was followed by the indiscriminates shanghter of the blacks engaged therein. The conduct of Governor Firm and the property of the conduct of Governor Firm and the property of the conduct of Governor Firm and the property of the conduct of Governor Firm and the property of the conduct of Governor Firm and the property of the conduct of Governor Firm and the conduct of the c

JAMBOS. See EUGENIA. JAMES (Gr. Jacobos, and really the same word as Jacob) is the name borne by two or three persons in the New Testament. These are James the son of Zebedge, and James the 'brother' or 'cousin' of our Lord, who is considered by many to be the same as James the son of Alpheus. James the son of Zebe-dee, surnamed the Elder, was the brother of the apostle John, and before his call to the apostleship was a fisherman. After the ascension of Christ, he seems to have remained at Jerusalem, and was the first of the apostles to suffer martyrdom, being slain by Herod in the year 44 A.D. There is an incredible legend of his having planted the gospel in Spain, tegent of the naving planted the general Aspata, and he is the patron saint of that country.—JAMES the 'brother' or 'cousin' of our Lord, surnamed the Less, the other apostle of this name, appears to have resided, like James the Elder, chiefly in Jerus:dem. From the glimpses of him which are obtained in the Acts of the Apostles and the Epistle to the Galatians, it is clear that he presided over the mother-church of Jerusalem. According to the tradition recorded by Hegesippus (who flourished about the middle of the 2d c.), he was considered a miracle of 'righteousness,' even by the unbelieving Jews, who gave him the name of the Just. The enmity of the more bigoted Jews, however, procured his condemnation, and the high-priest Ananus gave order that, he should be stoned to death. According to Josephus, the execution of the sentence excited great dissatisfaction among the people of Jerusalem. The date of his death cannot be precisely fixed, but it was probably about 62 or 63 A. D. THE EPISTLE GENERAL OF JAMES is regarded by most theologians as a composition of his. The primitive church, however, placed it sometimes among the antilegomena (or scriptures of doubtful genuineness), and sometimes even among the notha (or spurious scriptures). In the 4th c., its authority increased; and the Council of Carthage (397 A.D.) pronounced it 'canonical.' This, of course, did not settle the question of its authenticity; and at the period of the Reformation, both its authenticity and religious teaching were attacked by Erasmus and Cajetan (in the Roman Catholic Church), by Lucar (in the Greek Church), and by Luther, who called it 'a downright strawy epistle,' the work of some unknown James, who misunderstood the doctrines of the Apostle Paul. Modern divines, generally, profess to see no discrepancy between the teaching of the two apostles, and imagine that they are looking at the same great verity from different but not contradictory stand-points (see JUSTIFICATION). The style is clear, polished, and poetical, very little disfigured with Hebraisms, and indicating that its possessor was a man of superior culture. Compare Alford's Greek Test. vol. 4 (Lond.

JAMES 1., king of Scotland (1406-1437), was the second son of Robert III., by Annabella Drum-

mond, daughter of Sir John Drummond of Stobhall, His elder brother, the Duke of Rothesay, having been murdered by his uncle, the Duke of Albany, J. became heir to the throne. Fearing that he also might be sacrificed to the unscrupulous ambition of Albany, his father resolved to send him to France, Accordingly, in 1405, he set sail for that country, but he never reached it; the vessel in which he was embarked having been taken by the English. J. himself was carried to London, and sent to the Tower. In 1407, he was removed to Nottingham Castle. In 1417, he accompanied Henry V. in his Castle expedition to France. On the death of Robert III. in 1406, the government devolved on the Duke of Albany. On his death, in 1419, his son Murdoch succeeded to the regency. In 1424, J.'s long captivity came to an end; on giving hostages for payment of £40,000, he was allowed to return to his kingdom. Previous to leaving England, he married Joanna, daughter of the Earl of Somerset, fourth son of John of Gaunt. To the excellent education which he had received in England, J. was indebted for the development of his very considerable powers of mind. His poems, Christ's Kirk on the Green (the authorship of which, however, is disputed), and King's Quhair, shew him to have been possessed of high poetic talent. With the acts of his first parliament, in 1424, the regular series of Scotch statutes may be said to begin. Many excel-lent laws were passed for the regulation of trade, and for the internal economy of the kingdom; while these were followed up by an executive vigour which Scotland had never known before. No sooner did J. feel himself firmly seated on the throne, than he resolved to execute vengeance on the Albany family. By a parliament held at Perth in 1425, the two sons of the late Regent Murdoch, and his father-in-law, the Earl of Lennox, were found guilty of certain crimes laid to their charge, and immediately beheaded. The next few years of J.'s reign are among the most really peaceful in the history of Scotland previous to the union of the crowns; the whole efforts of the king being directed to the repression of the internal disorders of the kingdom; especially of the Highlands, where scarcely any law except that of the strongest had hitherto been known. In 1436, J.'s eldest daughter, Margaret, was married to the Dauphin of France, afterwards Louis XI. Amongst those whom the wisely severe policy of the king had offended was Sir Robert Graham, uncle of the Earl of Strathearn. He had been imprisoned in 1425, on the impeachment of the Albany family. Owing to this cause, or to some real or imaginary injury done to his family, Graham was so irritated, that in 1435 he actually used treasonable language to the king himself when presiding in parliament. For this he was banished, and his possessions declared forfeited. He retired to the Highlands, to brood over a plan of revenge, which circumstances soon put it into his power to execute. In 1437, the court held the Christmas festival at Perth. The king was about to retire for the night, when the sound of men in armour was heard outside the gates. It was Graham, accompanied by 300 armed men. The locks of the chamber-door having been purposely spoiled, Catherine Douglas, with a spirit worthy of her name, thrust her arm into the staple, to make it serve the purpose of a bar; but her arm was broken, and the ruffians entered the chamber. The king, who had hidden himself in an aperture under the floor, was discovered, dragged out, and cruelly murdered, in the 44th year of his age. Graham and the other ringleaders were afterwards seized, tortured, and put to death. J. was unquestionably the most able of the Stuart family. Both

JAMES II., king of Scotland (1437-1460), was the son of James I. and Queen Joanna, and was born in 1430. He was crowned at Edinburgh when only in the sixth year of his age. Sir William Crichton, the Chancellor, and Sir Alexander Livingthe young king, and consequently to wield the royal authority until he had reached his fourteenth year. The power of the House of Douglas had now risen to so great a height as almost to overshadow that to so great a neight as almost to overshadow that of the crown. In the hope of curbing it, Crichton had treacherously caused William, the young earl, and his brother to be put to death. The policy of the act proved to be as had as its spirit, for by the marriage of the heiress of the murdered youth with her cousin, the family was restored youth what has its former power. The young king, tired of the rule of Crichton, put himself under the control of Douglas. A parliament was held, by which Crichton and Livingston were declared rebels, and their estates forieited. Under the rule of the earl, the kingdom fell into complete anarchy, and became one scene of violence and disorder. Douglas, became one seene of violence and disorder. Douglas, however, maintained the warlike renown of his House; in 1448, the English having invaded Scotland, he gave them battle on the banks of the little river Sark, in Annandale, and defeated them with very considerable slaughter. In 1449, J. married Mary, daughter of Arnold, Duke of Gelderland. The character of the king appears to have been much strengthened after ha marriage. Like most of the Stuarts, he possessed great animal courage; he seems also to have possessed much of his father's clearness of perception in framing laws, and of his energy in enforcing their observation. Chafing under the sway of Douglas, he resolved to Chaining under the sway of Douglas, he resolved to assert his independence. Criciton, who had pre-viously contrived to make terms for himself, was constituted the royal adviser. Douglas, driven from power, formed an alliance with the Earl of Crawford. By the union of these two powerful nobles, it seemed that the royal authority in Scot-land had virtually become extinct. J. had recounts to treachery; he invited Douglas to visit him at Stribing Carlas where sciences. Stirling Castle, where, picking a quarrel with him, String Castle, where, picking a quarrel with him, the murdered the earl with his own hand. But the power of the Douglas family was not yet broken. Through the aid of the House of York, then dominant in England, and by the marrial influence of his name, the heir of the murdered call was on his name, the first of the indirected eart was enabled to raise the standard of rebellion at the head of an army of 40,000 men. But J., listening to the wise advice of his conneillor Kennedy, soon succeeded in quelling this insurrection. Donglas succeeded in quelling this insurrection. Dongras was compelled to flee; and his lands were granted to the Earl of Angus. In 1460, from causes not clearly known, J. infringed an existing trace with England, by laying siege to the castle of Roxburgh, then in the hands of the English. While he was standing beside one of the rudely made ne was samuing beside one of the futtery made cannons of that time, the gun burst, and a fragment striking him, produced almost immediate death. He died in the 29th year of his age, and 24th of his reign.

JAMES III., king of Scotland (1460-1488), was the son of James II. and Mary of Gelderland, and was born in 1453. On the death of his father, was born in 1905. On the death of his maker, the government appears to have been conducted by his mother, guided by the wisdom of Bishop Kennedy. On the death of the latter in 1465, the wants him fall just the brake of 14

his intellectual and practical ability were of a very to Sir Thomas Boyd, son of Lord Robert, Sir Thomas being at the same time created Earl Thomas being at the same time created Lari of Arran. On the king's marriage, however, in 1469, with Margaret of Denmark, power changed hands: Lord Boyd was obliged to flee, and even Arran was driven into exile; in which condition he died. In 1474, his widow married Lord Hamilton : of which marriage were born James, created Earl of Arran in 1503, and Elizabeth, who married Matthew, Earl of Lennox. J. was all his life under the influence of favourites. Conspicuous among these was a man named Cochran, originally a mason. Through his means, the Duke of Albany, brother of J., was forced to flee from the kingdom, having heen charged with witchcraft; while the Earl of Mar, also a brother of the king's, was actually put to death on the same absurd accusation. The rule of Cochran and other low-horn favourites became intolerable to the haughty Scotch nobility. Disputes having arisen with England, and an Eng-Disputes having arises with England, and an Eng-hsh force having advanced on Berwick, J. put him-self at the head of an army to oppose the invadera, Angus, Crawford, Argyle, and others recoved to profit by this opportunity to rid themselves of the obmoxims favourite. They met in considerate deliberate upon their plans. It was on this occa-sion that Angus acquired his well-known sobringue of 'Bell the Cat,' The result was, that Coelrans and five others of the Laving Cat. of Bell the Cat. The result was, that contrast and five other of the leading favourites were sized and summarily hanged. The king himself was imprisoned within the castle of Edinburgh. The banished Duke of Albany had joined the English army. On a treaty being made, he was, by some unknown means, restored to his brother's favour. He did means, restored to his prother's tayour. He did not long hold it, however. In 1487, Margaret of Denmark died. J.'s love of pursuits which, for the age in which he lived, were intellectual, brought upon him the contempt of a warhke and illiterate nobility—a contempt on which the weakness of his moral character imposed no check. A conspiracy, whose origin is obscure, ended in a rebellion, having for its avowed object the dethronement of the king. Many of the peers, however, remained loyal, so that J. was enabled to put himself at the head of a considerable force. But, manly through the cowardice of the king, the royal army was deteated at Sauchie, 18th June 1488. J. escaped from the field; but he was afterwards discovered by one of the rebels, and murdered. He died at the age

JAMES IV., king of Scotland (1488-1513), was JAMES IV, sing it scottand (1952-1915) was the son of James III. and Margaret of Denmark, and was born March 17, 1472. A movement, headed by the Earl of Lennox, having for its object the subversion of the new government, was soon quelled; and the rule of the young king was soon quened; and the vale of the young king gave promise of being hoth vigorous and popular. The avarice of the preceding reign was followed by a profusion which conciliated the nobles; while the a profusion which concludes the books, while the king's personal beauty and open manner won the hearts of the people. The haval exploits of Sir Andrew Wood of I Largo, in the beginning of this reign, are worthy of note. With a greatly inferior force, he twice defeated the English; on one occasion, capturing as many as five of their ships of war. Instead of avenging this defeat by force of arms, Henry VII., then reigning in England, wisely resolved to endeavour to win Scotland by conciliation and policy. He proposed a marriage between J. and his daughter Margaret; but his wise schemes 3. and the transfers of all and the water for a long time frustrated by the gold and intrigue of the king of France. But at length the prudence of Henry prevalled, and in 1503, J. married Margaret of England. By a treaty then entered into Menney. On the death of the latter in 1465, brindence of Henry prevailed, and in 1503, J. married the young king fell into the hands of Lord Boyd dargaret of England. By a treaty then entered into and his family. In 1467, so great influence had between England and Scotland, the first peace since they acquired, that J. gave his sister in marriage | 1332 was established between the two countries

The king of England saw what none of his predecessors had been able to see-that he could easily gain by policy what it was hopeless to attempt to seize by force. Had he lived longer, a lasting amity might have been established between the two countries; but his son and successor was even bottomthes; make its on an successor was even hotter and more headstrong than J. himself. The English treaty was followed by a period of almost unexampled peace and prosperity; but by the death of Henry VII., in 1509, all this fair prospect was destroyed. It was not, however, until Henry VIII. had been two years on the throne that a rupture took place between the two kings. J. had demanded reparation for an alleged outrage on the Scottish flag; Henry had returned a contemptuous answer. He had further irritated the Scotch king by countenancing certain English border chieftains who had been accessory to the murder of Sir Robert Ker; he had also declined to deliver a legacy of jewels bequeathed to Queen Margaret by her father. and augry negotiations followed, which ended in James's rash and fatal invasion of England in the summer of 1513. The disastrous battle of Flodden (q. v.) was fought on the 9th September of that year. The body of James was found on the field after the battle. He died in the 41st year of his age, and 26th of his reign.

JAMES V., king of Scotland (1513—1542), was the son of James IV. and Margaret of England. He was born at Linlithgow, 10th April 1512. The period of his long minority is one of the cloomiest in Scottish history. Such was the law-less state of the country, that it was impossible to pass from one place to another except in armed companies. The Duke of Albany was chosen regent by the parliament, but his government was almost powerless, owing chiefly to the jealousy and enmity of the Earl of Angus, who had married the queenmother. Ultimately, Angus prevailed, and the duke retired to France. For a while, the Angus branch of the Douglas family ruled Scotland in the same manner as the elder branch had ruled it in the beginning of the reign of James II. When in his seventeenth year, the king, resolved no longer to brook the anthority of the earl, escaped from his custody. Angus and his family were banished, and their estates declared forfeited. In 1536, J. visited the court of France; and on the 1st January 1537, he was married to Magdalen, daughter of Francis L. This amiable queen lived for but a few weeks; and in the same year, J. was again married. His second wife was Mary of Lorraine, daughter of the Duke of Guise. Henry VIII. having declared his independence of the pope, became desirous that his nephew should follow his example; but J. remained true to his ancestral faith. The king had two sons by Mary of Guise, but they both died in infancy, within a few days of each other-an event which seems to have greatly affected the mind of James. With the view of gaining his nephew over to his ecclesiastical views, Henry proposed that they should have an interview at York. He actually went to that city, and remained in it for six days, expecting the arrival of J., who never eame. This piece of real or fancied neglect greatly enraged Henry. In 1542, the English having made an incursion across the border, were attacked and defeated with great loss by the Earls of Huntly and Home. To avenge this defeat, Henry sent the Duke of Norfolk into Scotland with an army of 20,000 men.

Negotiations for peace having failed, J. raised an army of 30,000 men to oppose Norfolk. The spread of the Reformation had now begun to divide the kingdom; the nobles being mostly on the reformed side, while the king sided with the clergy. When

Norfolk's retreat. The nobles, actuated either by Norfolk's retreat. The nobles, actuated either by disloyalty, or by thoughts of Flodden, declined to follow the king in an invasion of England, upon which he was bent. While this controversy was pending between J. and the nobles, a report arose that Oliver Sinclair, a royal favourite, had been appointed to the chief command. The army became a scene of tumult and disorder. While in this disorganised state, it was attacked by Daere and Musgrave, two English leaders, at the head of 300 men, The Scotch were utterly routed. This dishonour to his arms seems quite to have broken the heart of his arms seems quite to have moken the heart of James. He shut himself up in Falkland Palace, where he died, December 13, 1342, seven days after the birth of his unfortunate daughter Mary, in the 31st year of his age, and 30th of his reign.

JAMES I. OF ENGLAND AND VI. OF SCOTLAND JAMES 1: OF ENGLAND AND VI. OF SCOTLAND (1567 [England 1603]—1625), only son of Mary, Queen of Scots, and Henry Lord Darnley, was born within the castle of Edinburgh, 19th June 1566. On his mother's forced resignation of the crown, J. was proclaimed king of Scotland, 29th July 1567. The direction of his childhood devolved principally on the Earl of Mar. His classical education be received from the famous George Buchanan. In 1578, the Earl of Morton, then regent, was driven from power, and J. nominally assumed the direction of affairs. But the new government was unpopular, and Morton soon succeeded in re-establishing himself. His fall was, however, ultimately effected by the united influence of the Duke of Lennox and of the Earl of Arran. Morton was condemned and executed on the charge of having been accessory to the murder of Darnley. After his death, Lennox and Arran ruled for some time without control. On the 12th of August 1582, however, a party of the nobles seized the king at Ruthven Castle; and by authority thus acquired, they imprisoned Arran, and banished Lennox. In 1583, a counterplot restored J. to freedom; he immediately restored Arran to power. The confederate lords were obliged to flee to England. In 1585, through the connivance of Queen Elizabeth, they returned, and with an army of 10,000 men, obliged J. to capitulate in Stirling Castle. Arran was again banished. In 1586, Queen Mary, then a prisoner in England, was condemned by the English court to be executed. condemned by the English court to be executive.

Though J. remonstrated strongly, he nevertheless, after his mother's execution, concluded an offensive and defensive alliance with England. In the winter of 1589, J. went to Denmark, where he married the Princess Anne, daughter of Frederick II., king of that country. From 1591 to 1594, the kingdom was disturbed by various treasonable attempts by the Earls of Bothwell, Huntly, and other Roman Catholic lords. It was not till J. had marched against Huntly in person that these disturbances were suppressed. ecclesiastical disputes followed between king and ecclesiastical disputes followed between King and clergy. In 1600, occurred the Gowrie Conspiracy (q. v.). By the death of Elizabeth in 1603, J. succeeded to the throne of England. He soon became unpopular with his new subjects. The anger of the Roman Catholics at the severities used towards them was the cause of the fanous Gun-powder Plot (q. v.). The treason was discovered on the 5th of November 1603. Nor did time increase the popularity of J. with any class of his subjects. Weak and good-natured, he impoverished his exchequer to enrich parasites; he degraded the prerogative of the crown by the sale of titles of dignity; the title of baronet, which he originated, could be bought for £1000, a barony for £5000, and an earldom for £20,000. A Scotchman of the name of Carr became the royal favourite about the year the Scottish army had reached Fala, news arrived of 1607; honours and emoluments were showered

upon him, and in 1613 he was created Earl of Someract. In his turn, Someract gave place to Buckingham. Under these minions, the name and power of England, so formidable under Einabeth, sunk to insignificance. In 1617, J. revisited Scotland; a visit which his angry disputes with the clergy did not give him much leisure to enjoy. In 1618, his cletes son, Henry, Prince of was also should be considered to the clergy did not give him much leisure to enjoy. In 1618, his clete son, Henry, Prince of was also should be considered to the clergy did not give him and the should be considered to the court of Spain, along with Buckingham, to roscente his suit. Buckingham, bowere, having quarrelled with the leasting mon of the Spanish court, the orgotisticio ultimately falled though on 27th March 1625. He was aptly termed by Sully 'the wisest fool in Christendom.' He was indeed,' says Macaulay, 'made up of two mem—a witty, well-read scholar, who worte, dispotad, and harangued, and a nervous, drivelling iduot who acted.' His reign is interesting to the student of English constitutional history, as it was during it that parlament may be said to have taken it lies. The parlament of 1621 is especially memorable on this account.

JAMES II. OF ENGLAND AND VII. OF SCOTLAND (1685-1688), son of Charles I. and Henrietta Maria, was born 15th October 1633. In 1643, he was created Duke of York. In 1648, during the civil war, he made his escape to France. For some time he served in the French army under Turenne; but on peace being made with Cromwell, he was obliged to leave both the army and territory of Louis XIV. He then entered into the military service of Spain. At the Restoration, he was made Lord High Admiral of England, twice commanding the English fleet in the ensuing wars with the Dutch. 1660, he married Anne, daughter of Lord Chancellor Hyde. On the death of the Duchess of York in 1671, Ayue, on the death of the Fuchess of York in 1671, J. avowed fits conversion to popery. On the passing of the Test Act in 1673, he was obliged to resign office. On the 21st November 1673, he married Mary Beatrice, daughter of the Duke of Modena. During the great irritation against the Roman Catholics which arose in England on the publication of Titus Oates's supposed discoveries, the Duke of York resided for a short while on the continent. The bill for his exclusion from the throne was twice read before the House of Commons, and only prevented from passing by the prorogation of par-liament, 26th May 1679. In 1680, the Exclusion Bill passed in the House of Commons, but was rejected in the House of Lords. On his return from abroad, and while the Exclusion Bill was before parliament, the duke was sent down to govern Scotland. On the death of Charles II., 6th February 1685, J. succeeded to the crown without opposition. He had scarcely been many hours a king when he violated the fundamental laws of the constitution by continuing the levy of customs, settled on the late king for life only, without the authority of parliament. At war with his parliament, in order to obtain money, J. was forced to become the pen-sioner of Louis XIV. In Passion Week 1685, the rites of the Church of Rome were openly celebrated

of parliament on the 9th November of this year. J. requested extra supplies to maintain a standing army, which was a favourite scheme of his. He noticed in his speech, that in some recent appoint-ments he had thought fit to dispense with the Test Act. After a stormy debate, government was finally beaten on the question of supply. To aid his endeavours in favour of the Roman Catholics, J. resolved to try to conciliate the Puritans, much as he hated them. On the 4th of April 1687, appeared the memorable Declaration of Indulgence, in which the memorable Declaration of inoutgence, in which he announced his intention of protecting dissenters in the free exercise of their religion; and the nation beheld the extraordinary spectacle of the House of Stuart leagued with republican and regicide seets against the old Cavaliers of England. The attempt to conciliate the Puritans was, however, unsuccessful; and in March 1687, it began to be evident that the war between king and church must soon reach a climax. At that time, a vacancy having occurred in the presidency of Magdalen College, Oxford, a royal letter came down recommending Anthony Farmer, a Roman Catholic, to the vacant place. For Farmer was afterwards substituted Parker, Bishop of Oxford. He was known to be a Roman Catholic, though not avowed; besides which, he laboured under other legal disqualifications. The Fellows of the college declined to elect him. A special ecclesiastical commission was then sent to Oxford, escorted by three troops of cavalry with drawn swords. Parker was installed, the Fellows expelled, and declared for ever incapable of holding any church preferment. On the 27th April 1688, J. published a second Declaration of Indulgence; this he ordered to be read in all the churches in the kingdom. The order was generally disobeyed by the clergy, and seven of the bishops having ventured on a written remonstrance, were committed to the Tower on a charge of seditious libel. On the 10th June of the same year, J.'s luckless son, known in history as The Pretender, was born. The history of the trial and acquittal of the seven bishops on the 29th June 1685, forms one of the most glowing passages in the splendid narrative of Macaulay. On the night of the same day, an invitation was despatched to William, Prince of Orange, signed by seven of the leading English politicians, to coroe over to England and occupy the throne. On the 5th of November, William landed at Torbay with 14,000 men. J. found himself deserted by the nobility, gentry, and army; even his own children turned against him. He retired to France, where he was agains nim. He reurea to France, where he was hospitably received by Louis XIV., who settled a revenue upon him. Early in March in the follow-ing year, he made a hopeless attempt to regain his throne by invading Ireland with a small army, with which he had been furnished by the king of France; he was totally defeated at the battle of the Boyne, 1st July 1690. He returned to France, continuing to reside at St Germain's till his death, 6th September 1701. There is hardly a sovereign mentioned in history of whom one can find less good to say than of James II. JAMES, GEORGE PAYNE RAINSFORD, a fecund

tion by continuing the levy of customs, settled on the late king for life only, without the authority of and popular novelst, was bern in Londian in 1804, parliament. At war with his parliament, in order to obtain money, J. was forced to become the pensioner of Louis XIV. In Passion Week 1655, the pensioner of Louis XIV. In Passion Week 1655, the wrote seven eastern tales, entitled The String of rites of the Church of Rome were openly celebrated places, but the first work that how the authority at Westminster with full sphendour. In the same year, the suppression of the Duke of Monnouth's this priod till his death, which happened in 1825. From year, the suppression of the Duke of Monnouth's inpriod till his death, which happened with rebellion in England, and that of the Earl of June, 1800, in Venice, where he held (since 1835) Argyle in Scotland, was followed by great severities, the (file of British cosnal, his pallicutions were, On the western circuit alone, well known as the Bloody Assige, presided over by the inflamous — Baraley, Be L'Orne, Philip Augustus, Heruy Jeffreys, 320 persons were hanged. On the meeting Masterton, and Mary of Baryundy. He also composed fits

some poetry, and several historical works of a biographical kind, such as Charlemagne, The Black Prince, and Richard Cour de Lion. J.'s writings are cheerful and pleasant in spirit, but his notions of the romantic, whether in scenery or character, are entirely conventional, and are apt to make quick-witted readers smile at the invenility of the author's fancy.

JAMES, JOHN ANGELL, an eminent Congregationalist minister, was born at Blandford, Dersetshire, June 6, 1785, studied for a short time at a dissenting college at Gosport, and was placed on the 'preaching list at seventeen.' He was highly popular, and when only twenty, was settled as paster of the 'church meeting in Carr's Lane,' Birmiugham, where he remained till his death, 1st October 1859. In the course of years, Angell James came to be considered the most important and influential public man in connection with his own denomination, and on account of his 'evangelical' views of religion, he was also much esteemed both by the Low-Church party in the English Establishment, and by dissenters generally in Scotland and America. He published a multitude of sermons, tracts, addresses, and small religious volumes (the best known being the Anxious Inquirer), which had-and some of them still have -a vast circulation.—See Dale's Life and Letters of John Angell James (Lond. 1862).

JAMES RIVER, an important river of North America, fermed by the union of the Jackson and Cowpasture streams, rises near the middle of Virginia, and has its entire course in that state, It flows in an east-south-east direction, passing Lynchburgh and Richmond; and widening into an estuary for the last 60 miles of its course, it falls into the Atlantic at the southern extremity of Chesapeake Bay. It is 450 miles in length, and is navigable to Richmond, 150 miles from its mouth, Its chief tributaries are the Appenantox on the right, and the Chiekahominy on the left bank, made historical by the battles of 1862. It was at Jamestown, 32 miles from the mouth of this river, that the first English settlement in America was formed, 1607. By the James River and Kanawha Canal, which extends westward along the upper course of the river, from Richmond to beyond the Blue Ridge, the navigation of the James is carried into the centre of Virginia.

JAMES TOWN, the chief place and only seaport of St Helena (q. v.).

JA'MESTOWN, a village in New York, United States of America, 58 miles south-west of Buffalo, on Chautanqua Lake, and near Lake Erie. It has a large trade and considerable manufactures. Pop. in

JAMES'S BAY, a sontherly arm of Hudson's Bay, extends in lat. from 51° to 55° N., and in long, from 79 to 82° 30' W. It is so beset with islands that its navigation is more dangerous than that of the other divisions of the same inland sea. Near its southern extremity is situated Moose Factory, the most important station, next to York Factory, of the Hudson's Bay Company on the coast.

JAMES'S PALACE, St., a large inelegant brick structure, fronting towards Pall Mail, succeeded Whitehall as the London residence of the British sovereigns, and remained as such from William III. to Victoria. It was reconstructed and made a manor by Henry VIII., having before been a hospital dedicated to St. James; Henry also annexed to it a park, which he enclosed with a brick wall, to connect St. James's with Whitehall, the then royal residence. Additions and improvements gradually

made, totally changed the original palace, so that at the present time little, if any, of the old structure remains. In 1837, the royal household was transferred to Buckingham Palace, and St James's 18 now used only for levees and drawing-rooms, -The Court of St James's is the usual designation of the British Court.

ST JAMES'S PARK lies southward from the palace, and extends over 87 acres. Within the last thirty years, it has been greatly improved, and is now richly embellished with avenues of trees, and a fine piece of water in the centre, which is stocked with waterfowl. On the east side is the Parade, where the body-guards on duty are mustered, and where the regimental bands perform in fine weather. On the whole, this park is one of the greatest ornaments of London. On the outskirts are situated the Buckingham and St James's Palaces, Stafford House, Marlberough House, &c.

JAMES'S POWDER is a patent medicine discovered by a Dr Rebert James, who was admitted as a licentiate of the College of Physicians in 1765, and died in 1776, aged 73. The fame that he might otherwise have acquired-for he was a man of considerable professional skill, and a voluminous medical writer-was tarnished by his patenting his 'fever powders,' and still mere by his falsifying the specification to such an extent as to render it impossible te prepare the powder from his directions. Hence the Compound Powder of Antimony has been substituted fer it in the British pharmacopæias. From the analysis of the patent medicine, for which one or two London chemists assert that they have the true original prescription, it appears to consist of more than 50 per cent. of triphosphate of lime, which must be altogether inert as an anti-febrile medicine; of from 35 to 45 per cent. of antimonious acid, and a little antimonite of lime and teroxide of antimony. The pharmacopæial preparation very closely resembles it. Both James's Powder (prescribed under the title of *Pulvus Jacobi* veri) and antimonial powder are very uncertain in their operation, at one time pessessing considerable activity, and at another being almost inert. Either may be prescribed in doses of about five grains, as a suderific in fevers and rhenmatic affections, and may be given alone, or in combination with a few grains of calomel.

JAMESON, Rev. John, D.D., a meritorious Scotch scholar, was born in Glasgow, March 3, 1759, studied for the ministry, and in 1781 was ordained pastor of a congregation at Forfar, in connection with the Original Secession body. 1797, he was translated to Ediuburgh, where he died July 12, 1838. J.'s reputation as a man of letters rests on his Etymological Dictionary of the Scottish Language (1808-1809), of which he pubhished an abridgment in 1818, and to which he added a supplement in 1825. It is a work of great industry, and very considerable value as a collection of Scotch words, phrases, customs, &c.; but it possesses little critical merit, according to the out it possesses attree critical ment, according to the present standard. Among J.'s other performances may be mentioned, An Historical Account of the Ancient Cubders of Iona (1811); Hermes Scythicus, or the Rudical Affinities of the Greek and Latin Languages to the Gothic (1814); An Historical Account at the Royal Palaces of Scotland; an edition of Barbour's poem The Bruce (1820); and Blind Harry's Sir William Wallace. He also wrote several works of a professional nature, which do not call for special mention.

JAMESON, ROBERT, distinguished as a naturalist, was born at Leith, July 11, 1774, and died in Edinburgh, April 28, 1854. Although originally intended

for the medical profession, J.'s strongly manifested of Thoughts, Memories, Fancies (1854); and The love for the study of animals and plants early Scriptural and Legendary History of our Lord, &c., love for the study of animals and plants early led him to devote himself to various branches of led him to devote himself to various drancing on natural history. After having given evidence of considerable ability and indefatigable industry in various able memoirs, he went in 1800 to Freyberg, to study under Werner. He was elected in 1804 to the chair of Natural History in the university of the chair of Natural History in the university of Edinburgh; and during the term of his professor-ship, numbered among his students many of the best naturalists of the present day. In 1808, he founded the Wernerian Society of Edinburgh; and in 1809, brought out his Elements of Geognosy, in which he gave a comprehensive exposition of the Neptunian theory as it had been motified by Werner. In 1819, he founded, in concert with Sir David Revester, the Edinburgh Rulesophical Journal, and in 1826 the Edinburgh New Philo-counders, Journal of which he continued to be sophical Journal, of which he continued to be the editor till his death. His principal works, in addition to those we have already mentioned, are addition to those we have already mentioned, are A System of Mineralogy (1804); A Mineralogical Description of the County of Dumbarton (1805), which was intended to have been the first of a series of similar works on all the counties of Soctiand; Manual of Minerols and Mountain Rocks, &c. (1821); and Elements of Minerology (1837). The Natural History Museum of the uni-versity of Elinburgh is largely indebted to the care and skill of J. for its present improved condition, for, besides having carefully arranged its collections, which had been almost created by his own and other liberal donations, he obtained, by his representations to government, an annual grant for its maintenance. He was a fellow of almost all the learned societies of Europe.

JAMESON, or JAMESONE, GEORGE, an eminent Scotch portrait-painter, called by Walpole the Van Duck of Scotland, was born at Aberdeen in 1586. Of his early history, nothing is known. He was at Antwerp in 1616, studying under Rubens, had Van Dyck as a fellow-pupil, and returned to Scotland in 1628. He was first patronised by Sir Colin Campbell of Glenorchy, for whom he painted many Campoeu or Gienorchy, for whom he painted many portraits of the kings and queens of Scotland; among others, 'Robert Bruse' and 'David Bruse' His great talents being at once acknowledged, he was largely patronised by the nobility, and in 1633 Charles I, sat to him. He died at Elizhurgh in 1644. Though the pupil of Rubens and associate of Van Duek his propulations have and associate of Van Dyck, his productions bear very little resemblance to those of either of these great masters; distinguished for their clearness of outline, delicacy and softness of shading, and of outline, deficacy and softness of shading, and beauty of colour, they have neither the richness of the former nor the vigour of the latter. Though celebrated only as a portrait-painter, he has left numerous historical, miniature, and landscape pieces. His productions are very numerous; the largest collection of them is in the possession of the Earl of Breadalbane; and many others of the Scotch nobility possess paintings by him; there are also several in the halls of the university of Aberdeen.

JAMESON, MES ANNA, an English authoress, born in Dublin, May 19, 1797. She was the daughter of Mr Murphy, a painter, and was married in 1827 to a Mr Jameson, a barrister, but soon after separated from her husband, and devoted herself to literature. She died 17th March 1860. Her principal works are Diarry of on Enwayse (1826); Lowes of the Poets (1829); Characteristics of Charles and Charles (1826). Magnet 1829 of the Revision (1829). Shakspeare's Women (1832); Memoirs of the Early Italian Painters, &c. (1845); Sacred and Legendary Art (1848); Legends of the Monastic Orders (1850);

as represented in Christian Art (1860).

In all her writings, Mrs J. evinces a fine fancy, a delicate, womanly perception of the beautiful, and a genuine poetic enthusiasm. She is regarded as one of the first art-critics England has produced,

JA'MROSADE. See EUGENIA.

JAMU', a town and fort in the north of the Punjab, is in lat. 32° 44' N., and long. 74° 54' E. It stands, amid the more southerly mountains of the Himalaya, on both banks of an affluent of the Chenab, the town on the right side, and the fort on the left. It contains 8000 inhabitants.

JA'NESVILLE, a city in Wisconsin, United States of America, on both sides of Rock River, 45 miles south-south-east of Madison. It is built 45 miles south-south-east of Madison. It is unit partly on a plain by the river, and partly on a bluff 100 feet above it, where the public buildings are seen to great advantage. It is connected with Chicago, Milwankee, and the towns on the Mis-sissippi by intersecting railways. There is a large water-power for many mills and factories, and a state asylum for the blund. Founded in 1836, it had, in 1860, a pop. of 7703.

JANIN, JULES GABRIEL, a very clever French critic, was born at St Etienne, in the department of Loire, December 11, 1804, studied at the college Louis-le-Grand in Paris, and addicted himself to journalism at an early period. His wonderful piquancy of style, his airy grace of sentiment and wit, and his dashing paradoxes of criticism, have been greatly relished by his countrymen; so much so, indeed, that J., without fear of ridicule, has been able to dub himself le Prince de la Critique. For many years he made and destroyed literary reputations in the columns of the Journal des Débats. He has also written a good many novels, tales, He has also written a good many novels, tales, narratives of tours, &c., among which may be mentioned L'Ane mort et la jeune Femme guilloine, Contes finatasiques, Contes nouvezare, Yogoge de Victor Ogier en Orient, Les Catacombs, La Nor-mandie historique, pitteregue et menumente, La Bretagne historique, &c., Voyage de Paris à la Mer, and Les Signahonies de Hiros.

JA'NINA, a city of Turkey, capital of the evalet of Janina (the ancient Epirus), is situated on the southwestern bank of a lake of the same name, 40 miles inland from the shore opposite the island of Corfu.

The lake of Janina, called by the ancients Pambotis, consists of two portions connected by two channels. Its extreme length is about 12 miles, its greatest breadth about 3 miles. At its southern end, stood the ancient city of Dodona. The city of J. stands in the midst of an extensive and fertile plain, which produces fruits and grain in abundance. Its chief buildings are 19 mosques, 6 Greek churches, a Greek college, and two synagogues. Gold brocade is here extensively manufactured by Greek workmen, as well as gold lace for the east, morocco leather, silk goods, and coloured linen. J. was long the head-quarters of the gifted but unscrupulous Ali Pasha (q. v.). It is now in part deserted; its population, which was 40,000 under Ali Pasha, is now 25,000. Little is known of its early history.

JA'NIZARIES (*Jeni-tsheri*, new soldiers), a Turkish military force, originally formed by the Osmanli sultan Orkhan, about 1330, of young Christian prisoners compelled to embrace Mohammedanism; and more perfectly organised by Sultan Amurath I., after 1362, when the number was raised to about 10,000, and especial privileges were conferred on them. They were for some Legends of the Madonna (1852); Commonplace Book time recruited from Christian prisoners; but their

privileges soon induced many young Turks to seek admission into their body. There were two classes of J., one regularly organised, dwelling in barracks in Constantinople and a few other towns, and whose number at one time amounted to 60,000, but was afterwards reduced to 25,000; and the other composed of irregular troops, called Jamaks, scattered throughout all the towns of the empire, and amounting in number to 300,000 or 400,000. At the head of the whole Janizary force was the Aga of the J., whose power was limited only by the danger of revolt, and extended to life and death. The J. were always ready to break out into deeds of violence if their pay or perquisites were withheld. In times of peace, they acted as a police force. They served on foot; generally formed the reserve of the Turkish army, and were noted for the wild impetuosity of their attack. The sultan's body-guard was formed of them. The J., however, soon began to he very unraly; and their history abounds in conspiracies, assassinations of sultans, viziers, agas, &c., and atrocities of every kind; so that, by degrees, they became more dangerous to the sultans than any foreign enemies. The attempts of the sultans to reform or dissolve them were always unsuccessful, till Sultan Mahmoud II., in 1826, being opposed in some of his measures by the J. in Constantinople, displayed the measures by the J. in constantinopie, taspinged the flag of the Prophet, and succeeded in arousing on his own behalf the fanatical zeal of other portions of his troops. The J., descreed by their aga, and other principal officers who remained faithful to the sultan, were defeated, and their barracks burned, when SMMO of them perished in the flames. A proclamation of June 17, 1826, declared the Janizary force for ever dissolved. All opposition was defeated with bloodshed. Not fewer than 15.000 were executed, and more than 20,000 were banished.

JAN MAY'EN'S LAND, an island in the Arctic Occao, named after a Dutch navigator by whom it was discovered in 1611. It lies between Iceland and Spitzbergen, and is the northernmost known volcanic land. Its highest point is the volcano of Beerenberg, 6640 feet high, a conical, snow-covered mountain, from which flames and smoke have been seen to proceed, and the sides of which exhibit immeuse glaciers and frozen waterfalls. Another volcano, called Esk, about 1500 feet high, was discovered by Scoresby in 1817. An interesting account of the island is to be found in Lord Dufferin'a Letters from High Latitudes.

JANSEN, CORNELIUS, a celebrated divine, born of humble parentage in 1855, at Akkoi, near Leerdam, in Holland, from whom the sect of Jansenists derives its name. He was nephew of the well-known biblical commentator, and Bishop of Ghent, of the same name. The studies of J. were divided between Utrecht, Louvain, and Paris. Having obtained a professorship at Bayonne, he devoted himself with all his energy to scriptural and patristic studies, especially of the works of St Augustine. From Bayonne, he returned to Louvain, where, in 1617, he obtained the degree of Doctor, was appointed Lecturer on Scripture, and took a prominent part in the affairs of the university, especially in a contest with the Jesuits, on occasion of which he was sent upon a mission to the court of Madrid. In 1630, he was appointed to the professorship of Scripture; and having dis-tinguished himself by a pamphlet on the war with France, Mars Gallicus, he was promoted, in 1636, to the see of Ypres. In this city he died of the plague, May 6, 1638, just as he had completed his

of a theological controversy, the most important, in its doctrinal, social, and even political results, which has arisen since the Reformation. Its main object, in which it coincided with the scheme of doctrine already condemned in Bajus (q. v.), was to prove, by an elaborate analysis of St Augustine's works, that the teaching of this Father against the Pelagians and semi-Pelagians (q. v.), on Grace, Free-will, and Predestination, was directly opposed to the teaching of the modern, and especially of the Jesuit schools (see Molina), which latter teaching he held to be identical with that of the semi-Pelagians. In the preface, he submitted the work to the judgment of the Holy See; and on its publication, in 1640, being received with loud clamour, especially by the Jesuits, and at once referred to Rome for judgment, the Augustinus-together with the antagonist publications of the Jesuits-was prohibited by a decree of the inquisition in 1641; in the following year, it was condemned as heretical by Urban VIII. in the bull In Eminenti. This bull encountered much opposition in Belgium; and in France, the Augustinus found many partisana, who were animated by a double feeling, as well of doctrinal predilection as of antipathy to the alleged laxity of moral teaching in the schools of the Jesuits, with whom the opposition to the Augustinus was identified. See JESUITS. The most eminent of the patrons of the Augustinus were the cclebrated association of scholars and divines who formed the community of PORT ROYAL (q. v.), Arnauld, Nicole, Pascal, &c. Nevertheless, the syndic of the Sorbonne extracted from the Augustinus seven propositions (subsequently reduced to five) which were condemned as heretical by Innocent X. in 1653. Hence arose the celebrated distinction of 'right' and of 'fact.' The friends of the Augustinus, while they admitted that in point of right the five propositions were justly condemned as heretical, yet denied that in point of fact these propositions were to be found in the Augustinus, at least in the sense imputed to them by the bull. A further condemnation was therefore issued by Alexander VII. in 1656, which was rigidly enforced in France, and generally accepted; and in 1668, peace was partially restored by Clement IX., at least all overt opposition was repressed by the iron rule of Louis XIV. The more rigid Jansenista, however, and at their head Antoine Arnauld, emigrated from France, and formed a kind of community in the Low Countries. On the death of Arnauld in 1694, the controversy remained in abévance for some years; but it was revived with new acrimony by the well-known dispute on the so-called 'case of conscience,' and still more angrily in the person of the celebrated Queenel (q. v.), whose Moral Reflections on the New Testament, although published with high ecclesiastical authority, at various intervals from 1671 till his death, 1710, was denounced to the pope, Clement XI., as a text-book of undisguised Jansenism. This pope issued in 1713, in the constitution 'Unigenitus,' a condemnation in mass of 101 propositions extracted from the Moral Reflections, which, however, met with great resistance in France. The death of Louis XIV. caused a relaxation of the repressive measures. The regent, Duke of Orleans, was urged to refer the whole controversy to a national council, and the leaders of the Jansensist party appealed to a general council. The party thus formed, which numbered four bishops and many inferior ecclesiastics, were called, from this circumstance, the Appellants. firmness of the pope, and a change in the policy of to the see of Ypres. In this city he died of the the regent, brought them into dislayour. An elder plague, May 6, 1638, just as he had completed his was published, June 4, 1720, receiving the bull; great work, the Augustinus, Which proved the occasion and even the parliament of Paris submitted to

register it, although with a reservation in favour of the liberties of the Gallican Church. The Appellants for the most part submitted, the recusants being visited with severe penalties; and on the accession of the new king, Louis XV., the unconditional acceptance of the bull was at length formally accomplished, the parliament being compelled to register it in a lit de justice. From this time forward, the Appellants were rigorously repressed, and a large number emigrated to the repressed, and a rarge number emigrated to the Netherlands, where they formed a community, with Utrecht as a centre. The party still remaining in France persisted in their inveterate opposition

in France persisted in their inveterate opposition to the bull, and many of them fell into great, excesses of fanaticism. See Convulsionaries. In one locality alone, Utrecht, and its dependent churches, can the sect be said to have had a regular and permanent organisation, which dates partly from the forced emigration of the French Jansenists under Louis XIV., partly from the controversy about Quesnel. The vicar-apostolic, Peter Codde, having been suspended by Clement XI. in 1702, the chapter of Utrecht refused to acknowledge the new vicar named in his place, and angrily joined themselves to the Appellant party in France; many of whom found a refuge in Utrecht. At length, in 1723, they elected an archbishop, Cornelius Steenhoven, for whom the form of episcopal consecration was obtained from the French bishop Consecration was obtained from the French hishop Vorlet (titular of Babylon), who had been sus-pended for Jansenist opinions. A later Jansenist Archbishop of Utrecht, Meindarts, established Haarlem and Deventer as his suffragan sees; and in 1763, a synod was held, which sent its acts to Rome, in recognition of the primacy of that see, which the church of Utrecht professes to acknowledge. Since that time, the formal succession has been maintained, each bishop, on being appointed, notifying his election to the pope, and craving confirmation. The popes, however, have uniformly rejected all advances, except on the condition of the acceptance of the bull Unigenitus, and the recent act of the Holy See, in defining as of Catholic faith the dogma of the Immaculate Conception of the Blessed Virgin Mary, has been the occasion of a new protest. The Jansenists of the Utrecht Church still number about 5000 souls, and are divided over 25 parishes in the dioceses of Utrecht and Haarlem. Their clergy are about 30 in number, with a seminary at Americant's So far as they can be said to possess a theological system, it may be described as a compound of Jansenist and ultra-Gallican principles.

JANSSENS, ABRAHAM, a celebrated Dutch painter, is supposed to have been born in Amsterdam about 1569. Of a thoughtless and excitable disposition, he made himself completely miserable by his marriage with a girl of extravagant tastes, and spont his latest years in extreme want. The and spent his latest years in extreme want. The year of his death is unknown. Many churches in Flanders possess pictures executed by him; the most famous are the 'Burying of Christ' and a 'Madonna and Child,' in the church of the Carmelites at Antwerp. There are also good specimens of his style in the galleries of Munich, Visiona, Dreslen, and Berlin. J. displayed great vigour in drawing and designing; he was an admirrigour in drawing and designing, he was an able colonrist, and he certainly ranks next, among the historical painters of the period—though at a considerable distance—to Rubens—Cornells J., probably born in Flanders, died in Amsterdam in 1665, acquired a reputation as a very fine painter of portraits and historical subjects.—Another eminent artist of this name was VICTOR HONORIUS J. (born at Brussels 1664, died there 1739).

of the order Scutibranchiata, and of the same family (Haliotidæ) with ear-shells. The shell is very similar in form to that of a common snail, but thin

Common Oceanic Shell (Janthina fragilis). Shell with the animal, the float expanded.

a, head; b, mouth; c, tentacles; d, eyes; c, border of the mantle at the entrance of the branchial cavity; f, foot, the posterior part, which is flat; g, lateral expansion of the muttle, provided for swimming; k, toot, anterior part form-ing a sort of pooch; t, i, bunch of acrieted vestles, serving to suspend the molluse at the surface of the water; m, m, eggs suspended under the vesicular bunch; n, shelt

and beautifully pellucid. These molluses are remarkable as inhabitants of the open ocean, in which they swim at the surface of the water by means of a float formed of vesicles containing air, and secreted by the foot. To the under-surface of this float, the egg-capsules are attached. The vesicular float has no more anatomical connection with the animal than the shell has. The Janthinæ abound in the seas of warm climates; are plentiful in the Medi-terranean, but rare on the British coasts.

JANUA'RIUS, ST, a martyr of the Christian faith under Diocletian, was a native of Benevento, or at least became bishop of that see in the latter part of the 3d century. According to the Neapolitan tradition, he was taken prisoner at Nola; and the tradition, he was taken prisoner at Nola; and the place of his martyrdom, in 305, was Pozzuoli, where many Christians suffered the same fate. His body is preserved at Naples, in the crypt of the exthedral, and in a chapel of the same church are also preserved the head of the martyr, and two phials (ampuble) supposed to contain the blood. On three festivals each year, the chief of which is the day of the martyrdom, September 19, and on occasions of public danger or calamity, as earthquakes or eruptions, the head and the phials of the blood are carried in solemn procession to the high-altar of the cathedral, or of the church of St Clare, where, after prayer of greater or less duration, the blood, on the phials being brought into contact with the head, is believed to liquery, and in this condition is presented for the veneration of the people, or for the conviction of the doubter. It occasionally happens that a considerable time elapses before the liquefaction takes place, and sometimes it altogether fails. The latter is regarded as an omen of the worst import; and on those occasions when the miracle is delayed beyond the ordinary time, the alarm and excitement of the congregation rise to the highest pitch. Those who are curious as to the literature of the controversy regarding this celebrated legend, will find many docu-ments in the sixth volume of the Bollandist Acta Sanctorum for September.

JANUARIUS, St., Order of, an order of knighthood, founded by King Charles of Sicily (afterwards Charles III. of Spain), on the 6th July, 1738. It was abolished after the French invasion of 1806, and reintroduced in 1814. The badge is that of this name was VICTOR HONORIUS J. (born a body categorial white and red cannelled cross.)

ANYTHINA, a genus of gasteropodous molluscs objects represents St. Januarius in episcopal robes, a cold categorial white and red cannelled cross. A polytopher of the cold categorial white and red cannelled cross. The cold categorial white and red cannelled cross. A polytopher of the cold categorial white and red cannelled cross. The cold categorial white and red cannelled cross a cold categorial white and red cannel cannel cross a cold categorial white and red cannel cannel cross a cold categorial white and red cannel cannel cross a cold categorial white and red cannel cross a cold categorial white and red cannel cross a cold categorial white a cold categorial w with an open book. The round middle of the reverse shews a golden open book, and two phials partly filled with blood. The knights are either Cavalieri di Giustizia, who must count four noble generations, or Cavalieri di Grazia.

JA'NUARY, the first month of the year. It was, among the Romans, held secred to Jams (q, y), from whom it derived its name, and was added to the calendar along with February by Numa. It was not till the 18th c. that J. was universally adopted by European nations as the first month of the year, although the Romans considered it as such as far back as 291 a. The secretary of the property of the pr

JA'NUS AND JANA, two very old Latin divini-ties, male and female, whose names are merely different forms of Dianus (probably the Sun) and Diana or Luna (certainly the Moon). The worship of the former held a high place in the regards of the Romans. In every undertaking, his name was first invoked, even before that of Jupiter, which is the more singular, as Jupiter was unquestionably the greatest of the Roman gods. Perhaps it may be taken as a verification of the tradition, that Janus was the oldest of them, and ruled in Italy before any of the others came thither. He presided not only over the beginning of the year, but over the beginning of each mouth, each day, and the commencement of all enterprises. On New-Year's Day, people made each other presents of figs, dates, honey-cakes, sweetmeats, &c., wore a holiday-dress. saluted each other kindly, &c. The pious Romans Matulinus Pater ('Father of the Morning'). He is represented with a sceptre in his right hand, and a key in his left, sitting on a beaming throne (probably a relic of the original, or at least very old worship of J. as the sun). He has also two one worship of J. as the sun). He has also two faces (whence the expression applied to a deceiful person, 'Janus-faced'), one youthful, and the other aged, the one looking forward, and the other backward, in which some have professed to see a symbol of the wisdom of the god who beholds both the past and future, and others, simply of the return of the year. Numa dedicated to him the passage close by the Forum, on the road connecting the Quirinal with the Palatine. This passage (erroneously called a temple, but which was merely a sacred gateway, containing a statue of Janus) was open in times of war, and closed in times of peace. It is a striking commentary on the military habits of the Romans, that the place was shut only thrice in 700 years, First by Numa himself, again at the close of the first Punic war, and for the third time, under Augustus. It was also closed by Vespasian in 71 A.D.

JAPA'N (native name, Nipon—or Dai Nipon, Great Nipon—i. e., the Land of the Rising Sun), an island-empire of Eastern Asia, remarkable for the proud isolating policy of its rulers, and new claiming special consideration from its recent renewed relations with the civilised world.

Japon Proper comprehends four large islands, viz. Nipon the Japanese mainland), Sikok or Sikhoki, Kinsin, and Yesso, and extends from 31° to 45° 30° N. lat. It is divided into 8 provinces, 68 departments, and 62°2 districts. The empire of J.—the area of which has been estimated at 266,500 square miles—includes about 5800 small instances of the control of the contr

Physical Features. — The islands of J. appear to be of volcanic origin, and that part of the Pacific

on which they rest is still intensely affected by volcanic action. Earthquakes occur very frequently in J., although certain parts of the country are exempt. The Japanese reckon that, on an average, some one of their cities is destroyed every seven years by this agency. J. has been called the land of mountains ; but though these are very numerous, and many of them volcanic, they are of moderate elevation, and rarely attain the limits of perpetual snow. The country generally is of moderate elevation, with fertile valleys, picturesque landscapes, and a coast indented with magnificent harbours; the soil is productive, rich in mineral wealth, and teeming with every variety of agricultural pro-duce. The great volcanic mountain Wunsentake, on a promentory of Kiusiu, reaches to the line of perpetual snow, and is both feared and worshipped by the Japanese. The celebrated and sacred Fusi-yama ('Rich Scholar Peak'), the Parnassus of J., is an extinct volcano, the highest peak of which reaches to the height of 14,177 feet. Springs, lakes, and rivers are numerous; but the last, being sandchoked and very impetuous, are valuable chiefly for the purposes of irrigation.

Our knowledge of the climate of J. is yearly increasing. June, July, and August are the months of rain, which sometimes descends in unceasing The months of October and November terrents. are the pleasantest and most genial of the twelve, when fine weather is enjoyed without the scorching heat of summer. The summers are very hot, and the winters in the northern parts almost Siberian; the thermometer rising to 96° in the shade in the former, and sinking to 18° below zero in the latter season. Alcock says: 'The thermometer in the shade (during the summer) ranges from 70° to 85°. and averages 80 between the morning and the evening, while it is sometimes below 70° at night.' Hurricanes and waterspouts are frequent; dense fogs hide the sun, sometimes for four or five days together; and about the change of the monsoons, typhoons and equinoctial gales frequently sweep

the Japanese seas. l'egetable Productions.-In Hodgson's Japan will be found a systematic catalogue of Japanese flora by Sir William Hooker. We can only mention a few of the most noteworthy trees and plants. Chesnut, oak (both decidnous and evergreen), pine, beech, elm, cherry, dwarf-eak, elder, sycamore, maple, cypress, and many other trees of familiar name abound. The evergreen oak and the maple are the finest of all Japanese trees. The grandest forests of pine, and oaks of prodigious size, grow in Yesso; but the Rhus vernicifera or lacker-tree, the Laurus camphora or camphor-tree, the Broussonetia papyrifera or paper-mulberry, the Rhus succedanea or vegetable wax-tree of J., are among the remarkable and characteristic trees of the country. Bamboos, palms, including sago-palms, and 150 species of evergreen trees, likewise flourish. Thus, the vegetation of the tropics is strangely intermingled with that of the temperate or frigid zone ; mingled with that of the temperate of right and palm grow side by side with the pine, the oak, and the beech, and coniferse in great variety. Nymphæas and parnassia till the lakes and morasses. The tobaccoplant, the tea-shrub, the potato, rice, wheat, barley, and maize are all cultivated. The flora of J. bears a remarkable resemblance to that of the North American continent. Agriculture is the chief occupation of the Japanese.

They are very careful farmers, and their farms are models of order and mentness. They bestow great care upon manures, and thoroughly understand cropping and the rotation of crops. The cultivated land is chiefly a light friable loam of

great fertility. It grows cotton, rice, wheat, maize, bair of the women is more abundant, but otherwise buckwheat, millet, potatoes, and turnips. The rice their dress very much resembles that of the men. harvest commences in October. Wheat is sown in In the country, a short cotton gown is often the drills in November and December, and reaped in May and June. Flails and winnowing-machines. similar to those used in England, are common.

Animals.—Wild animals scarcely exist in J., in consequence of the universal cultivation of the soil. A few wolves, foxes, and wild boars still roam in the north of Nipon. Wild deer are protected by law. The principal domesticated animals are horses, of which there is an indigenous race; oxen and cows, used only as beasts of burden; and dogs, held in superstitious veneration by the people. Birds are very numerous, and include two kinds of pheasants. wild-fowl, herons, cranes, and many species common both to Europe and Asia. There are few reptiles; and of insects, white ants, winged grasshoppers, and several beautiful varieties of moth, are conspicuous,

Mineralogy.—J. is very rich in minerals. gold mines of Matsumai and the north-east part of Nambu have long been celebrated; but the north Nambu have long been celebrated; but the bords of Nipon is, according to the Japanese, one continuous bed of gold, silver, and copper. Silver also comes from the islands to the west of Matsumai, comes from the isakinats and any an ewst or Matsumat, from the province of Shanday, and from the islands in the vicinity of Neagata. The iron mines of Yesso are sealed to European. The tind had and copper mines are worked within a few miles of Arkodadt. The sulphur of Yesso and the adjacent sites is almost inexhaustible, and of wonderful purity. In its abundant supply of coal, J. resembles Great Britain; coal-beds extend from Nagasaki and Fizen to Yesso and Saghalien. Basalt, felspar, green-stones, granites red and gray, rock crystal, agate, carnelian, amber, scoria and pumice-stone, tale, alum, and other minerals are found in greater or

Inhabitants.—Ethnologists have referred the Japanese to different types of mankind: Latham classifies them as Turanians-a tribe of the Asiatic peniusular stock; Pickering, as Malays; Prichard, as belonging to the same type as the Chinese; and in the Narrative of the United States' Expediin the Narrative of the United States' Expedi-tion, they are ranked as a branch of the Tartar family. Physically, the Japanese is distinguished by an oval head and face, rounded frontal bones, a high forbead, slightly oblique eyes—the irides of a brown-black colour, the eyebrows heavy and arched. The complexion varies from a deep copper colour to the fairness of western nations, but is more frequently of a light-olive tint. The expression of the face is mild and animated. The mental and moral characteristics of the Japanese are a proud, sensitive, and somewhat vindictive disposition, punctilious notions of honour, together with pride of birth; and they are generally described as a friendly race, good-humoured, contented, industrions, intelligent, brave, frank, manly, energetic, and polite, with the exception, however, of the military, feudal, and official caste. The town costume of the Japanese gentleman consists of a loose silk robe extending from the neck to the ankles, but gathered in at the waist, round which is fastened a girdle of brocaded silk. Over this is worn a loose, wide-sleeved jacket or spencer, decorated with the wearer's armorial device. A cylindrical cap made of bamboo and silk, white stockings, and neat straw sandals, and silk, white stockings, and neat straw sandals, complete the attire. Tronsers are only worn by official persons on occasion of special ceremony. A head entirely shaven is the distinctive mark of priests and the higher class of medical practitioners; priests and the injure case of memoral practiconers; aristocratic sasses interacts a personal interview in others, the hair is shaved off about three inches to the bride and bridgeroom previous to marriage, in front, combed up from the back and sides, and but this rule is now much relaxed. Prostitution gladed into a tuff at the top of the back, where it is a legalised custom; and a father may sell his is confined by pins of gold or tortoise-shell. The idaughter, for this purpose, for a term of years;

 Kiogoku Notono Kami.

only clothing, and the lower classes go almost in a state of mulity. The men are generally elaborately tatooed over the greater part of the body with figures of men and women, bright-blue dragons, lions, tigers, &c. The women have a mania for painting and powdering their skin.

Manners and Customs.—The most remarkable custom of the Japanese is that of Harri-kari or Hara-kiru (or Hara wo Kiru, i. e., 'belly-cut'), a legalised mode of suicide, by making two cross-cuts on the abdomen with a sharp-pointed knife. This custom, according to some recent accounts, is now less frequent, and the ceremonies with which it was once performed have become obsolete. There are still, however, professors of the art in most large cities. The enrious custom of nay-boen or naibun consists 'in ostentatious secrecy as regards events, or incognito in reference to persons.' Well-known events are totally ignored, and individuality is unre-cognised under shelter of the nay-boen privilege.

The social position of women is, in some respects, more favourable than in most pagan countries. The ladies of Japan, however, live in strict seclusion. and little is known about them. Female education is not neglected. Polygamy is not allowed, but the power of divorce is permitted to the husband by law. The laws against adultery on the part of the wife are severe, and death is the penalty, which may be inflicted by the hushand. He, on the contrary, may take as many concubines as he pleases or can afford. The marriage ceremony is an important part of social etiquette; the families of both bride and bridegroom meet and celebrate the event. Saki flows abundantly, and great feating and hilarity prevail. When a maiden marries, her teeth are blackened, her eyebrows plucked out, and artificial possible extent. The Chinese custom of affiancing children is followed by the upper classes, and aristocratic usage interdicts a personal interview

whitst the Japanese gentleman, notwithstanding his high notions of honour, often chooses his wife from amongst the inmates of those houses of illfame, which are at once supported and controlled by government. The bath is a great institution in J., and forms a kind of people's parliament. It is the general custom throughout the country for men and women to bathe together, with a total absence of decorum, but without sense of immodesty. J., the social position of every man is fixed by his birth, and the line that separates class from class is not only clearly defined, but impassable. Daimios and saimios, priests and soldiers, are considered to belong to the higher classes; and in the others are included medical men, inferior government officials, merchants, retail dealers, and labourers. There are eight classes of society, half of which belong to the upper, and the other half to the lower ranks of society. Men of rank only can enter a city on horseback. The ordinary vehicle in J. is a description of palanquin; the common sort, made of bamboo, is called a cango; the better kind, made of lacquered wood, a norimon. The Japanese manifest great regard for the dead. The ancestral tablet (wei-nae) is fashioned on the Chinese model, and is placed in the family shrine with the household gods. In a Japanese cemetery, the solid and elaborately carved granite monuments are beautiful specimens of architectural taste. Each body is buried in a sitting posture, with the hands folded in the attitude of devotion; and the coffins are all circular. Japanese observe many holidays, and celebrate the opening of the year in the Chinese fashion. There are, too, many holidays of a religious character, but the great national festivals are five in number. The Japanese are a theatre-loving people, and inveterate gamblers. They delight in wrestling—their national sport—perform wonderful feats in spinning tops, are very expert jugglers, and excel in archery. Fish and rice are the staple food of the people, and tea and saki (a spirit distilled from rice) their beverages. The population of J. is estimated at about 30,000,000 or 33,000,000.

Imperial Government.-The government of J. may be briefly described as an oligarchy, formed by two councils of state. It is generally represented that there are two emperors, viz., the Mikado or spiritual emperor, and the Siogoon (from Ta-tsiang-kiun, the Chinese term for 'the great chief or commander of the army') or Tycoon (Chinese, Tai Koon, i. e., 'Great Lord'), as he is called in recent treatics, the secular emperor; but the Japanese, from the highest to the lowest, recognise one sovereign only, viz., the Mikado, who dwells at the sacred capital Miako, and is the only emperor de jure-the descendant of a long line of kings. The Tycoon was the head of the executive, solely as the lieutenant or generalissimo of the Mikado, from whom he received his investiture; but was virtually emperor until the conflict between the Mikado and the Tycoon in 1867-1868 resulted in the total abolition of the Tycoonate. This double sovereignty arose, it appears, as follows: J. was consolidated into one empire 600 B. C., and the most powerful of the native chieftains became the imperial ruler, During subsequent civil wars, the administration of military affairs was vested in an hereditary 'generalissimo, commander-in-chief, or lord-lientenant of the empire. This high officer, in the person of Yoritomo, obtained the greater share of sovereign authority in 1143, under the title of Shogoon-the true appellation, aignifying 'generalissimo', and by which it is now be-ginning to be recognised among Europeans; and in 1585, Taiko-Sama, at that time Shogoon, deprived the reigning Mikado of what yet remained to him of executive power. The consent of the Mikado was still required-nominally, at least-to give validity to the acts (Vol. i. p. 410.)

of the Shogoon, which were professedly done in the name of the de jure emperor. It appears, however, that the Shogoon himself was at a later date shorn of much of his power by the two councils, composed of the daimios or territorial lords and princes; and these form the imperial cubinet at Yeddo, and the real executive government at the present time. The higher council of five is called *Go to sew*, 'Imperial Old Men,' or 'Imperial Senators.' The lower council, of even members, is termed Waka tosiyori, 'Young Old Men, or 'Junior Senators.' The office of Shogoon was hereditary in the line of mule descent; but if this failed, a member of one of those families originally allied by relationship to the Shogoon was chosen by the great dnimios of the empire, and the consent of the spiritual emperor was necessary to render the election valid. 'As a general summary,' says the Bishop of Victoria in his able and philosophical treatise on J., from which, and Sir R. Alcock's able work, this account of the government of the country has been principally derived, 'it will be apparent that while in China the theory of government is a bureaucraev -a form of administration carried on under an autocratic emperor, served by an aristocracy of literati raised from the democracy by literary trial and competitive examination, conducted without preference of birth, and in total absence of hereditary caste— Japan, on the contrary, is ruled by an aristocracy of 266 hereditary daimies or territorial lords of the soil, with a close oligarchy of inner councillors at their head, controlling the secular emperor, having their title to power grounded on the privilege of hereditary descent and caste, with all the wealth and prestige of the empire concentrated upon the capital, as the metropolis and seat of power. middle class is unrecognisable in such a system of government.

Two remarkable and leading features in the political system of J. are feudalism and espionage. imperial demesne consists of several provinces and towns, but the empire is divided, for the most part, into principalities, which are beld by the daimios or territorial princes directly from the crown. The feudalism of J. bears some resemblance to that which prevailed in England under the Plantagenets-we go back to the Europe of the 12th century. The duties of the feoffee are military service and payment of a stipulated rent. The army of the Tycoon amounted to 80,000 men, while the duinios together maintained an effective infantry and cavalry of 410,-000-the infantry being armed, disciplined, and nuaneuvred like the French soldiers. A number of Japanese officers were instructed by French military men in 1866-69. The navy consists of war-junks and sundry steamers. A jealous surveillance or spy system is

• The ministers told Alcock, however, that a written code exists, and he subsequently obtained a copy of printed laws and edicts; but "whether only a sectional portion, or the whole, yet remains to be ascertained," IVA in \$100.

established, and runs through every grade of society. The highest public officer, no less than the humblest citizen, is subject to this espionage; nor can the Japanese believe any country to exist without it. Mr Oliphant, speaking of an interview between Lord Elgin and the officials of J., says: 'So when Lord Elgin and the officials of J., says: 'So when everybody was watching everybody else, it was only natural that the Japanese should wonder who was watching us. They solved this difficulty in an amusing way. Finding that there was only one British minister on board, but observing also that his letter had so was been successful. In the least offinative way possible, that Kincardine, who was nowhere visible, they supposed to be engaged in keeping his eye on Elgin.' keeping his eye on Elgin.

In addition to the crown lands, the revenues of government are raised by taxes upon houses and land within the precincts of the towns; and there is an export duty of 5 per cent. on all articles of commerce. Forced loans are also, at certain times, exacted from the public. A modified system of slavery exists: it is a contract by which an indi-vidual sells his services for a stated period, at the

expiration of which time he is again free.

no unimportant part in the history of the country, and rule large provinces with despotic authority and almost independently of the supreme government. There are now 266 vassal chieftains of the first class. These are the daimios proper, with revenues varying from 10,000 to more than 1,000,000 kokus or measures of rice-the koku of rice being equivalent to 13s. 10d. in money. The saimios are petty baronial chiefs, with revenues below 10,000 kokus. The policy of the government is to divide the territories of these princes, and so, by weakening their power, to bring them more under its authority. The greater part of the land is divided amongst these grandees, who receive seven-tenths of the produce of rice, whilst three-tenths are reserved to the

Religions of Japan.—The two principal and national religions of J. are Sintuism or Sin-syuism. (from sin, the gods, and syu, faith), the ancient creed of the country, and Buddhism, which is exotic and comparatively modern. The doctrine of Confucius, as held by the literati of China, has also considerable influence under the name of Sooto, or 'the way or method of philosophers;' but it is less a religion than a system of morals and philosophy. I. Sintuism. The hierarchy of Sin-syu is composed of the Mikado, two ecclesiastisyd is composed of the mindio, two ceressar-cal judges, together with the monks and priests. The chief object of Sintu worship and belief is Ten-sio dai-sin, the Great Sun-goddess. The Mikado is held to be the direct descendant of the sun-goddess, and, as such, unites in his person all the attributes of the deity. The minor deities of Sintuism are very numerous, for every hero, warrior, patriot, or public benefactor receives a regular apotheosis and cauonisation at his death, and is henceforth reckoned among the kami or demi-gods. Every district has its patron saint or kami; and the shrines erected to the popular

divinities are innumerable. Sintu temples are usually built on elevated ground, and surrounded by groves; no idols are visible in them; but above and around, written sentences are inscribed. mirror, as an emblem of the purity required in the worshippers, is placed on the altar. The chief doctrines of this indigenous religion of J. arc-1. Inward purity of heart; 2. A religious abstinence from whatever makes a man impure; 3. A diligeut observance of the solemn festival and holy days; 4. Pilgrimages to holy places; and 5. According to some, chastising and mortifying the body. The form of worship is simple: the worshippers first wash themselves in the font, pray opposite the mirror, throw a few cash into the money-box, and finish by striking a bell, to intimate that their religious duties are over.

2. In J., Buddhism, which was introduced 552 A.D., has been modified by its contact with Sintuism, with which it has to a certain extent an export duty of 5 per cent. on all articles of summerce. Forced loans are also, at certain times, analgamated. No less than eight Buddhist sects acted from the public. A modified system of avery exists: it is a contract by which an individual sells his services for a stated period, at the piration of which time he is again free. The daminos, or certained princes of Japan, play saw at one of the temples in that country (see

Japanese Temple, - Oliphant's Japan.

three-tenths are reserved to cultivators. The great feudal barons must spend every alternate six months in his Tea Weeks in Japan, p. 34). 'Amongst the barons must spend every alternate six months in his Tea Weeks in Japan, p. 34). 'Amongst the barons must spend every alternate six months in his Tea Weeks in Japan, p. 34). 'Amongst the Sarah Sara worshippers so nearly approaching the appearance of a Christian assembly, and the details of an ordinary Christian service.' Amongst the more orunary carstan service. Amongst the more chicated classes, the same sceptical indifference to the religious observances of the multitude that prevails in China is observed. The religious duties of the Japanese consist chiefly in worship at the temples, and the observance of festivals, pligrimages, periodical worship of tutchary divinities, reverence to parents, obelience to megistrates, and more than

all, the customary offerings at ancestral tombs.

The Japanese Written Language.—The principle of duality, which pervades the life of the Japanese, extends to their mode of writing, for two distinct alphabets and kinds of writing for two distinct alphabets and kinds of writing are in use. There are 1st, the ideographic system of Chinese hiero-glyphic symbols, which dates from the 3d c. A.D.; and 2dly, the phonetic syllabarium, of more recent invention, consisting of an alphabet of 47 characters, and a few supplementary monosyllabic sounds. Prior to either of these, some antique form of writing now consigned to oblivion, is supposed to have existed.

The phonetic alphabet, invented about the year 810 A. D., is known as the Hiragana form of character. In process of time, this system was rendered more complex by the addition of variations, and this led, apparently, to the introduction of another and simpler alphabet, entirely without variants, and known as the Katagana character. these phonetic systems are written in perpendicular It is not a little remarkable that the Chinese ideographic symbols retain their ascendency over the indigenous alphabets, and are adopted almost exclusively for diplomatic documents and the higher class of books. In common life, the Chinese written language is in familiar and constant

There is no similarity whatever between the spoken languages of China and J.; the latter-one of the softest tongues out of Italy-is not very difficult of acquisition, and is without the Chinese system of intonations; it is not monosyllabic, but what Dr Latham calls agglutinate.

The literature of J. is abundant and various and includes works on history and science, encyclopædias, poetry, prose fiction, and translations of European works. Besides original writings, the Japanese have adopted the whole circle of Chinese Confucian literature; the Chinese classics indeed form the basis of their literature, system of ethics,

and type of thought.

In the mechanical arts, the Japanese have attained to great excellence; especially in metallurgy, and in the manufacture of porcelain, lacquer ware, and silk fabrics; indeed, in some of these departments works of art are produced, so exquisite in design and execution, as to more than rival the best products of Europe. The Japanese have long understood lithochrone-printing. Their drawings of animals and ligures generally are wonderfully graphic, free, and true to nature; but in landscapes they fail, from erroneous perspective; and of the art of painting in oils, they are entirely ignorant.

A Junk in the Bay of Yeddo, from a native drawing .-Oliphant's Japan.

A commercial intercourse with J. has sprung up since the opening of certain Japanese ports to European merchants, and foreign settlements have been formed. Tea and silk are the staple exports. Printed cottons, camlets, shirtings, ginghams, flannels, canvas, and window-glass are amongst the imports from Europe chiefly in demand.

The sapec, or iron cash (the 5320th part of a dollar), is the base of the Japanese currency, and gold rio or cobang, which has already almost disap- 1869.

exchanged at the rate of three to a dollar. The fol-lowing illustration represents a copper coin. The car-

Japanese Copper Coin.-Hodgson's Japan.

lier treaties failed to establish a fixed standard of exchange; and when the trade was first opened to Europeans, gold coins were bought at one-third their real value; but the Japanese discovered their error,

and stopped the export of gold money.

The number of foreigners in J. is at present very small. At the end of 1862 the foreign community at Kanagawa consisted of 126, of whom 38 were Americans. In 1864 the permanent foreign residents at Kanagawa had increased to 300, not counting soldiers, of whom 80 were Americans. At Nagasaki, the 2d port thrown open to trade, in Jan. 1866, there were 166 foreigners, of whom 32 were Americans. Hakodadi, in the N. of Japan, the 3d port opened to traders, was deserted by nearly all the foreigners settled there, it being found impossible to establish any satisfactory intercourse with the natives.

The trade of Japan with Great Britain has been of late years constantly on the decline. In 1867 the imports from Great Britain were £1,545,386, and the exports to the same, £317,799; in 1868 the imports were £1,112,804, and the exports to the same, £188,-222; in 1869 the imports from Great Britain amounted to £1,595,868. The intercourse between Japan and the United States is constantly increasing. In 1862 but 2 vessels entered our ports from J., and none cleared for that country. In 1868, 14 vessels of 6941 tons entered our ports, with Japanese goods valued at \$2,429,-182; and 4 vessels, of 2564 tons, cleared, carrying domestic and foreign products valued at \$66,040. 1869, 17 vessels, of 7680 tons, entered, with cargoes valued at \$3,245,317, and 2 vessels, of 603 tons, eleared direct for J. with domestic goods valued at \$2.836,720, and foreign re-exported, \$1,119,341, a total of \$3,956,061.

In 1869, 8,574,299 pounds of tea were exported from Yokohama, of which 6,988,680 pounds were received at N. York, and from Nagasaki, Hiogo, and

Osaca, 7,355,514 pounds were exported

Foreign commerce is still opposed by the government of Japan, though several treaties have been made with commercial nations: with the U. States in 1854-7-8; Great Britain in 1854-8; Russin and the Netherlands in 1855; France in 1859; Portugal in 1860; Russia and the Zollverein in 1861; Switzerland is their only real circulating medium - the people in 1864; Italy in 1866; Denmark in 1867, and Austria 18 their easy cent customers the self-order of the self-order of the ports of Nagasaki, Kanagawa, Yoko-walned, previous to Jan. 1868, at 5x 64. It is under-stood that a new coin of 4 ichibas will replace the opened to foreign commerce. Yeldo was opened in

On Jan. 6, 1869, a new era in the foreign political intercourse with J. commenced; on that day the Mi-kado or Emperor emerged from his seclusion, and, disregarding the traditions which forhade the 'harbarian' to gaze on his sacred countenance, received in state the foreign ministers residing at Yeddo, and exhibited an earnest desire to maintain peaceful relations. In October of 1869, when a treaty was signed between the Mikado and the Austrian admiral, the former presented the latter with a letter for the Emperor of Austria, written by his own hand-a most remarkable instance of departure from immemorial usage. The Japanese government, however, has shown itself very hostile to the Christian religion, only one member of the Parliament having dared to defend it, while 240 voted for

a resolution declaring it to be opposed to the state.

History.—The empire of J. dates from the 7th c.

B. C., and one emperor ruled the country till 1143, when Yoritomo possessed himself of the greater share of sovereign power, under the title of Siogoon, and towards the close of the 16th c., the Siogoon, Taiko-Sama, deprived the reigning Mikado of all executive authority, and became the de facto sovereign of Japan. The Portuguese commenced trading with the country in 1540; the mission of Francis Xavier followed; and at one time it seemed probable that J., as a nation, would embrace the Roman Catholic faith. The intrigues of the missionaries at last excited the alarm of the government, which, urged on by the jealous machinations of the Dutch, who had appeared on the scene in the year 1600, decreed the expulsion of the Portuguese and the extermination of the Christian religion. The Dutch now monopolised the trade, and submitted to the grossest indignities. The policy of exclusion and repression of Christianity was fully carried out by the celebrated Taiko-Sama, his successor Eyay-yes, and the imperial edict of 1638
A.D. Notwithstanding several attempts on the part of European nations to open intercourse with J., the government maintained its isolation until the country was opened to the five great western powers by the American treaty of March 31, 1854, the result of the United States' Expedition under Commodore Perry. The Dutch now got rid of their most galling conditions of trade. The Russian admiral negotiated a treaty, October, 1855. The Dutch secured further privileges; and in 1858—1869 followed American, English, French, and Austrian treaties. Thus J. once more took its place amongst the family of nations.—See *The Capital of the Tycoon*, by Sir Rutherford Alcock, K.C.B., &c. (Lond. 1863); *Ten* Kutherford Alcock, K.C.S., &c. (Lond.) Pumpelly, Across America and Asia (N. Y. 1870).

JAPA'NNING is the art of giving a coating

tures, by which a resemblance is produced to the beautiful lacquered wares of Japan and China. The term is more generally applied in this country to metal-works upon which a dark-coloured varnish to metal-works upon which a dark-coloured varmes is applied with heat, but the process is quite as extensively applied to papier-mâché works. See LACQUERINO. The japanned works of our manu-facturers are chiefly non and tin, such as coal-boxes, tin canisters, and other articles, which are thereby made more ornamental, and are at the

same time protected from rust.

same unie protected from rists.

The japanning material consists of anime or copal varnish, alone, or mixed with irony-black, to produce a black japan; or with asphalt, to produce a dark or light brown, according to the quantity used. For very cheap timed wares, a single coating is all that is usually given. After being varnished, they are put into a hested over for a time, after which they are ready for use; but in the case of more valuable articles, such as the handsome coal-boxes of iron which are now extensively manufactured, and which are still further svely manuscured, and which are sun factors ornamented by gilding and painting, several coats of black japan varnish are applied, each being dried in the oven previous to the application of the next, so that a coating of sufficient substance to bear polishing is thus obtained. Rotten-stone and Tripoli powder are used by the polisher, and a beautiful surface is obtained, in no respect inferior to that of polished jet. The polishing powders are at first applied with leather, but the finishing is done by women, who use the palms of their hands

only with small quantities of Tripoh.

The beautiful black surface thus produced is admirably adapted for decoration by gilding; and much taste is now shewn in these matters by our manufacturers, who surpass all others in the high finish and cheapness of japanned wares. Under LACQUERING will be given the Japanese process, which is thus imitated on metal, under the name of

japanning, in Europe.

JA'PHET, in Heb. Yepheth, a word apparently derived in Genesis from pathals, 'to open,' trop, perhaps 'to stretch forth,' and hence supposed to mean 'widely dispersed.' Gescnius and other scholars, however, suggest a derivation from yaphah, 'to be fair' or 'beautiful,' in allusion to the fair complexions of the Japhetic or European races.

According to the Hebrew record, J. was the second son of Noah, whose descendants peopled first the north and west of Asia after which they proceeded to occupy 'the isles of the Gentiles,' i. e., all the region about the Levant and the Ægean Sea, J. has at a later period, in Talmud and Midrash not merely from its similarity to the Greek name Japetus, the supposed founder of the human race been used as a typical expression for 'Greek.' Cf. Meg. 71, b.; Ber. R. 40, b. &c.

JAPU'RA, or CAQUETA, a river of South America, and tributary of the Amazon, rises in the Granadian Andes, in lat. 1° 26' N., long. 76° 50' W., and joins the Amazon about 55° 50' E. long. Its entire length is upwards of 1000 miles; the navigation is impeded by cataracts.

JARGONI'SING is a phenomenon observed chiefly in acute mania; it consists in the utterance of uncouth and unintelligible sounds, which may resemble articulate words, or be little more than harsh ejaculations and bellowings. This symptom must not be confounded with those imitations of foreign tongues or provincial idioms, or the perver-sions of the faculty of language characteristic of mania and other forms of alienation, as these sounds JAPA'NNING is the art of giving a coating of thought or manifestations of feeling. They stand

in the same relation to the excitement and violence, as the rapid motion, the furious gesticulation, and the tendency to injure and destroy everything that is seemly and harmonious. The tone in which they intense passion thrills through every muscle, through those of the vocal apparatus as well as of the arm raised to strike. Jargonising is, in all probability, involuntary. It occurs at the commencement or crisis of mania, when the power to control the ideas and to regulate motion is most impaired. It may, however, be the result of volition, so far as that the individual desires and determines to speak, but fails from the rapidity or intensity of his emotions to call into action, and co-ordinate the organs engaged in articulation. Such utterances may be heard in soliloquy, if the phrase may be used, and during sleep. The feature has been accepted as pathognonionic of mania. It has, however, been noticed in the delirium of certain stages of fever and of drunkenness, which are mental states depending upon blood-poisons. During periods of profound abstraction, similar sounds are said to have proceeded from the lips of same and healthy men. In all these instances, the natural operation of the will would appear to be enfeebled or suspended.

JARNAC, BATTLE OF, was fought at the town of that name, in the department of Charente, France, March 13, 1-509, between 26,000 Catholics under the Duke of Anjou, afterwards Henri HL, and 15,000 Huguenots under Louis, Prince of Condé, The latter were completely routed. See CONDÉ

JAROSLAY, GOVERNMENT or, one of the central provinces of European Russia; area, about 14,000 square miles; pop. in 1864, 969,642. The soil is generally not fertile; it landly supplies the wants of the inhabitants, and forces them to be industrous, so that the province furnishes nearly the whole of Russia with the best carpenters, masons, smiths, &c. The staple industry is dressing, spinning, and wearmostly near Jaroslay. Ughteh, and Velikov-Selo. In the northern districts of Mologa and Poshekhonje the whole population of many villages manufacture mails, springs, and other articles of hardware. The inhabitants of the Rostof district have the reputation of being the best kitchen-gardners and lowl-breeders of the empire. The Volga crosses the government from west to east, and gives a special government from west to east, and gives a special remarkably handsome both as to form and feature. The government is divided into nine districts.

JAROSLAV (pron. Yaroslaf), capital of the government of that name, in European Russia, is a large and fine town, situated on the right banks of the Volga, and its affluent, the Kotorosl, in lat. 57° 37 N., long 39 53 E, at a distance of 164 miles from Moscow. It is one of the most ancient Russian towns, and is said to have been founded by Jaroslaw the Great in the 10th century. During the feudal period, it was the seat of powerful feudal princes, and several times suffered from the invasions of the Mongols. The town has a vast gostinoidvor, or market-place, nearly as lively as that of Moscow. Though possessing large stores of linen fabrics, flax, Though possessing large stores of liner harres, has, iron, flour, and grain, J. is but a second-rate commercial place on the Volga, the principal trade being concentrated at Rybinsk, 54 miles up the and at Rostof. Chemical works, principally of white lead and minium, constitute a sort of speciality of the town and its staple industry; next come several tanneries, extensive flour-mills on the Kotorosl, and a recently built cotton-mill of 40,000 The once celebrated silk, and especially hnen and damask factories, are at present on the decline. The population of J. in 1863 amounted to 27,741 inhabitants, and is constantly increasing with the wealth of the town, owing to the development of steam-anvigation on the Volga and the Kama. The extensive trade on these rivers occupies at present no less than 150 steam-boats.

JA'SHER, BOOK OF (Heb. Sepher ha-ua-shar, 'the Book of the Upright; translated by the LXX.
Biblion tou Euthous, and by the Vulgate, Liber
Justorum; but the Peshito [Syriac version] has Sepher Hushir, 'Book of Praises or Hymns'), is one of the lost books of the ancient Hebrews, which is quoted twice (Joshua x. 13: 2 Samuel i. 18). Regarding its character and contents, there has been much speculation. Talmudic and later Jewish authorities identified it variously with Genesis (sometimes called 'the Book of the Upright'), Deuteronomy, Judges, &c., to all which notions there is the obvious and fatal objection, that the two quotations from it which survive are not to be found in any of these books, and could not possibly be found in the first two, as they refer to incidents which occurred at a subsequent period in the national history. conjecture of the Syriae and Arabic translators has been adopted by Dr Lowth, Herder, and other scholars, viz., that the Book of J. was a collection of national ballads—a Hebrew minstrelsy, in short recording the warlike deeds of the national heroes, or singing the praises of otherwise celebrated men. Gesenius is inclined to adopt the same view, and suggests that it may have acquired its name, suggests that it may have acquired as main, the Book of the Upright, from having been written chiefly in praise of upright men. Donaldson, in his recent work, Jashar, or Fragmenta Archetypi, Carminum Hebraicorum in Masorethico Veteris Testamenti Textu passim tessellata, contends for its being a composition of the age of Solomon, and a work of Nathan and Gad. He conceives that it originated in the desire of the more religious of the community to possess a record of the national history which should chiefly set forth the righteousness of the true Hebrews, and he attempts to extract from the so-called canonical books of the Old Testament such passages as he believed to have originally formed part of it. It must be added, however, that Dr Donaldson's theory has met with little favour either from the mass of German scholars or from the few in England who are competent to consider the question,

JASMIN, JACQUES, the most eminent modern patois poet of France, and, in the words of his ardent admirers, 'the last of the troubadours,' was born at Agen in 1798. He has given in his Soubenis a humorons account of his early life. According to it, he was of very humble birth, and was set to learn the trade of a hair-dresser, which agreed well with that of poet, as he himself says, because both are a kind of head-work. His poetry is full of beauty and power; the pathos of his serious pieces, and the wit and poignancy of his comic productions, are unequalled, and both have been received with great cuthusiasm in France, and even in other parts of Europe. He was made a Chevalier of the Legion of Ilonour in 1846, and died in 1864. J.'s principal works are, Me cal Mouri (1825); Lou Chalibari (The Charivari, 1825), a comic poem; L'Abuglo de Castel-Cuille (The Blind Youth of Castel-Cnille, 1836), translated by Longfellow; and Las Papillotos de Jasmin (The Curls of Jasmin), of which the first part appeared in 1835, and the second in 1843.

JA'SMINE, or JESSAMINE (Jasminum), a genus of plants of the natural order Jasminacea. This order is allied to Oleucea, and contains about 100 species of shrubs, some of them climbing, and many of them having exquisitely fragrant flowers. They

are chiefly natives of the warm parts of Asia. Many belong to the genus J., which has its calvx and corolla each 5 or 8-cleft, two stamens attached to and included within the tube of the corolla, and a two-lobed berry, one of the lobes generally abortive. The name J. is from the Arabic Yasmeen. The Com-MON J. (J. officinale) is a native of the south of Asia, but now naturalised in the south of Europe, and as far north as the Tyrol and Switzerland. In more northern regions, it is much cultivated in gardens. but does not easily endure very severe winters. It but does not easily endure very severe winters. It is a shrub from six to ten feet high, with evergreen pinnate leaves, the terminal leaflet the largest, and very fragrant white flowers. The flowers were formerly employed in melicine, for strengthening the nervous system, but are now only used for preparing Oil of Jasmine, a delicious perfume. The commercial oil of jasmine, however, is not the pure essential oil, but merely oil of ben flavoured with it, and is prepared by placing layers of the flowers alternately with layers of cotton soaked in oil of ben.—J. grandiflorum, a native of the East Indies, has flowers still more fragraut, from which, and from those of J. Sambac, oil of jasmine is also made. The flowers of J. Sambac are often scattered about in houses and temples in the East Indies, to diffuse their fragrance. -Several other species, some with erect, and some with twining stems, are not uncompany in gardens and green-houses. Some have white, and some have rellow flowers.—Oil of jasmine cannot be obtained from J. flowers by distillation.

JA'SON. See ARGONAUTS.

JASPER (Gr. iaspis), a mineral generally regarded as one of the varieties of Quartz (q. v.), and distinguished by its opacity, owing to a mixture of clay or other substances with the silica of which it is chiefly composed. There are many kinds of J., some of them of one colour, as brown, red, yellow, green, white, blue, or black, and some variously striped, spotted, or clouded with different colours. J. is a very abundant mineral; it is found in veins and embedded masses in many rocks, sometimes appears as a rock of which whole hills are formed, and is very common in the shape of pebbles. It has been prized from the most ancient times for orna-mental purposes, as it takes a high polish. Many kinds of it are very beautiful; and it can often be obtained in pieces of large size, so that it has been much used not only for rings, seals, and other small articles, but for the decoration of palaces. One of arciacis, but for the decoration or palaces. One of the best known kinds of J. is found in Egypt, and is therefore called Egyptian Jasper. It is generally yellow, prettily mixed with brown.—J. with very distinct stripes is called Ribbon Jasper.—The kind called Porcelain Jusper is rather rare. It is often full of minute holes, or is cracked in all directions. It is often It is regarded as a kind of natural porcelain, formed by the action of fire.

JA'SSY, the chief town of Moldavia, one of the provinces of Roumania, is picturesquely situated on the slope of the Kopoberg Mountains, near the borders of Bessarabia, and about ten miles west of the Pruth. It is irregularly built and dirty, and in its crooked streets the palatial mansion of the Bojar—the Moldavian noble—alternates with huts of the most inferior description. It centains about 90 ecclessastical edifices, one of which dates county, formerly the residence of the Prince of Moldavia. The streets are covered with dust in summer and with mud in winter, on which account, conveyances are here in great requisition, and every one except the Jew and the mendicant employs a dreaky. In J, there are 1300 private carriages, 5000 droskies, and 12,000 horses. The manufactures

of the town are few; there is, however, considerable trade in agricultural produce. Pop. 90,000, of whom about 30,000 are Jews.

JASZBERE'NY, a considerable town of Hungary, in the county of Jasygia and Kumania, is situated on both banks of the Zacyva, 42 miles east of Pesth. Pop. 19,000, who are employed in agriculture and in the trade in ocrn, cattle, and horses.

JATAKA (literally, 'relating to birth') is with the Buddhists the name of a work or a series of books containing an account of 550 previous births of Sakya Muni, or the Buddha. Several tales that pass under the name of Æsop's fables are to be found in this collection of legends.

JATIVA, or XATIVA, SAN FELIFE DE, a town of Spain, in the province of Valencia, 22 miles south of the city of that name. Its climate is delicious, and the well-watered plain on which it stands is luxuriant in fruits and flowers. Its trade and manufactures are unimportant. Pop. 13,200.

JAU'ER, an interesting old town in Silesia, Prussia, situated on the Neisse, 10 miles southsouth-east of Lieguitz. The town is famous for its sausages; and there is a weekly com-market, which has been regularly held since 1404, and is the most important in Silesia. J. was formedly a very prosperous town, being the only market for the lineatrade of Silesia; but the Thirty Years' War did much to reduce its extent and prosperity. Pop. 7850.

JAU'NDICE, a yellow colour of the skin and conjunctiva of the eye, arising from the presence of the colouring matter of the bile in the blood and tissues, is a symptom of various disordered conditions of the system, rather than a special disease.

With this colouring of the skin and eyes the following symptoms are associated: the fixees are of a grayish or dirty-white tiut, in consequence of the absence of bile, and the urine is of the colour of saffron, or is even as dark as porter, in consequence of the presence of the colouring matter of the bile. There is sometimes, but not in the majority of cases, au extreme itching of the skin. It is a popular beheft, as old as the time of Lucretius—

Lurida præterea fiunt quæcunque tuentur arquati that to a jaundiced eye everything appears yellow. This, however, like the preceding, is only an

occasional symptom.

The most abvious cause of jaundice is some obstruction in the gall-ducts, preventing the normal flow of bile into the intestine. This obstruction may arise in any of the following ways: 1. It may be caused by the impaction of a gall-stone in the common hepatic duct. See Liver. In this case, the jaundice is usually of short duration, and disappears soon after the gall-stone has passed into the intestine. 2. Another cause of jaundice is the obstruction of the gall-ducts by cancernus disease of the head of the pancreas, by tumours in the liver, or by a diseased condition of the duodenum, the portion of small intestine iuto which the common hepatic duct opens. In these cases, the obstruction is usually permanent, and causes a persistence of the jaundice. 3. Obstruction or closure of the gallducts sometimes occurs in the inflammation of the there that is brought on by spirit-drinking, and sometimes may be caused by inflammation originating in the ducts themselves, which, from their small size, may be readily closed up by inflammatory swelling of their mucous membrane, 4. The jaundice that occasionally arises from constipation, or that occurs during the advanced stage of pregnaucy, is probably caused by pressure upon the common hepatic duct.

But although jaundice is frequently caused by some of these mechanical impediments to the flow of bile into the intestine, it results primarily and solely in a great number of cases from the secretion of bile being suppressed or deficient. The secretion way be suppressed or deficient. The secretion may be suppressed on the case from the secretion way be suppressed on the case of the suddle mental shock or by continued anxiety. Various posions in the bloed may also suspend the secretion of bile to such an extent as to cause jaundice. It may be produced in this way by the salts of copper and of mercury, by opium, and by the poison of seprents; and it often occurs, from the poisoned state of the blood, in the course of fevers, especially the virulent fevers of tropical climates.

The prognosis in jaundice is generally favourable, except when it depends upon structural disease of the liver, or on mental shock or anxiety. The treatment must be chiefly guided by reference to the conditions which give rise to it in any particular case, and should never be attempted without

JA VA. 'the Queen of the Eastern Archipelage,' a most valuable colonial possession of the Ketherlands, is situated in lat. 5° 52"—8 46° 8, and long. 105° 10"—114° 33° E. It is washed on the N. by the Sea of Java, on the E. by the Strait of Sain, on the S. by the Strait of Sain, and the S. by the Strait of Sain, and the Sain of Sain of the Sain of S

In 1889, the population of J. and Madara (q. v.) amounted to L5,53,000, having more than doubled in 30 years. The census of 1862 gaze 20,323 Europeans, 139,360 Chinese, and 24,543 Arabians and other Orcatals. The native Javanese belong to the great the remainder being 'beathen,' whose religion is a degraded superstition. In moral habits and civilisation, the Javanese are superior to the inhabitants of Sumatra and Celebea. There are 29 Dutch Protestant, and 10 Roman Catholic elergym, n, all gaid by the government, which fixes their sphere of Labour, and strictly prohibits the prossiytising of the natives. They chelly labour among the Europeans, half castes, and intermediate races at the ports, and the natives of the intermediate races at the ports, and the natives of the interior are neither made and the control of the c

For upwards of thirty years, J. has been steadily advancing in prosperity. Its producing power is only limited by the amount of available labour, and notwithstanding the energy which the Dutch have duplayed in mercasing the breadth of cultivated hand, the greatest part of the bland is still in a state of nature. Rivels grown extensively for native consumptions, the still produced by the still

The countries which trade most extensively with J. are the Netherlands, Great Britain, China, and Japan. In the trade reports for 1860, Holland is set down as having imported into J. merchandise to the value of

£1.864.740, and specie to the value of £1.511.854. while Great Britain sent goods to the value of £991,-155. In the same year the exports from J. to Holland amounted to £6,403,553, and those to G. Britain to £58,135. This difference arises from the largest proportion of the products of the island being the property of the government, and being managed, stored, shipped (exclusively in Dutch ships), and sold in Holland by the Netherlands Trading Company, whose profits arise from the commission allowed on whose profits arise from the commission affords of British the transactions. In 1866, the exports of British home-produce to £, amounted to £1,726,136, but in 1867 had fallen to £1,345,413. The exports from Java to G. Britain, in 1866, amounted to only £8152, and in 1867, to £13,262-less than in 1864. The chief in 186., to 213,262—less than in 1894. The energe exports from J. to the U. States are coffee, sugar, rattan, pepper, and tin. The American ice and California flour trades are flourishing, and there exists a steady demand for several articles of American production. In 1867, the U. States exported to J. 8280 bbls. of flour, 4169 tons of ice, 121,830 galls. of petroleum. The imports to California were 676 tons of copper, 515 tons of sugar; and to the Atlantic ports, 173 tons of coffee, 1754 tons of sugar, and 129 tons of tin.
The island is divided into East, West, and Middle Java, containing 22 subdivisions, called Residencies. over which a superior European official, the Resident, exercises general control, and acts as judge, collector, and magistrate. The Resident has European assistants, who perform the same functions in districts of the residency, and native agency is also extensively employed in the government service, all the chiefs being either present or expectant salaried servants of the colonial government, actually engaged, under European superintendence, in ruling the masses. The chief native official of a district is the Regent, selected from the family of the former local prince, and retained in office so long as he promotes the interests of the government.

The material prosperity of J. is owing in a great measure to the energy with which the Dutch government has extended the growth and manufacture of those articles which form its staple exports. By an elaborate and skilfully worked out system of culture, introduced in 1830, the growth system of culture, introduced in 1830, the growth and preparation of the staples for exportation have advanced with amazing rapidity. The cultivators of the soil, the native chiefs, the European officials, and the government all share in the profits, and work harmoniously together in developing the capabilities of the land. In carrying out the extensive mercantile transactions which the culturesystem involved, the government has been ably assisted by the Netherlands Trading Company, and the result has been the changing a burdensome 1833, the expenditure exceeded the income. From that time, the finances of J. have been prosperous, and the colony has transmitted to the Netherlands, since 1838, a sum not short of £30,000,000 sterling, In thirty years, the revenue has risen from an average of £2,500,000 sterling, to £9,500,000 in 1857, in which year the net surplus was £3,500,000.

Climate.—With the exception of some marshy districts on the north coast, the climat of J. is healthy and pleasant. On the coasts, the thermometer seldom indicates more than 9.3° F. during the dry, and 84° in the rainy season. The average is 80° at noon, and 70° in the evening. The heat is moderated by the see-breezes, which constantly blow begins in November and the rainy season, which begins in November and the rainy season, which begins in November and the rainy season, which begins in November and the property of the season of the season when the north and east. Along the high lands of the interior the air is not only breezy, but sometimes cold, the thermometer frequently falling to 45°;

and as the entire island is intersected with excellent roads, it is not difficult to reach the most beautiful and salubrious districts. Inland of Semerang, at an elevation of 4000 feet, Europeans enjoy a pleasant

retreat during the dry season.

History.—The history of J., previous to the 14th c. is involved in fable and obscurity. It appears, however, that the Javanese, from a very early period, possessed a considerable degree of civilisation, which was probably the result of the labours of Brahmanical teachers from Hindustan. It is impossible to say precisely when Hindu civilisation and religion were introduced into J., though it must have been very early in the Christian era. Buddhism was superadded about the 10th c.; and there are many old Buddhist temples scattered throughout many on budding temples scattered throughout the island, memorials of the former prevalence of that religion. The most famous is that called Boro Buddor (q. v.). Towards the close of the 14th c., Mohammedanism found a footing in the eastern provinces; and in 1475, the Hindu empire was overthrown, and Mohammedanism became the faith of the country; yet as late as 1511, when the Portnguese first visited J., they found a Hindu king in Bantam. In 1595, the Dutch sent out an expedition under Houtman, who, on arriving at Bantam, found the king at war with the Portuguese, and offered him assistance, obtaining in return permission to build a factory. In 1677, after many contests with the native princes, the Dutch obtained extensive territories and important trading concessions. In 1811, when Holland became incorporated with France, the British took possession of J., which, after five years' occupation, was restored to the Dutch. A long and bloody war ended in the whole island becoming virtually a Dutch province in 1830, though two states are still nominally ruled by native princes. Slavery was abolished by a law which took effect Jan. 11, 1860, by the legislature of Holland.—See Sir Stamford Ruffles's History of Java; Crawford's Eastern Archipelago; Java, or How to Minage a Colony, by J. W. B. Money, Lond., 1861; A. Bickmore, E. I. Archipelago, Lond., 1868; W. B. d'Almeida, Life in Java, Lond., 1864.

JA'VELIN, a short and light spear used for darting against an enemy. In the Roman legion, the first and second lines (the Hastati and the Principes) were both armed with two javelins to each man. Each javelin (Lat. pilum) was in all about 6% feet in length; the shaft 45 feet long, of tough wood, an inch in diameter; and the remainder given to the barbed pyramidal head. In action, the legionary hurled one javelin on the enemy at the first onset; the second he retained as a defence against cavalry. The Goths and other barbarians used a javelin.

JAXA'RTES, now called SHRUN, or SIR-DARIA (i. e., Yellow River), a river of Turkestan, which rises in the high plateau south of Lake Issikul, in the Thian Shan Mountains, flows in a westerly direction through the valley of Khokan, receiving in its course numerous accessions; after passing Otrar, it divides into two branches; the largest and most northerly retaining the name Sir-Daria, flows west-by-north, separating the Russian territory from the steppes of Turkestan, and, after a course of 1150 miles, falls into the Sea of Aral; the lesser branch, called Kuvan-Daria, flows westward, supplying some small lakes in the line of its old channel, but for several years back has not reached the Sea of Aral, though sixty years ago it had a greater volume of water than the Sir-Daria.

JAY, JOHN, an American statesman and jurist, and first chief-justice of the supreme court of the

December 12, 1745. He graduated at King's, now Columbia College, New York, in 1764, and was admitted to the bar in 1768. He took a moderate and conciliatory part in the American Revolution, was a member of the Congress of Philadelphia, was president of Congress in 1778, and minister to Spain in 1779. He was very influential in negotiating the treaty of peace, and it was, according to Lord St Helens, 'not only chiefly, but wholly by his means that it was brought to a successful conclusion.' He wrote a portion of the Federalist. His services to the Federal party were deemed so great, that Washington offered him his choice of the offices in his gift, and he selected that of chief-justice. He resigned, and became governor of New York, and in 1794, minister to England, and was accused by the Democratic party of having sold his country to England against France. On the defeat of the Federal party, he retired from public life, and lived in great seclusion, only taking part in religious, peace, temperance, and anti-slavery movements. He died at Bedford, New York, May 17, 1829.

JAY (Garrulus), a genus of the Crow family (Corvidæ), differing from magpies chiefly in the rather shorter bill, and in the shorter and rounded, or sometimes almost even tail. They are inhabitants of forests and wooded districts, chiefly in the temperate parts of Europe, Asia, and North America; and feed more on fruits and seeds than crows and magpies generally do; but they have the omnivorous character of the rest of the family, and often rob the nests of other birds, whether and often for the nests of other birds, whether containing eggs or young.—The EUROPEAN J. (G. glandarius) is a well-known native of England and of the south and middle of Scotland, although less common than it once was, in consequence of the incessant war which has been waged against it, both by gamekeepers and by the legislature itself; an English statute of the 17th year of George IL. having empowered grand juries to offer threepence

European Jay (Garrulus glandarius).

for the head of each jay, on account of alleged injury done to young trees. It is rather smaller than a jackdaw; the plumage is mostly ash-gray, finely tinged with red or purple, the quill-feathers and tail mostly black, a beautiful mottled patch on each wing rayed with bright blue, a broad moustachelike stripe of black extending for an inch from the base of the lower mandible on each side; the head is furnished with a crest of erectile feathers, each of which has a streak of black in the middle. Jays are most frequently seen solitary or in pairs. They build in thick trees or bushes, and their nest United States, was born in the city of New York, is a basket-like structure of small sticks, lined

with fine roots and crasses; the eggs, five or six in number, are yellowish-white, minutely and thickly speckled with light brown. When taken young, the J. is very easily tained, becomes very familiar and amusing, and perhaps excels all other British birds in its power of imitating voices and sounds. The BLUE J. (Cyanura cristata) of N. America, a species abundant from the Gulf of Mexico to Canada, is smaller than the Common J.: it has a similar crest or tuft on the head, and a longer and more rounded tail. The general colour of the upper parts is bright purplish blue; the wings and tail white, barred with black; the neck surrounded with a curved black collar. It is more gregarious than the common J., and partially migratory.—The CANADA J., or CARRION BIRD (Perisoreus Canadensis), is a more northern American species.-Other very beautiful species are found in the north-west of America, Mexico, and the Himalaya Mountains. They generally resemble the Common J. in their

JAYADEVA, the name of a celebrated Hindu poet, who, according to some lived about the middle of the 11th, according to others, about the middle of the 16th c. after Christ. His most renowned work is the Glogowinds, an erotic poem in honour of Krishna, an incarnation of Vishnu, and his wife Rabla; it is interpreted both in a literal and mystical sense.

JEDBURGH, an old town, and royal and parliamentary burgh of Scotland, capital of the county of Roslaugh, is beautifully situated on the county of Roslaugh, is beautifully situated on the Selkirk, and 40 miles south-east of Edinburgh. The meet interesting architectural feature of the town is the remains of the magnificent abbey of Austin Canons, founded by King David I. about 1130. Of this structure, the church (230 feet long) alone remains. The abbey was rifled and burned in 1628 by the Earl of Surrey, and again by the test of the site of an old castle in which Malcount the Maiden died, and William the Lion, Alexander II., and other carry Scottish kings frequently resided. The principal manufactures of J. are blankets.

Jødburgh appears in record as early as the 9th century. Between the years \$29 and \$54, Egered, Bishop of Lindisfarne, whose diocese then extended to the north of the Tweed, built two towns at Jødburgh. One of these is now represented by the hamitet of 10d Jødburgh, the other by the town of Jødburgh, which was made a royal burgh in the reign of David L. Stutated on the border, its inhabitants were a warlike rase, whose slogan, 'Jøddart's here!' was seldom long silent. Their chief weapon was the 'Jødburgh axe,' or 'Jødburgh tantif', a stout pole about four feet long with a steel

JE'DDAH. See JIDDAIL

JEEJEBHOY, Str JAMSETIEE, a Parsee mechant-prince and philanthepoint, was born of poor parents at Bombay, 15th July 1783. At an early period, be shewed a great aptitude for mercantile pursuits, and in consequence, his father-in-law, Framjee Nusserwanjee, a Bombay merchant, took him into partnership. While still a young man, he visited most of the martime countries of Asia, besides Egypt, Syria, and England. After he had become chief partner in his father-in-laws firm, the wealth of which rapidly and prodigiously increased, J kept his eye on the progress of political events in Europe; and when peace was restored there after the fall of Napleon, the Indian trade was so much

benefited that, from 1814 to 1819, the value of the imports from Europe rose from £870,000 to £3,052,000-in which increase, we are informed, enormously participated. By the year 1820, when he had completed his 20th year of business, he had amassed an immense fortune, and was universally acknowledged to be the first merchant in the East. He now began to exhibit, on a magnificent scale, his liberality of spirit and love of his fellew-creatures. His contribution to the Jamsetjee Jeejeebhoy Hospital was 160,500 rupees; his endowment of the Parsee Benevolent Institution, 440,000 rupees; the Mahim Causeway, built by him, cost 150,500 rupees; the Dhurumsalla, or Poor Asylum, 150,000 rupees ; 180,000 rapees; and the endowment of the Jamsetjee School of Industrial Arts, 100,000 rupecs. Altogether, between the years 1822 and 1858, Sir Jamsetjee J. spent 'upwards of a quarter of a million pounds sterling in founding, endowing, or supporting undertakings of a purely henevolent character, Parsee and Christian, Hindu and Mussulman, were alike the objects of his splendid and magnanimous beneficence. At length the fame of his munificence reached the ears of Queen Victoria, who conferred on him the honour of knighthood-the first occasion on which that dignity had been bestowed on an Eastern. Other honours followed; and in 1857 he was made a baronet of the United Kingdom. He died 15th April 1859, and was succeeded in the baronetey by his eldest son, Cursetiee Jamsetiee Jeejeebhoy, who, in accordance with the provisions of his father's will, took his father's name.

JEFFERSON, THOMAS, third President of the United States of America, was the son of a planter, and was born at Shadwell, Albemarle County, Virginia, April 2, 1743. He studied at William and Mary's College, Williamsburg; and after leaving college, was engaged for some years in the practice of law. In 1769, he was elected to the Virginia House of Burgesses, where he joined zealously with the revolutionary party. In 1773, as a member of the Assembly, he took a prominent part in the measures which resulted in the calling of the Continental Congress, to which he was sent as a delegate, where he drew up the celebrated Declaration of Independence. During the war in defence of this Declaration, he was governor of Virginia, and in 1784 was sent minister to France, where his manners, accomplishments, and more solid qualities did much to secure to America the powerful alliance that insured her success. Returning in 1789, he was appointed, by Washington, Secretary of State, a post due to his abilities, his influence, and his distinguished services. The Federal constitution had been adopted, and the two parties which soon divided the country began to develop themselves. Washington, John Adams, Jay, and Hamilton were in favour of a strong centralised government; J. led the party in favour of states' rights, and a Federal government of restricted and carefully defined powers, The first party took the name of Federalists; the latter were first called Anti-Federals, then Republicans, and finally adopted the title first given them as a reproach, of Democrats. When Washington retired, after eight years of office as president, and a new election took place, the two highest John Adams and Jefferson. Adams, having the largest vote, was declared president, while J. having the next highest number, became the vice-president, 1797. The strife of these parties culminated in 1800, when J. and Aaron Burr were elected president and vice-president, against John Adams, the Federal candidate. On entering upon the presidency, ho

reduced the government to a republican simplicity, made few removals, and resolutely refused to appoint any of his own relatives to office, saying that he own connections. The most important act of his own connections. The most important act of his administration was the purchase of Louisiana from France. At the end of eight years, he retired to his residence at Monticello; but he did not retire to a repose of idleness; he kept up an immense correspondence, dispensed the hospitalities of his mansion to visitors from every part of the world, and founded the university of Virginia, of which he was for many years the rector. Though born and educated in the first rank of colonial life, he was a democrat in theory and practice; he held that the 'world is governed too much,' and that 'that government is best which governs least.' Though a large slaveholder, he laboured for the prohibition of the slavetrade, and of slavery in the territory beyond the Ohio River, and advocated emancipation in Virginia. His writings consist mostly of state papers and letters. His only literary work was his Notes on Virginia, published in 1782. He had one child, a daughter, and has numerous descendants. His death was very remarkable; it occurred on the 4th of July 1826, while the nation was celebrating the fiftieth anniversary of the Declaration of Inde-pendence, which he had written. On the same day, and almost at the same hour, John Adams, the second president, who had signed with him the Declaration, died in New England.

JEFFERSON CITY, capital of Missouri, United States of America, on the south bank of the Missouri River, 125 miles from St Louis, with which it is connected both by the river and the which it is connected both by the river and see Pacific Railway. It has a brisk trade with the hunters, and overland emigrants to California and Utah. The city has a state-house, governor's residence, state penitentiary, &c. Pop. in 1860, 2500.

JEFFREY, Francis, LORD, a celebrated Scottish critic and lawyer, was born in Edinburgh, 23d October 1773; studied classics, logic, and belles-lettres at Glasgow and Oxford, and law at the university of his native city. In 1794, he was called to the bar. Two years before this, he had become a member of the Speculative Society (in connection with the university). J. soon became prominent among the members by the keenness and liveliness of his intellect, and the elegance of his literary taste, but his progress at the bar was slow, partly on account of the antipathy which then existed to literary lawyers, and partly on account of his political opinions. Meanwhile he and several other young men then residing in Edinburgh, ambitious of finding a wider outlet for their talent than the of maning a whose outer for their raisent man the discussions in the Speculative Society or the practice of the bar afforded, conceived the idea of starting a critical journal. The first proposer of the scheme was the Rev. Sydney Smith. The result was the establishment of the Edinburgh Review (q. v.), of which J. became editor, an office he retained till 1829. His own contributions were generally the most brilliant and attractive that appeared in its columns. On ethics, politics, and many of the ques-tions affecting the social wellbeing of man, he has written with much clearness, penetration, and force; but the thing on which he is said to have placed the highest value was his Treatise on Beauty (see ESTHETICS), a charming melange of criticism, des-cription, and sentiment, but of doubtful philosophic worth. After some years, J.'s practice at the bar worth. After some years, or practice at the out began to increase; in jury trials, he shone to great advantage, and particularly in the trials for solution between 1817 and 1822. In 1830, he became Lord of Russia, in the government of Tambov, is situated Advocate for Scotland; and after the passing of 158 miles north of the town of that mane, on the

the Reform Bill, he was returned to parliament for the city of Edinburgh, which he continued to represent till 1834, when he gladly exchanged the turmoil of party politics for the duties of a judge of the Court of Session. During the latter years of his life, J. resided at Craigcrook Castle, in the vicinity of Edinburgh, where he died, January 26, 1850. of Leminury, where he due to distinct the control of the Sasys, in 4 vols., appeared in 1844. A biography of J., by his friend, Henry, Lord Cockburn (q. v.), a brother-judge of the Court of Session, was published in 2 vols. (Edin. 1852).

JEHO'VAH (Heb. Yehovah; more correctly, Yahve, Yahaveh, or Yahavah; in poetry, Yah; generally believed to be derived from the verb haya, to be,' though scholars are far from unanimous in 'to be, though sendles are for from the amnotes in regard to its etymology) is one of the names of God employed in the Old Testament. Its meaning—if the root be haya—is, 'He that is,' 'the Being',' or, since the word contains all the forms of the past, present, and future tenses, 'the eternal One.' It is generally employed to express a different conception of the Deity from that which is contained in the word Elolim (q. v.). The latter appears to be the older term, in use before the Hebrews had attained a national existence, while Jehovah exclusively seems to denote the national God, supreme over all other deities, and who, under this name, had, according to Exodus vi. 3, not 'made himself known' to the patriarchs before the time of Moses. That J. is specifically the God of the Hebrews is clear from the fact, that the heathen deities never receive this name; they are always spoken of as Elohim. Moreover, the altars, the sacrifices, the festivals, the tabernacle, the temple, the priesthood, and the prophets, all belong emphatically to Jehovah. Gideon shouts, 'The sword of Jehovah and of Gideon,' as a Roman warrior would have invoked the aid of Jupiter. In one sense, the term J. is less broad and universal in its application than Elohim, who, in the first verse of the Bible, appears as the creator of heaven and earth, and who is God over all, irrespective of nations; but in another over all, irrespective of intains; bits in amounts sense, it clearly indicates an advance in religious conception. While Elohim is introduced more as an Almighty Creative Power than a 'Being,' J. is God in full personal relation to man—H₁, speaks to his creatures, makes covenants with them, becomes their lawgiver, and desires their homage and worship. The Hebrew writers even run their representations of the Divine personality into what seem to us the extremest forms of authropomorphism.

Deep reverence for the Deity and the Divine name has led the Jewish church to the substitution of Adonai (Lord) in the pronunciation of J., the latter being vowelled by the Masoreths like the

A very mice and difficult controversy with respect to the authorship and unity of the Pentateuch, has long been carried on among scholars in connection with these two names. See Genesis and PENTATEUCH.

JELALABA'D, a town of Afghanistan, stands near the Cabul, in a fertile plain, which is separated from Peshawur by the famous Khyber Pass. It thus occupies a commanding position on the grand route between India and Central Asia. Pop. about 3000. The place acquired an historical merest during the Afghan wars, having been heroically held by Sir Kobert Sale (1841–1842), notwith-standing the fatal disasters of the first expedition, till it was relieved by the triumphant advance of

left bank of the Oka. Woollen cloths, vitriol, and sulphur are here manufactured. Pop. 6600.

JELE'TZ, a town of Russia, in the government of Orel, is situated 110 miles east-south-east of the town of that name, on the Sosna. In the vicinity are extensive iron-mines, and the town has become famous for its wheaten flour, which is exported throughout the whole of Russia. Pop. 1863, 26,505.

JELLACHICH VON BUZIM, JOSEPH, BARON, a distinguished Austrian general, and Ban of Croatia, was born at Peterwardein in 1801. His father, the descendant of an old Croatian family, was a general in the Austrian service, and attained some celebrity in the Turkish wars, and in those of the French Revolution. Von Jeffachieh was early employed in military service on the Turkish frontier, and distinguished himself by his courage and skill. He succeeded also in winning in a high degree the confidence of the Croations, so that in 1848 the court of Vienna was what to appoint him Ban of Crontia, in order to secure the support of the Slavonian Croatians against the Magyars of Hungary, and he took a very active part in the suppression of the Hungarian rebellion. He not only displayed talents for government and military command, but also for poetry. His poems were published in 1850, and his death occurred in

JE'LUM. See JHELUM.

JEMA'PPES, a village (pop. about 6000) not far from Mons, in the Belgian province of Hainault, which has acquired an historic celebrity from the victory won here by the French republicans, 40,000 strong, under Dumouriez, on 6th November 1792. over the Austrians, who were in nearly equal force. By this victory, the way into Belgium was opened to the French, and the spirits of the army and of the people greatly elevated by the first great victory of their raw levies over the disciplined and experienced Austrian troops.

JE'NA, a town in the grand duchy of Saxe-Weimar-Eisenach, and formerly the capital of the duchy of Saxe-Jena, is most beautifully situated in a romantic valley at the confluence of the Leutra with the Saale. Pop. 6984. It derives its celebrity chiefly from its university, but also from the great battle fought here between the French and the Prussians.—The University of Jena was founded about the year 1547 by the Elector John Frederick of Saxony, who intended it to supply the place of Wittenberg as a seat of learning and of evangelical doctrine. It soon acquired a high repuafter some delay and difficulty, in 1558. It is the university of all the Saxon states, and is supported by contributions from them all. Its revenues amount to 40,000 thalers (£5793 sterling). The most flourishing period of the university was that of Duke Karl August, a zealous patron of art and science, 1787-1806 A.D. To have obtained academie honours in J. is no small recommendation to employment in other German universities, and universities have been students of this. Some of its professors were among the first and most successful supporters of the philosophy of Kant. Fichte founded a new school of philosophy here in 1794, and the names of Schelling and Hegel are also connected with Jena. The brothers Schlegel, Voss, Fries, Krause, and Oken, have added to its celebrity in literature and science. The faculty of medicine, as well as those of theology and law, eminent theologians, however, have been of the most extreme rationalistic school; the name of Paulus may be mentioned as a sufficient example, different sorts of disease which attacked the milkers

In 1855, the number of professors and teachers was 67: of students, 380: and there are about 24 ordinary

The great battle of Jena was fought in the neighbonrhood of the town on 14th October, 1806. The Prussian army, numbering about 70,000 men, was under the command of the aged Duke of Brunswick; while the French, commanded by Napoleon, amounted to 90,000. The former were completely defeated. On the same day with the buttle of Jena, Davonst won the battle of Auerstädt, with 30,000 French defeating 60,000 Prussians, and these two battles decided for a number of years the fate of the Prussian kingdom and of the north of Germany. The loss of the Prussians on that eventful day and in the conflicts of the preceding days amounted to 50,000 killed, wounded, and prisoners, besides the loss sustained by the Saxons, their allies. The French gave out their loss to be 7000, including 270 officers.

JENNER, EDWARD, the discoverer of vaccination, was born at Berkeley, in Gloucestershire, on the 17th of May 1749, and was the third son of the Rev. Stephen Jeuner, vicar of the parish, and rector of Rockhampton. His scholastic education being finished, he was removed to Sodbury, near Bristol, in order to be instructed in the elements of surgery and pharmacy by Mr Ludlow, an eminent surgeon there; and on the expiration of his term with this gentleman, he went to London, in the 21st year of his age, to prosecute his professional studies under the direction and instruction of the celebrated John Hunter (q. v.), in whose family he resided for two years. Under Hunter's superintendence, he became an expert anatomist, a sound pathologist, a careful experimenter, and a good naturalist. The influence of the master exerted a lasting effect on the pupil; and Hunter's letters, which J. carefully preserved, evince the affectionate feeling and community of tastes which subsisted between them. On leaving London, J. settled at Berkeley, where his sound professional knewledge and kindly disposition soon acquired for him a large amount of practice. In 1788, his well-known memoir, On the Natural History of the Cuckoo, appeared in the Transactions of the Royal Society, containing the results of investigations begun at the request of Hunter. A few tigations began at the request of Idates. A rew years afterwards, the fatigues of general practice having become irksome to him, he resolved to confine himself to medicine, and with that view he obtained the degree of M.D. from the university of

The discovery of the prophylactic power of vaccination, by which the name of J. has become immortalised, was the result of a prolonged series of observations and experiments. His attention, whilst he was yet a youth, was forcibly attracted to the nature of eow-pex in the following manner. He was pursuing his professional education in the house of his master at Sodbury, when a young country-woman came to seek advice. The subject of small-pox being mentioned in her presence, she observed : 'I cannot take that disease, for I have had cow-pox.' This was before the year 1770. It was not till 1775 that, after his return to Gloucestershire, he had an opportunity of examining into the truth of the traditions respecting cow-pox; and it was five years later before he began clearly to see his way to the great discovery that was in store for him. In the month of May 1780, while riding with his friend Edward Gardner, on the road between Gloucester and Bristol, 'he went over the natural history of cow-pox; stated his opinion as to the origin of this affection from the heel of the horse [when suffering from the grease]; specified the when they handled infected cows; dwelt upon that variety which afforded protection against small-pox; and with deep and anxious emotion, mentioned his hope of being able to propagate that variety from one human being to another, till he had disseminated the practice all over the globe, to the total extinction of small-pox.'-Baron's Life of Jenner, p. 128. Many investigations regarding the different varieties many investigations regarding the attent varieties of cow-pox, &c., delayed the actual discovery for no less than 16 years, when at length the crowning experiment on James Phipps (see Inocultation) was made on the 14th of May 1796, and J.'s task was virtually accomplished. This experiment was followed by many of the same kind; and in 1798 he published his first memoir, entitled An Inquiry into the Causes and Effects of the Variola Vaccina. Although the evidence accumulated by J. seemed Atthough the evidence accumulated by 3. seemed conclusive, yet the practice met with violent opposition until a year had passed, when upwards of 70 of the principal physicians and surgeons in London signed a declaration of their entire confidence in it. His discovery was soon promulgated throughout the civilised world. Honours were conferred upon him counsed word. Honours were conterred upon film by foreign courts, and he was elected an honorary member of nearly all the learned societies of Europe. Parliament voted him, in 1802, a grant of £10,000, and in 1807, a second grant of £20,000; and during the last few years, a public statue in his honour has been erected in the metropolis. His latter days were passed chiefly at Berkeley and Cheltenham, and were occupied in the dissemination and elucidation of his great discovery. He died of apoplexy at Berkeley in February 1823.

JERA'SH. See GERASA.

JE'RBA. See GERBL

JERBOA (Dinus), a genus of rodent quadrupeds, of the family Muridar, remarkable for the great length of the hind-legs, and kangaroo-like power of jumping. The fore-legs are very small, hence the ancient Greek name dipons (two-footed). The tail is oling, cylindrical, overed with short hair, and tufted at the end. The jerboas are inhabitants of sandy deserts and wide grassy plains in Asia and the east of Europe, Africa, and Australia. They are burrowing animals, noturnal, very destructive to grain and

Jerboa (Dipus Ægyptius).

other crops, laying an boards for their winter use. They take prodigious leaps when alarmed; the ritise. Hitzig numbers 34, which he believes to be fore-fect are then not used at all, but by means of the bind-fect and the tail, they leap, although of the composition of Jeremiah. There is no reason to the small suinals, several yards. Their flesh is said to resemble that of the rabbit—Closely laided to the jerboas are the Gerbits (Gerbittas), almost by Jerome (Math. 27), descrees little notice, almost quality of the production of the problem of the probl

of hind-legs and power of leaping, inhabitants of the warm and sandy portions of the Old World.

JEREMI'AH (Heb. Yirmiyahu), a Hebrew prophet, was the son of Hilkiah, a priest of Anathoth, a place about three miles north of Jerusalem. He a place about three miles north of Jerusalem. He prophesical under the reigns of Josiah, Jehonakaz, Jehonakim, weak kings, its speedy destruction. Fearless yet hopeless, he delivers his mournful messages from year to year, and battles with despairing heroism against the inevitable. His life thus became one long martyrdom. We read of his enduring 'reproach and derision daily' (xx. 8); his townsmen reprosen and derison daily (xx. 8); his townsmen of Anathoth threatened to slay him, if he did not stop prophesying woe (xi. 21); his own brethren, the house of his father, 'dealt treacherously' with him (xii. 6); so that his spirit at times failed him. mm (xn. 0); so that his spire at times latted film. There were two political parties in Judah at this time—in favour of a Chaldean and an Egyptian alliance respectively. Like the earlier patriotic prophets, J. repudiated both at first. The course of events, however, had necessitated a compromise, and the religious party—gradually decreasing in numbers and influence—had declared against Egypt, and in favour of Chaldea. King Josiah, who belonged to it, perished at Megiddo, in the valley of Esdraelon, in an attempt to stop the progress of Pharaoh-Necho (609 B.C.). After this, things grew worse. The Egyptian party became predominant, and J. was now forced to take a side, and become a partisan as well as a prophet. He speaks of the king of Babylon as God's servant, and prophesies the destruction of the temple. A cry arose from the destruction of the temple. A cry arose from the priesthood and the prophets for his life, and he escaped with difficulty (xxvi). At last came the pludgment. The best portion of the people were carried into captivity; and J. urged his country-men to wait for the period of deliverance with religious fortitude and patience. A sudden irrup-tion of the Egyptians drove the Chaldeans out of Judah, and J. was again exposed to persecution, thrown into a pit to die, and only rescued by the kindness of an Egyptian ennuch. The capture of Jerusalem by Nebuchadnezzar rendered the prophet's position more tolerable. J. had always preached submission to the Chaldmans. He was even patronised by the conqueror, and offered a home at Babylon, but he preferred to reside among the wretched remnant of the people left in Judah (xl.). Intestine strifes, however, soon drove some to take refuge in Egypt. J. was carried off along with the exiles, and here he is believed to have died, and his grave was long shewn at Cairo. According to others, however, he came back to Judæa. The writings of this prophet, dictated by him to Baruch, have been arranged with little regard to order, and the text is in a state of great confusion, notwith-standing that J. himself undertook two distinct redactions. They exhibit great tenderness and elegiac beauty of sentiment, but lack the sublime elegiac beauty of sentiment, but next the smilline grandeur of Isaiah. He often borrows largely from his poetic predecessors. Several of the Psalms have been attributed to him, especially by modern critics. Hitzig numbers 34, which he believes to be the composition of Jeremiah. There is no reason to doubt that the Lamentations are properly ascribed to him, while the apocryphal work of his, mentioned by Jerome (Matth. 27), deserves little notice. Michaelis, Umbreit, Henderson, Dahler, Knobel, religious fervour of his disposition, he retired, in Ewald, Hengstenberg, and Bunsen. 374, to the desert of Chalcis, where he spent four

JERICHO, once one of the most flourishing cities of Palestine, two hours' journey westward from the Jordan, and six hours north-east from Jerusalem. Westward from J. lies a waste tract of linestone mountains, rising in stages; but the immediate vicinity is well watered and Irritiful, jelding dates, raisins, balsam, and honcy, yet a favourite abode also, in early times, of poisonous snakes. The enptare of J. by the Israelites on their first entry into Cananan, its destruction, and the reduibling of it by Iliel the Bethelite in the reign of Ahah, about 1918 n. C., are found recorded in Josh. vi.; 1 Kings xvi. 34. It appears to have been afterwards the seat of a school of prophets (2 Kings is, 4, 8c.). Hereof the tirront resided in J., and beautified again rebuilt under Hodrian. In the time of the Crisonles, it was repeatedly captured, and at last completely destroyed. At the present day, its place is occupied by a miserable village called Richa, or Ericha, with Sarorely 200 inhubstants.

JERKED-BEEF, beef preserved by drying in the sun. It is properly called charqui, and, like its name, is of Chilian origin, although now made in large quantities in Monte Video, Buenos Ayres, and other places in South America, where the vast droves of cattle on the prairies are available for the purpose. The beasts are slaughtered when in good condition, and the fleshy parts are dexterously pared off in such a manner as to resemble a succes sien of skins being taken from the same animal. These sheets of flesh, which are rarely more than an inch in thickness, being exposed to the sun, dry before decomposition commences, and in that state can be kept almost any length of time. Semetimes the charqui is dipped into brine, or rubbed with salt, before being dried. It is largely imported to Cuba, where it is called tasajo, for feeding the slaves. The manufacture of charqui, or jerked-beef, has been introduced into Australia, and in 1862, shipments of it were made from Victoria to the mothercountry, but with what success is not known.

Jerkin-Head.

As it contains all the nutritive matter of animal food, and only wants proper cooking to make it palatable, it may become an important article of consumption. The price is about three-balfpence or twopence per nound.

JERKIN-HEAD, a form of roofing which is half-gable, half-hip. The gable generally goes as high as the ties of

as high as the ties of the couples, above which the roof is hipped off.

JEROME, Sr (EESERIES HIEROSYMES SOFIRMS, SITS), was shorn at Stridon, a town whose site is now unknown, on the contines of Dalmatia and l'aumonia, at some period between 331 and 345—probably nearer to the latter year. His parents were both Christians. His early education was superintended by his father, after which he studied Greek and Latin rhetoric and philosophy under Ælius Donatus at Rome, where he was also admitted to the rite of buptism. After a residence in Gard, 470, he had settled in Aquileia with his friend Rufinus. For some unknown reason, he suddenly were hence to the East; and after a dangerous illness at Autioch, which appears to have still further added to the

374, to the desert of Chalcis, where he spent four years in penitential exercises and in study, especially of the Hebrew language. In 379, he was ordained a priest at Antioch, after which he spent three years in Constantinople in close intimacy with Gregory of Nazianzus; and in 382 he came on a mission connected with the Meletian schism at Antioch (see MELETICS) to Rome, where he resided, until 385, as secretary of the pope Damasus, and where, although already engaged in his great work of the revision arreary engager in his great work of the revision of the Bible, he attained to great popularity and influence by his saucity, learning, and elequence. Many pious persons placed themselves under his spiritual direction, the most remarkable of whom were the Lady Paula, and her daughter Eustochium. These ladies followed him to the Holy Land, whither he returned in 384. He permanently fixed his residence at Bethlehem in 386, the Lady Paula having founded four convents, three for nuns, and one for monks, the latter of which was governed by J. himself. It was in this retreat that J. pursued or completed the great literary labours of his life; and it was from these solitudes, all peaceful as they might seem, that he sent forth the fiery and vehement invectives which marked net only his centroversy with the heretics Jovinian, Vigilantius, and the Pelagians (q. v.), but even with his ancient ally, Rufiaus (q. v.), and, although in a minor degree, with St Augustine. His conflict with the Pelagiaus rendering even his life insecure at Bethlehem, he was compelled to go into concealment for above two years; and soon after his return to Bethlehem in 418, he was seized with a lingering illness, which terminated in his death, September 30, 420. His original works, consisting of letters, treatises, polemical and ascetical, commentaries on Holy Scripture, and his version and revision of former versions of the Bible, were first published by Erasmus, 9 vols. felio (Basel, 1516), and have been several times reprinted. The best editions are that of the Benedictines, 5 vols. best cultains are that of the benderatines, 9 ones, folio (Paris, 1693—1706), and, still more, that of Vallarsi, 11 vols. (Verona, 1734—1742). St J. is universally regarded as the most learned and eloquent of the Latin Fathers. His commentaries on the Bible are especially valuable for the learning which they display; but his opinions are often exaggerated and fanciful, and through his controversial writings there runs a strain of violent invective, which centrasts unfavourably with the tone of

his contemporary St Augustine. See VULGATE. JEROME OF PRAGUE, the companion of John Huss, whom he surpassed in learning and elequence, though he was inferior in judgment and moderation, was born at Prague in the latter half of the 14th century. After attending the university of his native town, he continued his studies at Paris, Cologne, Oxford, and Heidelberg, and in 1399 took out his degree as Master of Arts and Bachelor of Theology. His reputation for learning was so great, that his advice was taken by Ladislas II., king of Peland, with respect to the founding of the university of Cracow in 1410; and Sigismund, king of Hungary, invited him to preach before him at Buda. He entered with his whole soul into the contest carried on by his friend Huss against the abuses of the hierarchy and the profligacy of the clergy. His zeal, however, carried him too far; he publicly trampled the relics under his feet, committed to prison the menks who did not share his opinions, and even ordered one of them to be thrown into the Moldau. When Huss was arrested at Constance, J. hastened to defend him; but receiving no satisfactory answer to a letter in which he had demanded a safe-conduct from the council, he set out on his return to Prague, when he was arrested at town is St Helier (q. v.). The small neat town Hirschau, in April 1415, by the orders of the Duke of Sulzbach, and conveyed in chains to Constance. Here he was cast into a dungeon, and placed on trial. After some months' imprisonment, he recanted his opinions, but subsequently abjured his recan-tation with horror, and went to the stake with great firmness. He was burned alive, 30th May 1416. J.'s life has been written by Heller (Tübingen, 1835) and by Becker (Nördlingen, 1858).

JERROLD, Douglas, dramatist, journalist, and miscellaneous writer, was born in London on the 3d January 1803. His early efforts in literature were directed to the theatre, and some of his pieces —Black-eyed Susan (1829), for instance—still hold possession of the stage. At a later period, he pro-duced several five-act comedies, the best known of which are Time Works Wonders, and The Bubbles of a Day. J.'s reputation stands more securely on his novels, sketches, and essays than on his dramatic works. His Men of Character was originally published in Blackwood. He joined the staff of Punch (1841), and contributed to that periodical A Story of a Feather, Punch's Letters to his Son, and the world-famous Caudle Lectures. Later appeared The Chronicles of Clovernook, the kindhest and most delightful of all his books, and St Giles and St James, his most elaborate novel. For several years before his death, he edited Lloyd's Weekly Newspaper. He died from disease of the heart, at Kilburn Priory,

at the age of 55. J. was a brilliant rather than a great man of letters. His plays are sparkling, but they want body and substance, and uninteresting matter had never perhaps so epigrammatic a setting as in his novels and tales. His reputation as a social wit novers and tages. His reputation as a social wit stands higher than his reputation as a writer. He was greater in society than in his closet. Like a flint, every stroke brought fire from him. See Life and Remains of Douglas Jerrold, and Douglas Jerrolds Wit and Humour; both by his son, William Blanchard Jerrold (Lond. 1859).

JE'RSEY-THE CHANNEL ISLANDS. is the chief of the group called the Channel Islands (q. v.). The other inhabited islands of this group are Guernsey, Alderney, Sark, Herm, and Jethou, and there are numerous uninhabited islets and rocks. The coast is very dangerous, but light-houses are placed on most of the island headlands, and on are placed of most of the Island Readinata, and of the dangerous rocks called the Casquets, west of Alderney, a triple light is exhibited. The Chaussey Islands belong to France. The following table exhibits the area and population of the principal islands:

	Acresco.	Aerengo	Population.		
Name of Island.	Acreages	Cultivated.	1851.	1861.	
Jersey,	39,580 15,560 2,500 1,700	25,000 10,000 1,500 600	57,020 29,733 3,833 581 480	56,078 29,780 4,933 600 230	

Physical Geography-Description.-J., which lies 17 miles south-west of Guernsey, and 16 miles from the coast of France, is of an oblong form, about 10 miles in length and 6 in width. The land is high on the north coast, and slopes to the south and east. It is intersected by several small streams. The coast is indented by large open bays on the west, south, and east; but on the north, by small rocky inlets. The interior is mostly table-land, well wooded, especially in the valleys along the winding streams. J. is divided into 12 parishes. The clurches have little architectural pretension, but five to treaty English acres. The principal cross are generally picturesquely situated. The principal are hay, wheat, turnips, potatoes, mangel-wurzel,

of St Aubin lies at the western extremity of the bay of that name. It possesses a diminutive harbour and eastle, a good grammar-school, and extensive vineries. Mont Orgueil Castle is a grand and imposing medieval fortress, looking over Gorey Harbour. Some parts of it are said to be of the time of Julius Cæsar. It was the prison of Prynne and the Parliamentariaus, and has been used as a barrack. A good view of the island may be obtained from Hougue Bie, or Prince's Tower, a building raised on a mound of legendary interest.

ALDERNEY and GUERNSEY are described elsewhere

(see those heads).

SARK (Sercq, Gers). Great and Little Sark are one island, connected by a natural causeway called the Coupée. They are lofty table-lands, with precipitous sides. The total length of the islands and rocks is about five miles; the greatest width, including Brechou and the Burons, about three miles. Sark is eight miles from Guernsey. The principal objects of interest are the pierced rocks, principal objects of interest are the piercea rocks, caverns, and fissures. The caves are very rich in zoophytes. The seigneur is the Rev. W. Collings, who resides on the island. There is one parish church, and a lodging-house for visitors, &c. coast is very difficult of access, the only entrance to the interior being through a creux or tunnel cut in the rock.

Geology .- Most of the islands are composed of primary or granitic rocks. Alderney is a mass of syenite, with hornblende, porphyry, and occasional sandstone. The structure of Guernsey is hard syenite to the north, and gneiss to the south. The geology of Jersey is more varied, presenting a mixture of metamorphic rocks, conglomerates, and sandstones, with syenites and quartzites. Shale and blown sand are also prevalent. Sark is composed of very hard syenite, with veins of greenstone and felspar. Granite is quarried from all the islands, especially from Guernsey, Herm, and Mount Mado in Jersey, both for home use and exportation.

The scenery of the Channel Islands is exquisitely

varied and beautiful; probably in no other area of similar size could be found such a combination of

savage rocks and pleasing landscapes.

The climate of the Channel Islands is agreeable and suitable to invalids. The prevailing winds are from north and north-west. The mean annual rainfall is 35 inches in Guernsey; but the climate is not overmoist, the soil being porous and evaporation rapid. The mean annual temperature of Jersey is 50°8; of Guernsey, 51°5, or 2°5 warmer than Greenwich. The range of temperature is very than creenwish. The range of temperature is very moderate; but the climate of Guerney is rather more equable than that of Jersey. August is the hottest montly February, the coldest. Frost and snow are rare. The autumns are very beautiful; and a second summer, colled the Petit Ett & Saint Martin, generally sets in about the 10th of October, and last still the width of December. Blowering and lasts till the middle of December. Flowering plants and shrubs are a fortnight earlier in the spring than in England.

The produce of the islands is principally agricultural; but harticulture and floriculture are successfully followed—the latter especially in Guernsey. The soil is generally light, deep, and fertile. The system of cultivation is very primitive. The principal manure is sea-weed, which is gathered in vast quantities from the shores, at certain seasons, under strict regulations. Its annual value to Guernsey

strict regulatous. Its annual value to destruct alone is estimated at £30,000. A great quantity is burned for the manufacture of kelp and iodine. The land is held in small parcels ranging from five to twenty English acres. The principal crops

parsuips, and carrots. The yield of wheat is upwards of 30 bushels to the acre—the average of England being 24. The Channel Islands possess an excellent breed of horned cattle, usually known as Alderneys, remarkable for their small size and as Anterietys, remarkable for first shall she and symmetry, and for the quantity and quality of the milk which they yield. A large number of choice cows from the island of Jersey have been recently imported into the U. States. Fruit is much cultivated in Jersey, especially the vine, and the peach, apricot, plum, apple; and the pear, partiularly the Chanmontel, attains extraordinary size and llavour in Guernsey, About 30,000 bushels of table-fruit are annually exported from the islands to London and Paris. Shrubs and flowers flourish abundantly. The Acclimatisation Society of London receive favourable accounts from the Guernsey branch of the successful cultivation of the Brazilian arum, for the manufacture of arrow-root, the produce being and the cow-cabbage grows to the height of ten or twelve feet. The other products of the islands are principally fish, viz., turbot, red mullet, John Dory, conger, Laugous or sand-eels, also lobsters and ovsters, large quantities of which are exported. A considerable traffic is carried on in granite from all the islands; the blue granite from Guernsey for macadamising, and the pink syenite from Mount Mado, in Jersey, for paving purposes, are highly esteemed, and largely imported into London. In 1861, 731 vessels left the harbour of St Sampson

in Guernsey, carrying 142,505 tons of stone.

History.—The early history of the Channel Islands is mythical and lecendary; but it is probable that the carliest inhabitants were Bretons. The islands were under Roman occupation during the 3d and 4th centuries, the name of Cessarea or Jersey (Cessar's Isle) occurring in the Itinerary of the Antonines. Christianity was probably introduced by missionaries from Ireland alout 460 A.D.—St Helerius being the traditional apostic of Jersey, and St Sampson of Guernsey. Probably a mixed pepulation of Saxons, Danes. Goths, and Gauls betook themselves to these islands during succeeding centuries, as the Franks possessed the continent. The islands were taken possession of by Roll Technologies, and the standard of the Rollogies of the Saxons of Saxons Andread, and Rollogies and Saxons and Saxons of the Rollogies and Saxons of Saxons, Danes, and Rollogies and Saxons of Saxons, Danes, and Rollogies and Saxons of Saxons of Saxons, Danes, and Rollogies and Saxons of Saxons of Saxons, Danes, and Rollogies and Saxons of Saxons, Danes, and Rollogies and Saxons of Saxons, Danes, and Gauls and Rollogies and Saxons of Saxons, Danes, and Gauls and Saxons of Saxons, Danes, and Gauls Lander Millians, and Saxons of Saxons, Danes, and Gauls and Saxons of Saxons, Danes, and Saxons of Saxons, Danes, and Saxons, Danes, Control of Saxons, Danes, Canton of Saxons, Danes, Control of Saxons, Danes, Danes, Danes,

remained faithful to England. John is said to have given a constitution to Guernsey. The islands still belonged ecclesiastically to Normandy, the Bishop of Contances being their diocesan. Edward III. and Henry V. materially weakened the papal bond; but it was not wholly severed till the Reformation, after which (in 1658) they were attached to the see of Winchester. In Henry VI.'s time, the French held Jersey for six years. During the civil war, Jersey was loyal and Episcopal; Guernsey, republican and Presbyterian; and traces of this divergence are still to be found. In 1781, during the first American war, a French expedition, under the Baron de Rullecourt, landed in Gronville Bay, and marched into the marketplace of St Helier, but was repulsed with loss by the garrison and militia. During the French and American wars, the islanders fitted out many privateers, and obtained rich prizes. Smuggling was finally suppressed in 1800. Since the peace, the Channel Islands have thriven and prospered by com-merce and agriculture, and especially by becoming the resort of numerous families from England, who have been attracted thither by the beauty of the scenery or the salubrity of the climate.

Automities.—Formerly, there were many cromleclas in the islands; the largest remaining are those near Ment Orguell in Jersey, and at L'Aperesse Bay in Guernsey. A few old chapels of Norman architecture remain. The deliest church in Jersey is that of St Brelade, said to have been built in 1111.

Leaguage—The vernacular language of the islands is the old Norman French. It retains its peculiartities of spelling and pronunciation in Guernsey more than in Jersey, where the French, and in Aldemey, where the English clement predominates in the dialect. French, however, is the language used in the law-courts of all the islands; but English autions English. The church services are performed in French in the country parishes, but an English service takes place in most of the lown churches.

Inhabituats.—The proportion of strangers in Jersey is very large, British being about 13,000, French 20:00; the native population about 41,000, mearly all of whom live in the country. The natives are generally fragal and independent. Society is much divided into cliques; the 'sixties' and 'forties' in Guernsey are a marked division.

disconnect and Larse.—Though belonging to the British crown, the islands have a certain independent sotates and action. The principal officer in cash island is the licutenum-pooraror, who is a general officer in the army, and supreme in all unlittary matters; but he has also certain civil and numicipal duties. In Jersey especially, his civil jurisdiction is very extensive. He continues in office free years.

The batify or judge is the first civil officer in cach island. He is also appointed by the crown, generally for life. He presides at the royal court, and has a casting vote in civil and criminal cases. He originates all measures proposed to the states, and represents the crown in all civil matters. The jurats are twelve in number, elected in Jersey by suffrage of rateapyers, for life. They six in all the courts, and have a voice in all deliberations: in Germey, they are elected by the elective states. The rectors of the different parishes have also a seat in all countils: in Germey, those eventually the courts, are an atterney and a solicitor general in cach island, and a high-sheriff, called in Jersey the vicouste, and in Germey, the pressy. The court is and and high-sheriff, called in Jersey the vicouste, and in Germey, the 't states' to assemblies

The other members of the 'states' or assemblies are, in Jersey, the contables of the 12 partiabes and the 14 deputies of the ringteniers, who are elected from the ninguines of each parish. The regul court on each island consists of the bailiff and jurats. The 'states', not convenable without the consent of the governor, pass ordonances, which are in force for three years; laws intended to be permanent must be submitted to the sovereign. The lieutenative procurance are not on all questions deliberated.

In Guernscy, the 'Deliberative States' consist nearly of the same body, but there are also the 'Elective States', a more popular assembly, amounting to 229 persons—the great majority being 200 dontamiers, elected by the ratepayers of the various parishes. The donzaniers (originally 12 from each parish) are the managers of all parish matters, and elected for tile. The bailiff presides. The lieuteant-governor has no veto, and orlonances passed take effect without the royal approbation. The proceedings of the states relate to the internal administration of the island.

Alderney and Sark, though possessing courts of their own, and jurisdiction in petty offences, are,

639

with the smaller adjacent islands, under the baili- by the name of the 'City of David,' transporting

wick of Guerusey.

The laws of the islands are very peculiar, being mainly derived from the ancient customary law of Normandy. The laws relating to property are singular: arrest takes place in Jersey without proof or affidavit. Until recently, the Queen's writ had no power in the islands, and the Act of Habeas Corpus has only lately been admitted. Encroachments on property are sometimes met by a curious appeal called Ha! Ro! à l'aide, mon Prince! repeated thrice. It is considered to be the remains of an old appeal to Rollo, Duke of Normandy, and is still a valid form of injunction.

Ecclesiastical State.-There is a dean in each island. The livings are in the gift of the crown, and of small value. The principal educational establishments are Victoria College in Jersey, and Elizabeth College in Guernsey. In both, a first-class education is given on very moderate terms, by an excellent staff of teachers, and they have various exhibitions at the universities of Oxford and Cambridge

There is regular steam-communication between England and the Channel Islands, also between Jersey and the French ports of Granville and St Malo; and in summer there is generally an excur-sion-boat once a week to Sark and Herm.

sion-boat once a week to Sark and Herm.

The islands are protected by numerous forts, especially about the harbour of refuge in Alderney.

Books of Reference.—The principal historical authorities are the Rev. P. Falle's History of Jersey; Mr Duncan's and Mr F. B. Tupper's Histories of Guerney; and Mr Dally for the agriculture of the islands. The most recent and comprehensive work is The Channel Islands, by D. T. Ansted, M.A., F.R.S., and R. C. Latham, M.A., M.D., F.R.S., &c. (Loud. 1862).

JERSEY CITY, a city in New Jersey, United States of America, the west bank of the Hudson Kiver, opposite New York, of which it is, in fact, though in another state, an extension, and to which it is united by large and powerful steam for the state of the state of the state of the another which is a state of the state of the state and the townique of the New York and Philadelphis. and the terminus of the New York and Philadelphia, Erie, Easton, Morris and Essex, and Northern Railways, and of a canal for coal-transport. It has manufactories of locomotives, machinery, glass, crucibles, &c.; and about twenty churches, the finest of which once stood in Wall Street, New York, but was removed, and built np. stone by stone, in this city. Pop. in 1850, 11,473; in 1860,

JERU'SALEM (Heb. Yerushalem, Gr. Hierous-JERU SAIDER (Heb., Francisco), Arabic El-alem, Lat. Hierosolyma; called also in Arabic El-Khuds or El-Kods, 'the Holy'), the Jewish capital of Palestine. Its origin and early history are very obscure. Josephus (Antiq. i. x. 2) identifies it with the 'Salem' of which Melchizedek (Gen. xiv. 18) is called king; but St Jerome doubts the correctness of this view. Critics are better agreed as to the identity of J. with Jebusi, the city of the Jebusites (Josh. xviii. 28), and we know that the Jebusites retained possession of the strong positions of the hill of Zion for a considerable time after the conquest of Canaan, and even after the storming of J. (Ind. i. 8), while the tribes of Judah and Benjamin occupied the the times or Judan and Deujamin occupied and lower city. They were finally disposessed by David (2 Kings v. 7). The name J. is first mentioned in Joshua x. I. It lies upon the original border of Judah and Benjamin, the line of which runs through the valley of Hinnom; so that Zion and

to it the ark of the covenant, and building in it an altar to the Lord, on the place of the apparition of the angel by which the plague was stayed (2 Kings xxiv. 25). The building of the temple under Solomon was the consummation of the dignity and holiness of J., which was further enlarged, strengthened, and beautified by this king and by his successors. It suffered a diminution of political importance through the revolt and secession of the Ten Tribes, from which date its history is identified with that of the kingdom of Judah. It was pillaged (973 B.C.) by Sesac (Shishak) king of Egypt (2 Chron. xii. 9), by Joash king of Israel (4 Kings (2 Chron. xii. yi, by Jossa king of Israel (4 Kings xiv. 13, 14); and finally (588 B.C.), it was taken, after a siege of three years, by Nabuchodonosu, who razed its walls, and destroyed the temple and palaces by fire (4 Kings xxv.). Having been rebuilt after the Captivity (536 B.C.), it was again taken and pillaged under Ptolemy Lagos (320 B.C.), and under Autiochus Epiphanes (161 B.C.), after the well-known and mysterious repulse of Heliodorus (176 B.C.); and Pompey (63 B.C.) took the city on the anniversary of its capture by Nabuchodonosor, put 12,000 of the inhabitants to the sword, and razed the walls to the ground, sparing at the same time the treasures of the sanctuary. However, a few years later, they were pillaged (31 nc.) by Crassus; and from these beginnings dates the continued series of Roman aggressions, which terminated in the complete destruction of the city and dispersion of the Jewish race, under Vespasian and Titus (70 A.D.). From the description of the contemporary historian Josephus, we learn that at this period, J., which occupied the four hills Zion, Acra, Moriah, and Bezetha (separated from each other by deep valleys or gorges), consisted of three distinct regions—the Upper City, with the citadel of Zion; the Lower City, which lay to the north, on the hills of Acra and Moriah; and the New City, still further to the northward. The temple stood on the hill of Moriah, and John Hyrcanus built, on the north-western angle of this hill, a fortress called Baris, which was strengthened and beautified by Herod, and called 'Antonia,' in honour of Mark Antony. Herod's own palace stood at the of Mark Alltony. Hereds own pance should have northern extremity of the Upper City, and on the eastern angle was an open place called Xystus, surrounded by galleries, and communicating by a bridge with the temple. The environs of the city uring with the temple. He environs on the city were adorned with gardens, parks, ponds, and tombs. In the progress of ages, ancient J. was surrounded by three walls, the direction of which, in some portions of their course, is difficult to be deter-mined, although it is upon this that the controversy as to the authentic site of the Holy Sepulchre (q. v.) mainly turns. (A plan of the city will be given along with the map of PALESTINE, q. v.) The first and most ancient wall surrounded the Upper City on the hill of Zion, and joined on its northern side the prodromum of the temple. The second wall, or the wall of Ezechias, enclosed the hill Acra, around which stood the Lower City. It was con-nected at the sonth-western angle with the first wall, from which it ran in a semicircle to the north and north-east, surrounding the Upper City till it joined the fortress Antonia, described above. The third wall, built by Herod Agrippa, which enclosed the hill Bezetha and the so-called New City, appears to have started from the north-western angle of the first wall, probably at the tower called 'Hippieus, and to have taken a northerly and north-easterly direction around the New City till it met the of Judan and penjuant, see me of a train and north-eastern angle of the temple wall. It thus, the northern city lay within the territory Benja- for a part of its course, was external to the section in. Its historical importance dates from the time wall. The site of the Church of the high Sprachen of David, who there fixed his residence, calling it and the Hill of Calvary are thus supposed, by the

defenders of their authenticity, to have been without the wall of J. as it stood in the days of our Lordthat is, the second wall, although they were taken in by the subsequent extension of the city a short time afterwards, when the third wall was built, at some distance to the west of the second, by Herod Agrippa. The investigation of the exact direction of the second wall has long been an object of desire with biblical antiquaries, and it is probable that the excavations now projected or in progress will

The city destroyed by Tius was rebuilt by Hadrian; but only as a heathen and Roman city, under the name Ælia Capitolina, with a temple of under the name ZEMA Capitalna, with a coupe of Jupiter; not as the capital of the Jewish race, who were forbidden, under pain of death, to visit it. Constantine, under the inspiration of his mother Helena, took measures to consecrate and perpetuate its Christian memories by ascertaining the sites of the various events in the Passion of our Lord, and erecting on them churches and other suitable memorials of those seenes of the redemption of the world, which thenceforward became an object of pious veneration to pilgrims from every part of the plous veneration to pignins from every part of the church. On the contrary, Julian the Apostate, with the design, according to the contemporary Christian account, of falsifying the prediction of our Lord, that 'not one stone should be left upon another,' encouraged and assisted the Jews to return and rebuild their ancient capital; an enterprise which, as the same writers-supported, in most respects, by the pagan historian Ammianus Marcellinus (xxiii. 1)—affirm, was frustrated by

an earthquake or eruption, which the Christians ascribed to divine interposition.

J. again fell under foreign domination in 614, when it was stormed by the Persian king, Chosroes II. It was restored to the Emperor Herachus in 11. It was restored to the Emperor Regards in 628; but in 637 it fell into the hands of the Calif Omar, and in 1077 passed under the Turkman domination. During this long period, the practice of pilgrimages to J. was never entirely interrupted. In consideration of a tribute paid by each Christian visitor, a contemptuous permission was accorded for the purpose; but the cruelties practised on the pilgrims by the Turks being reported in the West, and especially by the fiery enthusiast Peter the Hermit, aroused the piety and chivalry of Europe, and led to that extraordinary succession of holy wars which for a time restored the tomb of our Lord and the holy city to Christian hands. On the 15th July 1099, J. was taken by assault, and was declared the capital of a Christian kingdom. Through a rapid succession of undistinguished names, with the exception of the first, the celebrated Godfrey of Bouillon, the new sovereignty was precariously maintained until 1187, when it fell once more before the arms of the great Saladin, since which time—if we except the brief and empty pageant in which Frederick II., emperor of Germany, having assumed the title by a collusive treaty with the sultan, entered into J. in March treaty with the suitain, entered into 3. In Marcei 1229—the city can hardly be said to have known other than Moslem rulers. It was retaken by the Sultan of Damasaens in 1230; and although it was given up in 1241 to the Knights Hospitallers, they were driven out in the year 1244 by the Chorasmian Turks, by whom the ascendency of the Croscent was finally established. It was captured from the Saracens by the Mamelnkes in 1382, but recovered in 1517 by the Sultan Selim, whose son, the celebrated Soliman, built the wall which at present encloses the city. J. is now the seat of a pasha, with the ordinary powers of a Turkish viceroy.

E long., on an elevation of 2000 feet above the level of the Mediterranean, from the nearest point of which it is distant 29 miles east. In its present shape, it is an irregular square, and is still sur-rounded by the embattled wall, about 23 miles in circumference, creeted by the Sultan Soliman. The modern enclosure, however, is far from coinciding with that of the Jewish period. In addi-tion to the changes produced by the rebuilding of the city under Hadrian, by which the greater part of the region anciently called the New City was excluded, the stream of population in the Christian period having flowed towards the Holy Places, the modern city has extended considerably towards the west. The four hills on which the ancient city stood are enclosed within the modern precincts; but the portion of the old city which lay north of Bezetha is now excluded, and the valleys between the hills having been filled up by accumulation of ruins, but little inequality of surface is now observable. The streets are narrow, unpaved, and irregular, and the houses gloomy and unsym-metrical; although, owing to its striking position, especially when viewed from the east, and to the number of minarets and domes which rise above the level of the flat-roofed houses, the general appearance of the city, seen from without, is picturesque and pleasing. There are seven gates, of which the principal are the Jaffa Gate, the Damascus Gate, the Stephen's Gate, and the Zion Gate. II lines be drawn between these four gates, the city will be divided into four parts, which almost coincide with the four quarters into which the population -Christian, Armenian, Jewish, and Moslem-is divided; the Christians occupying the north-west, the Armenians the south-west, the Jewish the south-east, and the Mohammedans the north-east portions of the space within the wall. Of the population—which is about 25,000—one-half is Mohammedan; of the remaining half, 7500 are Christians of the various rites, the rest being Jews. To all alike, the city is the seat of many sacred associations. The Jews have seven small and mean synagogues. The Mohammedans, since the days of the first occupation, have held possession of the site of the Temple of Solomon, on which the so-called Mosque of Omar now stands; and the pasha's Seraiyah, or official residence, occupies the site of the Tower Antonia. The Church of the Holy Sepulchre (see Holy Places), with its enclosure, which is occupied by all the Christian commu-nities in common, has been already described. The Latins possess, for their own worship, the Church of St Saviour; it is attached to the Franciscan convent, in which Europeans of all denominations convent, in which Europeans of all denominations receive ready hospitality. In like manner, the Greeks, Armenians, Syrians, Copts, and Abyssinians have convents or hospitals appropriated to their several communions. That of the Armenians on Mount Zion is said to be one of the richest in the East; and the same communion possesses another convent on the reputed site of the house of Caiaphas. The street leading from the Eastern or Stephen's Gate to the Holy Sepulchre is called the Via Dolorosa, and is believed to follow the route of our Lord's sorrowful procession from the Hall of Judgment to Mount Calvary. In other parts of the city or its immediate environs, are shewn the reputed sites of the Mount of Olives, the Tomb of the Virgin, the Pool of Bethesda, the Petter's Field, and the sites of almost all the events of the l'assion of our Lord or of scenes connected therewith. The authenticity of these sites has been the subject of considerable controversy in later times. See HOLY PLACES. Beyond its religious associations, ordinary powers of a relative transfer of the present condition of Holy Places. Beyond its religious associations, the city. It is situated in 31° 46° 43" N. lat., 35° 13′ the modern city possesses few advantages. It is entirely without commerce; and its only branch of industry is the manufacture of heads, crucifixes, and sculptured shells, or tablets of mother-of-pearl. In these objects, an active traffic is practised with the pilgrims, who number about 10,000 annually; and considerable quantities are exported to Spain, Italy, and France. The beads are either berries or are manufactured either from date-stones or from a species of hard wood called Mecca fruit. For the use of the Mohammedan pilgrims—for whom the Mosque of Onar is only inferior in sacredness to Mecca and Medina-a considerable manufacture is carried on of amulets of black stone, which are reputed to be a protection against the plague.

In ecclesiastical history, J. has not filled the space which might at first sight he expected. When the city was rebuilt after its destruction under Titus, the new city Ælia was so inconsiderable as a Christian community, that it became a suffragan see of the metropolitan of Casarca. The Council of Nice recognised a precedency of honour; but it was not till the Council of Chalcedon that the church of J. was raised to the rank of a patriarchate, with jurisdiction over all the bishops of Palestine. J., however, ranked last among the eastern patriarchates. In common with the other eastern churches, J. followed in the train of Constantinople in its secession from the West. The patriarch of J. was a party to the decree of union in the Council of Florence; but his flock soon fell back into schism; and although the titular rank of patriarch of J. has been maintained in Rome, the church remained under the care of the Franciscan community, and the Latin patriarch had never resided in J. until the accession of the present pope, Pius IX., by whom the duty of residence was re-established. In the year 1841, the governments of England and Prussia united for the establishment of a Protestant bishopric in J., the appointment to which rests alternately with England and with Prussia.—See Robinson's Biblical Researches, Stanley's Sinai and Palestine, Williams's Holy City, Richardson's Travels along the Mediterranean, Ritter's Erdkunde, Sepp's Forschungen eines Teutschen Reisenden; and on the Patriarchate. Wiltsch's Kirchliche Geographie, Le Quien's Oriens Christianus, Mosheim's Church History, Barclay, J.T., City of the Great King, Phila., 1858.

JERUSALEM ARTICHOKE, OF TOPINAM-BURI (Helianthus tuberosus), a plant of the natural order Composite, and of the same genus with the common Sunflower (q. v.), is a native of Brazil. The word Jerusalem, in the English name, is a corruption of the Italian girasole, sunflower; the name artichoke is merely from a supposed similarity of flavour in the eatable part—the tuber—to the artichoke. The J. A. has straight simple stems from eight to twelve feet high, and many rough ovate acute stalked leaves; and in the end of autumn, but rarely in Scotland, produces yellow flowers resembling those of the common sunflower, but smaller. The thick, fleshy, and knotted perennial root produces, pretty closely around it, oval or roundish tubers, sometimes thirty or fifty in number, which are reddish on the outside, and whitish within, in appearance very similar to potatoes. They have a sweetish, mucilaginous taste when boiled, and are much more watery and less nourishing than potatoes. They watery and less nourishing than potatoes. They are, however, very palatable, when properly prepared with sauce, and make very good soup. The plant is also useful for fodder for cattle, yielded by its leaves and the more tender parts of the stems.

parts of Europe. It is common, however, in gardens, and was known in our gardens before the potato, to which it in some measure gave place.

Jerusalem Artichoke (Helianthus tuberosus).

generally propagated by small tubers, or cuttings of tubers, like the potato; and its cultivation is in most respects similar, although the aspect of the plant is very different.

JERVIS, John, Earl of St Vincent, a British admiral, was born January 9, 1734. He obtained a commission in the navy as lieutenant in 1755, and in 1769 commanded the Alarm frigate in the Mediterranean. When she was paid off, he made a tour of inspection to the naval arsenals of France and Northern Europe. He was then appointed to the Northern Europe. He was then appointed to the Poudrogand, the finest two-deck ship in the British navy, and engaging the Pegase, 74, off Brest, he took her without the loss of a man. For this gallant exploit, he was made K.C.B. In 1787, he was made exprove the was made ACC. In 1797, he was made rear-admiral; in 1793, he commanded the naval part of the expedition against the West India Islands, Sir C. Grey commanding the troops; and so successful was this expedition, that although the French were well prepared, and fought desperately, every island fell in succession into the hands of the British. In 1795, he received the command of the British. In 1795, he received the command of the Mediterranen fleet; and here, for the first time, her made the acquaintance of Nelson, Hood, Colling-wood, Hallowell, Troubridge, &c. On the 14th Feb. 1796, with only fifteen sail of the line, he fell in, off Cape St Vincent, with the Spanish fleet of twenty-seven sail. Without a moment's hesitation, J. determined to engage the enemy; and the battle of St Vincent was fought. The genius of Nelson, however, contributed greatly to the success of the day. For this victory, the king created J. Earl St Vincent, and parliament settled upon him a pension of £3000 a year. After having, by great firmness, repressed a mutiny off Cadiz, which threatened the represent a muchy of cautz, which threatened the loss of the whole fleet, he was compelled by ill health to return home. He was soon applied to by government to subdue the spirit of sedition which had openly manifested itself in the Channel fleet; by its fleaves and the more cause parts of the seems. As the three file of the stems many probably the seems and leaves government to subdute the spirit of sedition which contain much utile, and have been used for making plotsh. He had, a secretary an agricultural crop and the Britain, held. A is secretary an agricultural crop having been supported by the secretary and secretar Admiralty, and for a second time commanded the Channel fleet, he retired into private life, and died March 13, 1823. A public monument was erected to his memory in St Paul's Cathedral. History has enrolled the name of St Vincent in the first rank of the eminent naval commanders who broke the maritime power of France and Spain, and estab-

JE'SSAMINE. See JASMINE

JESSANT, in Heraldry, springing forth, a term frequently used as synonymous with Issuant, rising,

doing, from the bottom line of a field, or upper line of an ordinary. Jessant is sometimes used improperly for naissant, or rising from the middle of an ordinary The phrase jessant-de-lis is used with respect to a strange heraldic device representing a leopard's head affronté with a fleur-de-lis passing through it. The family

of Morcley, Hants, bears sable, a leopard's head argent jessant-de-lis; and gules, three leopards'

heads jessant-de-lis or, are the arms of the family of Cantelupe.

JE'SSO. See YESSO.

JESSO'RE, a town of Bengal Proper, capital of a district of the same name, is 77 miles to the north-east of Calcutta, in lat. 23° 10′ N., and long. 89° 10' E. Here, in 1838, was erected, by the zemindars of the neighbourhood, a handsome and commodious school, in which instruction is given in English, Persian, and Bengali.—The district of Jessore contains 3512 square miles, and about 400.000 inhabitants. Salt is obtained from the prepared from the sap of the palm-tree.

JESSULME'RE, a fortified city of Rajpootana, capital of the protected state of the same name, contains about 35,000 inhabitants. It is in lat 26° 56 N., and long 70 58° E, being 1290 miles to the north-west of Calcutta. It has several Jaina temples, an area of 12,252 square miles, and about 75,000 inhabitants. The country is poor and sterile, and the public revenue is under £9000.

JE'SUITS, or SOCIETY OF JESUS, a celebrated the political history of the world. It was founded Fevre, a Savoyard; three Spaniards-James Lainez, Francis Xavier, and Nicholas Bobadilla; and a Portuguese named Rodriguez. The original object of association was limited to a pilgrimage to the Holy Land, and a mission for the conversion of infidels; but as all access to the Holy Land was precluded by the outbreak of a war with the Turks, the associates turned their thoughts to a more comprehensive organisation, specially designed to meet those more modern requirements which had arisen since the Reformation. With this view, Ignatius of Loyola, with Lainez and Le Fevre, having meanwhile recruited several new associates, repaired to Rome in 1559, and submitted to the pope, Paul III., the rule of the proposed order, the great aim of which was expressed in their adopted motto: Ad majorem Dei Glorium (To God's ence, comprised a fourth, whereby the members bound themselves unreservedly to go as missionaries to any country which the pope might indicate to them. The new rule was approved by a bull dated September 27, 1540; and in the following year, the association was practically inaugurated at Rome, by the election of Ignatius of Lovola as its first

The constitution of the society, as originally framed, has undergone so few subsequent modifications that it may be described, at the outset, without described as absolutely monarchical, yet it is, in many respects, strictly limited. It is true that the general—who is elected by a general congregation, consisting of professed members selected for the purpose by the whole body of professed members in the various provinces-holds his office for life; and although he is aided in his government by a council of five assistants from the five chief provinces, he is not obliged to follow their voice, even when unanimous. But, on the other hand, he is strictly bound by the constitutions of the order; nor, although he may dispense in particular cases, is he competent, of his own authority, to annul or to alter any of their constitutions. In like manner, although no instance of deposition has ever occurred, he is liable to be deposed by the sentence of a general congregation, in certain contingencies which are specifically pointed

out by the constitutious.

The body over which this general presides consists of four classes: I. Professed, who, having passed through all preparatory stages, which commonly extend over ten or twelve years, or even a longer period, have solumnly taken the vows described above, including that of obcdience to the pope. It is from this class alone that the general and all the higher officials of the society are chosen. 2. Coadjutors, spiritual and temporal: the former who have completed their studies, and have (seldom before their thirty-second year, or even later) been admitted to holy orders—being designed to assist the professed in preaching, teaching, and the directhe minor and menial offices of the society are assigned. 3. Scholastics, who, having passed through the novitiate, are engaged for a long series of years, either in pursning their own studies, or in teaching in the various schools of the order. 4. Lastly, novices, who, after a short trial as 'postulants' for admission, are engaged for two years exclusively in spiritual exercises, prayer, meditation, ascetic reading, or asectic practices, and generally in a course of disciplinary training. The administrative and executive government of the society, throughout the various provinces or countries into which it is divided, is intrusted, under the general, to provincials, who are named by the general, and hold office, as do all the other officials, for three years. In each separate province, there are three kinds of communities-professed houses or residences, colleges, and novitiates. Not only the superiors of these houses who are called by different names-but also all the various office-bearers in each, are appointed by the general, who receives at stated intervals-monthly from provinces, quarterly from colleges and novi-tiates—a detailed report of the character, conduct, and position of each member of the society. In all these gradations the subordination is complete, and the obligation of obedience is immediate and unreserved; and one of the most familiar accusations against the society is, that this duty of blind and implicit obedience makes the superior the sole and final arbiter of conscience for all his subjects, the greater glory); and the vow of which, in addition final arbiter of conscience for all his subjects the to the threefold obligations enginen to all Catholic judge of good and evil, of virtue and of vice. Never-religious orders, of chastity, poverty, and obedit theless, whatever may be said of the practical

tendency of this relation, the J. and their apologists plead that, both in the rules of St Ignatius and in the so-called 'examen' of the candidate, there is contained, in the duty of obedience to a superior, an explicit reservation for the subject, 'unless where

the superior should command what is sinful.'

Such is the internal organisation of this extraordinary association. The system of training applied to the formation of its members exhibits the most profound knowledge of the human heart, and the most correct appreciation of the religious instincts and impulses of mankind. The long exercises of the novitiate were designed by Ignatius to form the individual character in habits of personal holiness, and practices of personal piety. It was the business of the school and college to form the social character of the future teachers of men, and directors of the destinies of society. To learning carefully adapted to the actual condition and progress of knowledge, they sought to add manners and habits calculated to inspire confidence, and to disarm prejudice and suspicion. Unlike the older orders, they made no parade of a special calling, whether by a peculiar habit, or by peculiar exterior indications of austerity or asceticism. They enjoyed, indeed, in these respects, some exemptions from the more austere practices of other orders. Their churches were but designed as supplementary to those of were out deagned as supplementary to those or the parish clergy (whose ordinary costume they adopted as their own conventual dress), without the canonical services, without much imposing or attractive ceremonial, being chiefly appropriated for religious instruction, and for the duties of the confessional. Their casuistry avoided all harsh and excessive rigour; and it cannot be doubted and excessive rigour; and it cannot be doubted that many members carried it to the opposite extreme. But above all, they addressed them-selves to the great want of their time—education; and through the mastery which they soon obtained in this important field, as well as their eminence in every department of learning, divinity, philosophy, history, scholarship, antiquities, and letters, they attained to unbounded influence in every department of society. It may be added that to their extraor-dinary success in thus drawing to themselves, for education, the youth of every country into which they were introduced, the historians of the society ascribe much of the opposition which they encountered from the universities and collegiate bodies whose monopolies they invaded.

The organisation of the society is settled, in every important particular, by the original rules and constitutions of St Ignatius. The opponents of the J., however, allege that, in addition to these public and avowed constitutions, there exists in the society, for the guidance of their hidden actions, and for the private direction of the thoroughly and for the private direction of the thoroughly initiated members, a secret code, entitled Monita Scoreta (Secret Instructions), which was meant to be reserved solely for the private guidance of the more advanced members, and which was not only not to be communicated to the general body, but was to be boldly repudiated by all, should its property of the private guidance of the property of the private guidance of the guidance o This singular code, a master-piece of craft and duplicity, was first printed at Cracow in 1612, and has been repeatedly reprinted by the enemies of the J.; but it is indignantly disclaimed by the society. The accounts of the time and circumstances of its discovery are suspicious and contradictory. It has been repeatedly condemned, both at Rome and by other ecclesiastical authorities, and its apocryphal character is now commonly admitted (see Barbier,

very briefly, to allude to each separately, dividing it into three stages—the rise, the suppression, and the restoration of the order

In Italy, its early career was brilliant and unclouded. Before the death of the first general, Ignatius, in 1556, the Italian J. had swelled to 1000 in number, and the order was established in twelve provinces. Their first check in Italy occurred in Venice. In the contest of this republic with Paul V. (q. v.), the J., taking the side of Rome, accepted, iu 1606, the alternative, proposed by the senate, of leaving the Venetian territory; nor was it till 1656 that they were re-established in Venice, from which time they continued to enjoy undisturbed influence in Italy until the suppression of the order.
The earliest settlements of the J. outside of Italy

were in Portugal and Spain. In 1540, Rodriguez
—who was a Portuguese nobleman—and Francis Xavier opened colleges in Portugal, at the invitation of the king. Francis Borgia, Duke of Gandia, in Spain, was equally well received in his native country, where the order flourished so rapidly, that, at the time of the suppression, the Spanish J.

numbered above 6000.

In France, although a house for novices was founded in Paris by St Ignatius in 1542, the university opposed their introduction as unnecessary, and irreconcilable with its privileges. They were distasteful to supporters of the Gallican liberties, and still more to the Huguenots. The jurists, the parliament, and the partisans of absolutism, were alarmed by the free political opinions which had found expression in some of the Jesuit schools. On the other hand, the democratic party attributed to them a sinister use of their influence with courts. And thus their progress was slow, and their position at all times precarious. It was with much difficulty that the parliament of Paris con-sented to register the royal decree which authorised their establishment. In more than one instance, ther establishment. In more than one instance, the university protested against their schools as invading its privileges. In the wars of the League, they did not fail to make new enemies; and at length, the assassination of Henry III. by Clement (although no evidence of any connection with the J. appeared in his case), and the circumstance, still more industriously urged against them, that Chatel, who attempted the life of Henry IV., had at one time been a pupil in their schools, led to their expulsion from France in 1594. They were reinstated, however, in 1603; but on the assassination of Henry IV. by Ravaillac, the outcry against them was renewed. Although it seems quite certain that this clamour was utterly without foundation, yet the opinions held by one of their order, Mariana (q. v.), on the right of revolt, although condemned by the general, gave a colour to this and every similar imputation. A less deep but more permanent and formidable movement against them was gradually stirred up at a later period, by a combination of all the causes of unpopularity already described, to which new point was given by the well-known Jansenist con-troversy, and by the questions as to the imputed laxity of the moral teaching of the J., and their alleged corrupt and demoralising casuistry. What the ponderous and indignant prelections of the Sorbonne, and the learned folios of the Dominican and Augustinian schools had failed to accomplish, the wit and brilliancy of the celebrated *Lettres Provinciales* of Pascal (q. v.) effectually and trium-phantly achieved. The intolerable laxity of some of the Jesuit casuists was mercilessly exposed by this brilliant adversary as the authorised teaching of the Dictionnaire des Anonymes.

The history of the society is so varied in the larly ascribed to the society were placed before different countries, that it is necessary, although the world in a light at once exquisitely anusing

The and fatal to the reputation of the body. attempts at rejoinder on the part of the J. but served to fix the ridicule more firmly. Of the thousands who laughed at the happy humour, or sympathised with the vigorous raillery, of Pascal, few, indeed, could plod through the heavy and pointless scholasticism of his adversaries. In vain the J. insisted that the obnoxious casnists had been condemned by the society itself; in vain they shewed where their opinions differed from those imputed to them. The wit of Pascal remained unanswered; and whatever were the logical merits of the controversy, no doubt could be entertained as to its popular issue. The bitter pleasantries, too, of the Provincial Letters were but a foretaste of the acrimony of the later Jansenistical controversies, in which the J, stored up for themselves an accumulation of animosities in the most various quarters, the divines, the lawyers, the courtiers, which were destined to bear hitter fruit in the later history of the society in France. Nevertheless, after a long conflict, they enjoyed a temporary triumph in the last years of the Regency and the beginning of the reign of Louis XV.

In Germany, the Jesuit institute was received with general and immediate favour. In the Catholic territories, Austria, Bavaria, and the Rhenish principalities, they not only founded colleges and other establishments of their own, but they were appointed at Ingolstadt and other universities to hold important professorships, and received in many dioceses the charge of the episcopal seminaries then newly established. Before the death of the first general, St Ignatus, the order could reckon in Germany 26 colleges and 10 professed houses; and Lainez, the second general, was able to say that there was scarce a German town of note which had not a Jesuit college. In the mixed states, their career was not so nnclouded. Their great learning and ability, and thorough devotion to the church, made them at once eager and formidable polemics. In Hungary and eager and formidable potenties. In Irungary air Transylvania, much bitterness arose out of their introduction; the same may be said of Bohemia and Moravia; and through the whole course of the Thirty Years War, the J., though in many instances wrongfully, were regarded by the belli-gerent Protestants as the soul and centre of the

Catholic camp. In the Netherlands, they encountered some oppo-sition at first; but in 1562, Lainez, the second general of the order, came to the Low Countries, and a college was opened at Louvain, which eventually became one of the greatest colleges of the order. In the Netherlands, the Jansenistical party was less numerous and less influential than in kingdoms, the J. obtained entrance only as missionarres, and in some, as in England, Scotland, and Ireland, under circumstances of great difficulty and peril. From England they were excluded by the penal laws under pain of death; nevertheless, with a constancy and devotedness which it is impossible not to admire, they maintained through the worst times an unbroken succession of missionaries in many parts of England. They often resorted to the most singular disguises, and generally bore false names; and several of the old Roman Catholic mansions still shew the 'Priest-hole,' which was contrived as a retreat for them in cases of sudden emergency. Into Ireland they effected an entrance almost at the first foundation, and after many vicissitudes, towards the close of the reign of

Charles It., they had more than one considerable college for the education of youth. But a still more fertile field for the enterprise of

the order was that of the missions to the heathen, in which, from their very origin, they engaged, and in which they soon attained to a success which out-stripped all the older orders in the church. In the Portuguese colonies of India, the successes of Francis Xavier (q. v.) are well known. The results of their missions in China and Japan (see RICCI, SCHALL), though more checkered by the conflict with other missionaries, were, from the character of the people, even more extraordinary. In Northern and Central America, also, the J. had extensive and highly successful missions. Above all, their establishments in the southern continent, in Brazil, in Paraguay, and Uruguay, upon the Pacific coast, in California, and the l'hilippine Islands, were missions of civilisation as much as of religion; and Sir John Bowring recognises in the condition of the native population of the Philippines to the present day, the results of the sound and judicious culture of which the early Jesuit fathers laid the foundation.

Such in its various branches was this great and wonderfully organised association in the first stage of its history. At the celebration of their first of its instory. At the convortion of their lines, centenary jubilee, they already numbered [13,112, distributed over 32 provinces. At the date of their suppression, a century later, they had increased to 22,589, and were possessed of 24 professed houses, 669 colleges, 176 seminaries, 61 novitates, 333 residences, and 275 missionary stations in infield countries, or in the Productors state of the production of the Productors of the Productors and 275 missionary stations for productions of the Productors at state of Ferrometers. countries, or in the Protestant states of Europe.

The decline in the fortunes of the J., although its origin dates far back into the 17th c., was rapid and decisive in its consummation. The first blow which they sustained was in Portugal. An exchange of colonial territory having been effected between that colonia territory having been elected new terms whiredom and the erown of Spain, the so-called 'Reductions' of Paraguay (q. v.), in which the Jesuit missionaries possessed an authority all but sovereign, were transferred to Portugal. The native Indians having resisted this transfer, the Portnguese ascribed their disaffection to the J. missionaries. The Portnguese minister, Pombal de Carvalho, to whom the J. allege that their possessiens in Portugal had long been an object of desire, instituted a commission of inquiry; and while it was still pending, an attempt on the life of the king, Joseph, which, as in the similar attempts on Henry HI. and Henry IV., was hald to the charge of the J., furnished him with a fresh ground of impeachment; and without waiting any juridical proof of either accusation, he issued, in parameter proof of either accusation, 46 issued, in September 1759, a royal decree, by which the whole order was definitively expelled from the kingdom. This example was followed in other kingdoms. In France, under the ministry of the Duke de Choiseul, the immediate occasion of the disgrace of the J. was a trial in the civil courts. Father Lavalette, as procurator of the order in the island of Martinique, had consigned to a commercial house in Marseilles two large and valuable eargoes. These cargoes having been seized by English cruisers, and Lavalette being unable to meet the bills which he had drawn upon the credit of their delivery, the Marseilles merchants proceeded against the order. The provincial parlia-ment having decided in favour of the merchants' claim, the J. pleaded that Lavalette acted not only without the authority of the order, but against the positive constitutions, and appealed to the parlia-ment of Paris against the provincial sentence. The inquiry thus raised presented an opportunity of which the ancient enemies of the order in the parliament eagerly availed themselves. A report on the con-stitutions of the society, highly damnatory, was speedily drawn up, and a demand was made for the suppression of the order, as irreconcilable, in its

constitution and practice, with the interests of the state and of society. A strong effort was made by the French bishops, and by Pope Clement XIII., to arrest the proceeding; but a powerful court-faction, aided by the secret influence of the royal mistress, Madame de Pompadour, who was irritated by the refusal of absolution by her Jesuit confessor unless remsa of assument by her Jesuic comessor unessor means on condition of her separating from the king, and supported in the public press by the then rising philosophic party, carried all voices, public and private, against the Jesuits. An attempt at compromise was proposed to the general, Father Ricci, by which the obnoxious constitutions might be abolished or modified; but his unbending reply, 'Sint ut sunt, aut non sint' ('Let them be as they are, or let them cease to exist'), cut short all negotiation; and a royal edict was published in 1764, by which the society was suppressed in the French territory. This example was followed by Spain, under the ministry of Aranda, in 1767, in circum-stances of great harshness and severity; and by the minor Bourbon courts of Naples, Parma, and the minor Bourbon courts of Naples, Parma, and Modena. The court of Rome had zealously but vainly interposed in their behalf, and during the pontificate of Clement XIII, they received from him a support only the more warm because of the hostility which they encountered elsewhere. But his successor, Clement XIV. (q. v.), inclining in this and all other questions of church and state to the side of peace, having in vain endeavoured to procent from the courts by which they were con-demned a relaxation of the severity, and being pressed by the analysasadors of France and Statin. definied a relaxation of the severity, and being pressed by the ambassadors of France and Spain, at length issued, July 21, 1773, the celebrated bull, 'Dominus ac Redemptor Noster,' by which, without adopting the charges made against the society, or inquiring into the question of their justice, acting solely on the motive of 'the peace of the church,' he suppressed the society in all the states of Christendom. The bull was put into execution without delay. In Spain and Portugal alone, the members of the society were driven into exile. In other Catholic countries, they were permitted to remain as individuals engaged in the ministry or in literary occupations; and in two kingdoms, Prussia under Frederick the Great, and Russia under Catherine, they were even permitted to retain a quasi-corporate existence as a society for education.

the society, proved but a temporary suspension. The ex-members continued in large numbers, especially in the Papal States and Northern Italy; and soon after the first storm of the Revolution had blown over, measures began to be taken for the restoration of the society. The first overt reorganisation of them was in 1799, in the duchy of Parma, at an inconsiderable town called Colorno, in which one of the earliest novices was the afterwards celebrated Angelo Mai. This proceeding on the part of the Duke of Parma was barely tolerated by the pope; but in 1801, Pius VII. permitted the re-establishment of the society in Lithuania and White Russia, and with still more formality in Sicily in the year 1804. It was not, however, until after the restoration, and the return of Pius VII. from captivity, that the complete rehabilitation of the Jesuit order was effected, by the publication of the bidl Solicitudo Omnium Ecclesiarum, August 7, 1814. In the same year, they opened a novitiate at Rome; and in 1824, their ancient college, the Collegio Romano, was restored to them. In Modena, Sardinia, and Naples, they were re-established in 1815, as also in Spain,

What was meant, however, to be the suppression of

the J. shared the fate of the other religious establishments, which fell under the double influence of revolution and retrenchment. In Portugal, they have never obtained a firm footing. Dom Mignel, in 1832, issued a decree for their restoration; but almost before they had entered into possession, the order was reversed by Dom Pedro in 1833. Their position in France has been one of sufferance rather than of positive authorisation; nevertheless, they are very numerous and influential, and their educational institutions hold the very highest rank. In Belgium, they established themselves after the revolution, and they now possess many large establishments, professed houses as well as colleges, which are very numerously attended by the Catholic youth, as well of Belgium as of other countries. In Holland, also, they possess several considerable houses, as well as in England, Ireland, the United States, and within a recent period, Scotland. In Switzerland, they opened in 1818 a college at Fribourg, which became a most flourishing establishment, and subsequently they extended themselves to Schwytz and Lucerne; but the war of the Sonderhund (one of the main causes of which arose from the Jesuit question) ended in their expulsion from the Swiss territory. Of the German states, Bavaria and Austria tolerated their re-establishment for educational purposes. In the Italian provinces of the former, as also in the Tyrol, they had enjoyed a certain freedom until the revolution of 1848. In Russia, they were placed under sharp restrictions in 1817; and a few years later, 1820, in consequence of their successful efforts at proselytism, they were banished by a final ukase from the Russian territory, whence they still remain excluded. The Italian revolution has seriously affected their position in that country: in 1848, Pius IX. found it expedient to permit, and it is supposed even to counsel, the breaking up of the college and other houses in Rome, They report the conege and other noises in Kome. Incy returned, however, with the pope himself, and were placed in possession of their ancient establishments. From Sardinia, Naples, Sicily, and the annexed territories of the kingdom of Italy in general, they withdrew at the first indication of the change, the members of these provinces being now distributed through the houses of the order in different parts of the church. The literature of the history of the or the charter. In intertains of the initory of the J., whether hostile or friendly, is almost endless in extent and variety; we shall only refer to the two most recent works on either side, Gioberti's Il Gesuita Moderno, 1847, and Cretinean Joly's Histoire de la Compagnie de Jesus, 1845.

JESUITS' BARK. See CINCHONA.

JE'SUS, the Greek form of the Hebrew word Joshua, Jehoshua, 'Jehovah, the Saviour,' is the name given to the son of the Virgin Mary by the angels who announced his approaching birth (Matt. i. 21; Luke i. 31). The reason of the name was at the same time declared: 'for he shall save his people from their sins.

The date of the birth of J. is now generally fixed a few years—at least four years—before the com-mencement of the Christian era. The reasons of this opinion we cannot here state, but it may be observed that the reckoning of dates from the birth of Christ did not begin till the 6th c., when error on such a point was very probable. The precise date of the birth of J., however, cannot be determined, nor can the year of his death be much more confidently stated. The common computation fixes his death in 33 A.D., or when he was probably at uney were re-essentiated in 1515, as also in Spain, in section in 25.2. Jo. When he was procasily at where their ancient property and possessions were least 37 years of age. As to the month or day of restored to them. They were again suppressed by the birth of J., nothing is known, although the the Cortes in 1820, and again restored in 1825; but circumstance, that shepherds were watching their at the final change of public affairs in Spain in 1835, flocks by night, makes it very certain that it did not take place at that time at which the festival of Christmas (q. v.) is held.

With the accounts given by the Evangelists of the birth of J., his ministry, death, resurrection, and ascension into heaven, every one may be supposed

The opponents of Christianity have not, in general, disputed the historic truth of the gospel narrative of the life of J.; the miracles of course excepted. Celsus and other heathen writers admitted even the truth of the miracles, but alleged them to have been wrought by magic, or to have been too few and inconsiderable to attest the claims of Jesus. Their modern successors have, of course, rejected these views. Some of them have endeapower, but this has not been a prevalent theory. adapting his conduct and teaching to the notions common among the Jews, and in particular to their expectation of the Messiah; whilst they admit the unequalled excellency of the religious and moral system taught by him. The inconsistency of this scheme is held to be obvious by orthodox theologians. They allege that it represents the poblest and The character of J., as displayed both in his life and in his teaching, is one of the great arguments

The correspondence of J. with Abgarus, king of Edessa, although we have it in Eusebius, can only be ranked with monkish legends. Of no greater value are descriptions of the personal appearance of J., and pictures of him. See Christ, Pictures of.

relied on by the advocates of Christianity.

JESUS, College of, Oxford, In 1571, Oneen Elizabeth, on the petition of Dr Hugh Ap-rice, or Price, granted a charter for the foundation of Jesus College, in which there were to be a principal, eight fellows, and eight scholars. In 1622, King James I. granted the college a new charter, including a code of statutes. These original foundations were set on a new footing in 1685 by the will of Sir Leoline Jenkyns, who added considerable endowments to the college, but arranged that the ments were subsequently increased to 19 fellowships and 18 scholarships. The commissions under 17 and 18 Vict. c. 31, converted five of the fellowships ship. Of the remaining fellowships, one moiety was confined to the Principality, and the other thrown open. Four may be lay fellows; the others must take orders within one year after they shall be of sufficient standing to be masters of arts. The scholarships are confined to Wales, with the exception of King Charles I.'s scholarships (confined to Jersey and Guernsey), and two others, which are open. There are nearly thirty exhibitions in this college, of about £40 per annum. This college presents to about 20 livings; in 1862, there were about 160 names on the books. This was the first Protestant college, and in its statutes the Protestant religion was asserted and guarded by

JESUS COLLEGE, Cambridge, was founded by John Alcock, Bishop of Ely, in 1496, to whom the king granted for the purpose the nunnery of St Radegund, which was suppressed for the dissolute conduct of its inmates. The appointment of the master rests with the Bishop of Ely. There are sixteen foundations, and three bye-fellowships, and members of this college are to be noted Richard

Archbishop Cranmer; and Fisher, Bishop of Rochester in the reign of Henry VIII.

JESUS, SON OF STRACH. See ECCLESIASTICUS. JET, a bituminous mineral of a perfectly black of being easily cut and carved, and of receiving a very beautiful polish. It takes its name from a river of Lycia, from the banks of which it was obtained. In the time of Pliny, the name of the river and a small town on its bank was Gages, and the pieces of jet obtained from thence were called gagates, afterwards successively corrupted into gagat and jet. It is now found in many parts of the world. In Great Britan, it is obtained chiefly at Whitby, in Yorkshire, where it is found mixed with fragments of bituminised wood of coniferous trees in the Upper Lias or Alum Shale of that district. Jet is only a peculiar form of pitch-coal, containing about 371 per cent, of volatile matter, like the Albertite of New Brunswick and some of the cannel coals. It is electrical when rubbed, hence it has been called black amber by the Prussian amber-diggers, when it occurs in sand and gravel beds.

Very large quantities are obtained in France in the department of Ande, where it gives employment to numerous artisans, who form it into rosary heads, crosses, and other trinkets, which are extensively sold in Roman Catholic countries. Spain also supplies fine jet, which, like that of the French workings, is found in irregular veins in the lower marls of the cretaceous series, corresponding with the Sussex gault. The Spanish jet is found at Villaviciosa, in the province of the Asturias, and is principally manufactured at Oviedo. As a material for mourning ornaments, jet is admirably adapted, and for that purpose is used largely in this and

other countries.

JETSAM means goods east into the sea, which sink and remain under water. They belong to the Crown until the owner appear and claim them. FLOTSAM. The subject is now chiefly important from its effects on the owners, and is treated under the head of Jettison (q. v.).

JETTISON, in the law of G. Britain and the U. States, the throwing overboard of a ship's cargo, either in whole or in part, in cases of necessity, so as to lighten the vessel in a storm, or to prevent capture, or for other justifiable cause. It is obvious that great discretion is required, so as to judge when the proper time arrives for resorting to this desperate expedient; and in case of part only of the cargo being sacrificed, to select which part. Each case must depend on its own circumstances; and the master of the vessel is the authorised agent so as to bind all parties in such a situation. It often happens that the goods belong to different owners, and therefore, in order to compensate the owner of the particular goods thrown overhoard, the doctrine of general average is resorted to. See Average. In case of a storm, the several persons interested in the ship, freight, and cargo in general contribute rateably to the loss; but there are exceptions when the goods were carried on deck, When the goods sacrificed by jettison have been insured, the insurer has the benefit of this contribution or average pro tanto.

JEW, THE WANDERING, The legend of the Wandering Jew, who cannot die, but, as the punishment of his sin, is obliged to wander over the face of the earth till Christ shall pronounce his doom at the last day, seems to have originated in that passage of the gospel of St John (xxi. 22) where Jesus says of John: 'If I will that he tarry till I come, Fox, Bishop of Winchester in the reign of Henry VII.; what is that to thee? follow thou me. Then went

this saving abroad among the brethren, that that disciple should not die.' It arose, probably, in the 13th c., when it is first related by Matthew Paris, and may be supposed to indicate the Jewish people, scattered throughout the world, and nowhere finding a home. According to the current legend, the Wandering Jew is Ahasuerus, the shoemaker at Jerusalem, who, when the Saviour wished to rest before his house, on his way to Golgotha, drove him away. Another legend states him to be Pilate's door-keeper, Kartaphilus, who struck Jesus on the back, as he led him out of his master's judgmenthall. So recently as the last century, impostors took advantage of the belief in this legend, and gave themselves out for the Wandering Jew; and people were not wanting who, from time to time, maintained that he had appeared to them under different forms. A popular book relating in detail the history of the Wandering Jew has been repeatedly printed in the German, French, Dutch, and Latin languages. The legend has likewise been frequently worked up in a poetical form, as by A. W. von Schlegel in the romance entitled Die Warnung; by Schubert in his poem of Ahasuer; by Goethe in Aus meinem Leben; by Mrs Norton in The Undjung One (Lond, 1842); and by Eugène Sue in his Le Juif errant. Compare Grässe, Die Sage vom Ewigen

JEWEL (Ital. giolello, from giola, joy), a personal ornament, usually understood to mean a decoration in which one or more precious stones are the terms gen and jewel; the former belongs especially to precious stones, and the latter to ornaments formed of the precious metals with or without the aid of gems. The word is derived from the Italian niola, joy, whence giolello, a jewel, such ornaments being indicative of pleasure.

JEWELLERY. The manufacture of jewels has in all times been a test of the artistic powers of a nation; for, being intended only for personal adornment, the genius of the jeweller has been directed to the production of the largest amount of beauty in the most limited space. It is probable that the wearing of ornaments of gold and silver is almost as early as the discovery of those metals. A mere hole drilled through the small pieces of gold or silver, to enable them to be strung round the waist or neck, would be the first stage; then, when the ductility of the metals became known, they would be beaten probably into bands or rings, giving rise to ring money; these rings, when increased in size, would become torques for the waist, neck, arms, or ankles, labrets for the lips, and rings for the ears and fingers. As refinement increased, these articles would be made more and more ornamental; and the original object, of mere convenience and safety in carrying the nuch-valued metals, would be lost in the secondary one valued metais, would be lost in the secondary ofte of personal adornment; the art of the goldsmith would be called into play, and the taste of the nation would be marked by the good or bad designs in demand for this purpose. Jewels being mere articles of luxury and taste, their possession always indicates to a certain extent the wealth of nations, and we are as much impressed with the advanced state of the ancient Egyptians by the nice art and refined taste exhibited in the jewellery found in their tombs, as by the vast architectural works of which they have left so many remains; indeed, modern art, with all its wondrous advances, cannot do more than equal the exquisite workmanship of those elegant golden jewels sent by the late viceroy of Egypt and M. Mariette to the Inter-national Exhibition, which were taken from the

toubs of ladies of distinction, whose mummies they were found decorating. There is an essential difference between the jewellery of ancient and modernt times. Our goldsmiths depend very much upon the processes of casting, drawing, stamping, and other metallurgical operations, and produce for the control of the proposet, depending entirely upon the taste and skill of the artist, instead of the perfection of his tools and mechanical arrangements; consequently, their works hear the stamp of artistic productions, whilst modern works, however beautiful, except the control of the process of the control of the production of the control of the production of th

JEWELS, USE OF, IN HERADDY, By an egregiously absurd and unnecessary complication of one mencature, introduced by way of adding dignity to the science of Heraldry, the tinctures of the arms of peers have sometimes been designated by the mannes of precious stomes; argent is pearl or crystal; and or, topaz; gules, ruby; azure, supphire; sable, diamond; vert, emerald; and purpure, amethyst.

JEWISH LITURGY. See LITURGY.

JEWISH SECTS, a term generally applied (after Josephus) to certain divergent schools which grew up in the midst of Judaism, subsequently to the Syrian wars. So far, however, from forming, as the word would seem to imply, separate communities with places of worship and a religious law of their own, antagonistic to that of their brethren, the disciples of the different 'sects' belonged to the same religions community, adhered to the same practical religions Law, and consequently could not well look upon each other as, in a manner, heretics. The chief points at issue were certain abstract doctrines, in connection with the peculiar manner in which this Law, as far as it is contained in the Scriptures, was interpreted and further developed. While the *Pharisees* (q. v.) claimed for certain time-hallowed observances and doctrines not found in the Bible a divine origin, drawing them back through tradition - orally transmitted from generation to generation - to Moses and the Sinai itself, and while they, by peculiar rules of an exegosis of their own, proved these same doctrines to lie often latent, as it were, in the very letters of the Bible —the Saddaces (a, v.) rejected the divine origin of the 'oral law,' as well as certain spiritual dogmas not distinctly set forth in the Sacred Record. An advanced or exalted class of Pharises were the Essenes (q. v.), who formed a kind of brotherhood. far away (with only solitary exceptions) from the corruption of cities, chiefly intent upon the exercise of practical virtues, and ruled by a severe code of morals. The tenets of each of these three 'sects' will be found treated separately under the headings indicated.

At a later period, shortly before and after Christ, numerous divergent religious doctrines, for the most part the result of a confused mixture of Judaism and Rellenism, or rather Alexandraisms usee GNOSTICS), were promulgated, and found adherents both within and without the pale of Judaism. Many and obscure are the names of those 'sects' recorded by the early fathers of the church, but very little is known respecting their history and dogmas. Mention is made of Heliceinus (Hellichets), not to be confounded with the large body of the Hellenists (Qu Judaism Language (Christianising Jews?), Herodicus (adherents of the loreing overnment?), Gualloniss (Christianising Jews?), Headlaise (alkheimist

of exaggerated tendencies?), Mashotheans (strict Sabbatarians?), Hemerobaptists (Essencs?), &c.

In the 5th Christian c. (761 according to Munk), the Sadducean doctrine of the invalidity of the 'oral law' a doctrine which had died out after oflice (Resh Gelutha? Gaon?) at Bagdad at the time and who, rejecting the Talmud and Midrash as the work of man, only allowed such laws and ordinances to be binding upon the community which resulted immediately from a simple and natural Scriptural He thus became the founder of the most important sect of the Karnites, who, within an astonishingly brief period, spread over Palestine, Egypt, Greece, Barbary, Spain, Syria, Tartary, Byzantinm, Fez, Morocco, and even to the ranges of the Atlas. They are now, however, found only in small numbers in Poland, Galicia, Odessa, the Crimea, Constantinople, Jerusalem, and Alexandria. gating the 'rabbinical' traditions, they erected a new traditional system of their own, to be altered and freely developed by each of their successive spiritual heads. Prayer, fasting, pilgrimages to Hebron, are the points of religious gractice to which they pay the greatest attention. to be of the highest moral standard. They have produced an extensive special Hebrew literature of their own, chiefly consisting of works on theology, philosophy, mathematics, astronomy, &c. The greatest number of these is now found in the Imperial Library at St Petersburg. Some of their principal authors are Anan, Shahnon b. Jeruham, Joseph b. Noah, Jeshua, Jehudah Hadassi, Aron b. Joseph, Aron b. Eliah, Eliah Beshitzi, Kaleb, Moses Beshizi, Mardochai b. Nissan, &c.

Another rather curious sect, known as the Sheben, was that founded by Sabbathai Levi from Snyrna, 1625–1677), who proclaimed himself the Messiah, and found numerous followers throughout Germany, Poland, Italy, and Holland. Sultan Mohammed IV, however, put an end to his mission by inprisoning him, and making him adopt Mohammedanism. Many of his disciples followed his example, others turned Roman Catholics—subhring, withal, to their former doctrines and tenets, consisting chiefy of the belief in the Messiahship of their master, a distinct leasing to the dogma of the Frinty, and the abandonment of the hope of a final return to Jerusdem under the guidance of a final return to Jerusdem under the guidance of a final return to Jerusdem under the guidance of the hope of a final return to Jerusdem under the guidance of the properties of

We have finally to mention the modern (Coasidim not to be confounded with the ancient Chasidim (n, v)—or Beshters (Baal Shem Tolo, a side branch of the former sect, taking its stand like this on the Kabbala, but remaining estemably within the prevince of rubbinical Judaism. They are chiefly remarkable by their wild mode of praying, their supreme contempt for any but mystical and religious science, by their belief in the mixed-body of the contempt of any but mystical and religious science, by their belief in the mixed-body of the contempt of the community unconditionally, are supposed to be invested with divine powers, and who also cure all their bodily ailments. The grandeur and pomp with which these are aurounded, contrasts most strikingly

with the simple mode of life of their flock. Constant repentance, psyfulners, disinterestedness, benevolcues, peacefulness, an introplity, challed on the constant of the constant of the constant of the properties of the constant of the constant of the peaceful decrine of this sect. One of the great repeaceful wherever, brought against them is, that their 'joyfulness' often locals them into transgression; that, in fact, they are rather given to sensuality. They are very numerous in Poland, Gallein, Russia, and Palestrus.

The modern 'Reformers,' aiming chiefly at a simplification of the ceremonia, and abroagation of what they consider to be abuses and late additions in the drive worship, cannot well be called a sectalthough, for the most part, they have synangueues and prayer looks of their own—since they belong, to all other intents and purposes, to the great body of the Jewish community. As the chief promoters of this movement may be considered Zunz, Geiger, (Cherin, Crezenach, Holdheim, Hess, Stern, &c.

JEWS (corrupted from Yehudim), the name given, since the Babylonish captivity, to the descendants of the patriarch Abraham, who, about 2000 years E. C., emigrated from Mesopotamia, on the east side of the Euphrates, to Canaan or Palestine. They were originally called HEBREWS (q.v.). Monotheism, or a belief in one God, the practice of circumcision, and the expectation of ultimately possessing the land in which they then sojourned, were the three distinguishing peculiarities transmeter the three distinguishing peculiarities trans-mitted by Abraham to Isaac, and from Isaac to Jacob and his descendants. The picture of patri-archal life presented to us in the book of Genesis is marked by an exquisite beauty and simplicity, and bears traces of a great antiquity. In consequence of a famine in Canaan, Jacob, on the invitation of his son Joseph, who had become chief minister of the king of Egypt, wan had become ener with all his family, which numbered seventy 'souls;' and obtained from Pharaoh permission to settle in the land of Goshen. Here the Hebrews resided, according to Exed, xii, 40, 430 years; [Bunsen (Exopts) calculates fourteen centuries]; according to the genealogical table of the Levites, in Exod. vi. 16-25, however, their sojourn would not have lasted longer than 210 or 215 years; most of the commentators, therefore, take, with Josephus, the 430 years to indicate the period from Abraham to the Exodus (cf. Galat. iii, 17). During the life-time of Joseph, and probably for some generations afterwards, they were well treated, and prospered; but a new dynasty, supposed by some with little shew of reason to have been that of the Hykshos (q. v.) arose, and they were reduced to relentless slavery. A deliverer at length appeared in the person of Moses (q. v.), a man of grave and heroic character, who, though brought up by the daughter of Pharaoh as her son, and trained in all the learning of the Egyptians, was nevertheless filled with an intense and indignant patriotism, that acquired an additional elevation from the ardour of his religious feelings. The circumstances that preceded and characterised the exodus (about 1600 B. C.) -such as the ten plagues and the crossing of the Red Sea are a source of continual controversy between the Rationalistic and the Supranatural istic schools of hiblical criticism; but the fact of an exodus would be disputed only by the wildest scepticism. The entire history of the people is pervaded by the memory of this grand event, upon which, as it were, their whole national existence is based; it inspires their poetry, and consecrates their religion; and the Passover, with all its ceremonials and mementoes, was instituted expressly to remind them of that wondrous night of sudden liberation; while the Feast of Tabernacles was to recall to the memory of the latest generations the to whom it was originally assigned at the first division wanderings through the desert; and Pentecost, the of the land.

act of the legislation on Sinai. Whether, however, in 215, or even in 430 years, the seventy 'soals' could have increased to 600,000 adult men, or, including wives and children, to between 2,000,000 and 3,000,000 souls, is a point to be determined rather by

physiologists than by theologians.

The wandering in the wilderness of the Sinaitic peninsula is said to have lasted forty years, though a record of the events of two years only has been preserved. These, however, are obviously the most important, as they contain an elaborate account of the giving of the law (Exod. xix. et seq.), which is represented as a direct revelation made to Moses by Jehovah himself, who descended upon Mount Sinai in fire, amid the roar of thunders and the quaking of hills. The antiquity, however, of the priestly or ceclesiastical portions of the Pentateuch is keenly disputed by many modern scholars of the highest reputation, who endeavour to shew the probability of such passages having been composed and inserted subsequent to the great organisation of the priesthood by David; and in proof of this, point, among other evidences, to the Book of Judges (q. v.), which narrates the history of the Hebrews for 300 years after the conquest of Canaan, and which yet coutains scarcely a single trace of the existence of a religious institution among them. Yet it is allowed almost on all hands, that the foundations, at least, of the Jewish theocracy, and probably also a large part of the superstructure, were the direct work of Moses himself, who indeed appears to have been pre-eminently fitted for the task of a legislator :not to mention the fact that the ritualism of the Hebrews has many striking points of contact with that of the ancient Egyptians, with which he was well acquainted. This view, of course, does not interfere with the theory of a later composition of the Pentateuch (q. v.), in its present shape and its successive redactions and enlargements. But whatever period be allowed for the sojourn in the desert, the rough nomadic life, the frequent fighting with the fierce Beduin tribes, through whose territories they passed-besides the lofty influences of a stern religion-had transformed the runaway slaves of Egypt, by the time they approached the eastern horders of Canaan, into a nation of high-spirited and irresistible warriors.

Before proceeding further, it behoves us to trace a general outline of the Mosaic legislation. The laws promulgated under the 'Covenant' were, as we said, not entirely new. Many were merely the solemn confirmation of aucient patriarchal tenets, such as the worship of One Supreme Being through sacrifices, prayer, vows; circumcision; the government by heads of tribes and families, &c. must have been adaptations of Egyptian institu-Others, again, owed their existence to the altered circumstances of the community; and it is undeniable that some of the ordinances contained in the Pentateuch were never carried into practice. The fundamental features of the religious as well as political constitution-both closely interwoven with each other—are the following: God is Creator and Lord of the universe. The universe is His own, and to man the use of all created things has been intrusted by His will. God is therefore the King of the people. By the priests He is visibly represented. No man has the right to dispose of his own liberty. The soil is only given to the people for the usufruct; man has no further individual right of possession over it. Every seventh year it is to be left to itself. The sale of land is prohibited; and after seven times seven years, every lease and mortgage of it is null and void, and it is to return to the heirs of those

The office of the Priests (q, v,) was in the lambs of the tritle of Levi (q, v.), more especially the descendants of Anron (q, v.). The Levites assisted in the management of the sanctanry and the holy rites, copied and expounded the Books of the Law, kept the genealogical lists, and had the care of the general instruction of the people. Together with the priests, they had administrative and judicial functions, and they gave their judgment always in the name of God. The High-Priest (q, v.) constituted the highest court, and his was the oracle (Urin and Thummin). Feriodical Feasts (q, v.) were instituted, in order that the dependence of the people, the people, Every severnth day the holy should rest from labour (Sabhath), as every seventhy very the people. Every severnth day (avr); and every fiftieth (7 × 7) year (Johel) was the great very constituted, partly of an agricultural, partly of an historical character, were the Passah (q, v.), the Feast of Wedeks (q, v.), and the Feast of Tabernacles (q, v.). No less was the first of the seventh month to be kept holy.

The tenth of the same month was instituted a day of atonement and forgiveness of sin.

The form of government was at first a theocratical one. The people was divided into 12 tribes, which formed small republics, but were all united noder the invisible rule of Jehovah. General national assemblies decided upon war and peace, and the like. Special provisions are also found for the contingency Special provisions are also total for the contingency of the election of a king. After the conquest of Palestine, every city had a judge, chosen by the heads of the families and tribes. The punishments were either death, flagellation, or fines. Three Levitical cities were named by Moses as asylums or places of refuge for man-slayers whose guilt was not yet fully established. Every free citizen was bound, from his 20th year, to military service in case of war. To the besieged city, terms of capitulation were first to be offered; were these rejected, the city was to be taken, and the males were to be put to the sword. In all other cases, the virtues of charity, justice, and kindness, even towards animals, are repeatedly impressed upon the people. How far these fundamental rules were either further developed or neglected, we cannot shew in this place.

The 'land of promise' became theirs at last (about 1430 B.C.), under Joshua (q. v.), the successor of Moses. Tribe after tribe was swept from its ancient territory, and for the most part either annihilated or forced to flee. Yet the whole bulk of the native inhabitants was not extirpated or wholly expelled, nor even subdued till a much later period: a circumstance fraught indeed with the most disastrous consequences to the new commonwealth. The country was now divided among the tribes. The magnificent pastoral region to the east of the Jordan had before been chosen by the tribe; of Reuben, Gad, and the half-tribe of Manasseh at an earlier period, because they 'had a very great multitude of cattle' (Numb. xxxii. 1); but they now for the first time entered on possession of it. The land west of the Jordan was parcelled out to the remaining-Judah, Simeon, Dan, Benjamin, Ephraim, the second half-tribe of Manassel, Issachar, Zebulon, Naphtali, and Asher. The tribe of Levi received, instead of a province, 48 cities scattered throughout Canaan and the tenth part of the fruits of the field, and were allowed generally to settle individually throughout the land where they chose (LEVITES, PRIESTS, HIGH-PRIEST).

After the death of Joshua (about 1350 B.C.), the

want of a chief to the young state became sadly palpable. Little regard was paid to the 'Mosaic' institutions: the single tribes pursued their own individual interests; intermarriages with the idolatrous patives weakened the bond of union still further; and the next consequence was, that the tribes were singly subdued by the surrounding nations. At this juncture there arose at intervals valiant men and women Shofetim Judges, who liberated the people from their oppressors, the Moabites, Philistines, Ammonites, Amalekites, &c. Fifteen of those are named, some of whom appear to have been contemporary with each other, and to have exercised authority in different parts of the country. This period constitutes the age of Hebrew history. Among these Judges, the prophetess Deborah (q. v.), Gideon (q. v.), Jephthah (q. v.l. the herculean Samson (q. v.), and the prophet Samuel (q. v.), are especially notable; the last mentioned was, in every sense of the word, the greatest Hebrew that had as yet appeared since the days of Moses. With him begins a new and higher stage in the development of the national character, chiefly through the instrumentality of the priestly order, whose spiritual, for the most part well-directed and humanising, influence was by him first exalted and most distinctly brought to bear upon the commouwealth. Samuel, the first of the prophets, was also the last of the republican chiefs of the confederate tribes. Wearied of their intestine fends, harassed by the incursions of their predatory neighbours, chiefly, however, goaded by the characteristic desire 'to be like all the other nations' (1 Sam. viii, 5). to be fixe all the other nations (1 Sam. vin. 5), the people compelled him, when he had become 'old and gray-headed' (1 Sam. xii. 2)—while the behaviour of his sons, whom he had made judges, untitted them to be his successors to choose for

them a king (1080 a.c.). The first who exercised regal authority was Saul (q. v.), the Benjamite. But though a distinguished not to have possessed the mind of a statesman; and his wilfulness, and the paroxysms of insanity, brought on chiefly, as it would seem, by the openly-expressed dissatisfaction of Samuel, finally alienated from him many of the bravest and best of his subjects. After his death on Mount Gilboa, David (q. v.), his son-in-law, was proclaimed king. This monarch was by far the greatest that ever sat on the throne of Israel. He ruled, as is commonly computed, 1058-1018 B. C. His reign, and that of his equally famous son, Solomon (q. v.), are regarded as the golden time of Hebrew history. remaining aborigines of Canaan and its bordersviz., the Philistines, Edomites, Amalekites, Moabites, &c .- were thoroughly subdued; the boundaries of the Hebrew kingdom were extended as far as the Euphrates and the Red Sea; Jerusalem was captured by escalade, and made the capital of the conqueror; the priesthood was reorganised on a splendid scale; the arts of poetry, music, and architecture were cultivated; schools of prophecy (first established, probably, by Samuel) began to flourish; a magnificent temple for the worship of Jehovah was carried on with Phrenicia, Arabia, Egypt, with India and Ceylon, and perhaps with even Sumatra, Java, and the Spice Islands. But there was a canker at the root of all this prosperity. The enormous and wasteful expenditure of Solomon forced him to lay heavy taxes on the people. His wealth did not enrich them; it rather made them poorer; and

occasionally even cruel, and his reign (1018-978 B.C.) cannot but be regarded, both politically and financially, as a splendid failure. After his death (978), the Hebrew monatchy, in which the germs of dissension—chiefly jealousy against the influence of Judah - had been silently growing up for many a year, split under Rehoboam into two sections (975 B.C.): the kingdom of Judah, under Rehoboam, son of Solomon; and the kingdom of Israel, under Jeroboam, the Ephraimite. The former of these countries comprised the two tribes of Judah these countries comprised the two tribes of Judan and Benjamin, together, probably, with some Danite and Simeonite cities; the latter, the remaining ten. After 19 kings, of different dynasties, among whom Jeroboam, Ahab, Joram, Jeroboam II., Pekah may be mentioned, had reigned in Israel, few of whom succeeded to the throne otherwise than by the nurrler of their predecessors, the country was finally conquered by Salmanassar, king of Assyria; its sovereign, Hoshea, thrown into prison: the mass of the people carried away captive (720 B. C.) into the far east, the mountainous regions of Media, and their place supplied by Assyrian colonists, brought from Babylon, Persia, Shushan, Elam, and other places by Asnappar. These, mingling and intermarrying with the remnant of the Israelites, formed the mixed people called Samaritans (q. v.). Among the twenty kings of the House of David who ruled over Judah, Jehoshaphat, Uzziah, Hezekiah, and Josiah distinguished themselves both by their abilities as rulers, and by their zeal for the worship of Jehovah. Yet even they were, for the most part, unable to stay the idolatrons practices of the people, against which the prophets' voices even could not prevail. Other kings were, for the most part, more or less unfaithful themselves to the religion of their fathers, and unable to withstand the power of the Egyptians, Assyrians, and Babylenians, to each of whom they in turn became tributary, until at last Nebuchadnezzar stormed Jerusalem (586 B. C.), plundered and burned the temple, put out the eyes of King Zedekiah, and carried off the most illustrious and wealthy of the inhalitants prisoners to Babylon. The Israelites, who had been exiled 134 years before the inhabitants of Judah, never returned. What became of them has always been, and, we presume, will always remain, matter of vaguest speculation. See Babylonish

All that we know of the condition of the Hebress during the capitity, relates exclusively to the inhabitants of the kingdom of Judah. And so mild, especially during the later years, was the treatment which they received in the Babylonian empire, that when liberty was announced to the whole body of the captives, only the lowest of the low returned, together with the Levites and Priests (cf. Talm. Kidd. iv. 1). The Book of Eather likewise bears testimony to the vast numbers that had remained scattered over the vast empire. See BARYLONISH CATITUTY.

27 chapters of Isaiah, who is usually called by modern scholars the 'Younger Isaiah,' is held to belong to this period, and expresses in glowing language the hopes of the exiles; no less do many of the Psalms belong to this time. 'From this period, likewise, the immortality of the soul, and the belief in another life, appear more distinctly in the popular creed, in which, if they had existed at all, they had been obscured by the more imme-diate hopes and apprehensions of temporal rewards and punishments revealed in the law. But in the writings of the Babylonian prophets, in the vision of dry bones in Ezekiel, and in the last chapter of Daniel, these doctrines assume a more important place; and from the later books, which are usually called the Apocrypha, these opinions appear to have entered fully into the general belief. In other respects, particularly in their notions of angels, who now appear under particular names, and forming a sort of hierarchy, Jewish opinions acquired a new and peculiar colouring from their intercourse with the Babylonians' (Dean Milman's History of Lend. 1829, vol. ü. pp. 13, 14). Compare articles DEMONS and DEVIL.

articles DESONS and DEVIL.

The exile is generally computed to have lasted seventy years. This is not strictly correct; it lasted seventy years, if reckned from the appearance of Nebuchadnezzar in Anterior Asia (606), but only iffly-two counting from the destruction of Jerusalem. When Cyrus, the Persian king, had overthrown the Babylonian kingdom (358 n.c), the condition of the Hebrews improved considerably. The new monarch must have felt that he could rely on them, as being really strangers in the land, and necessarily more or less hostile to their conquerors, the Babylonians. Daniel rose higher and higher in dignity and power, and finally became 'supreme head of the pashas to whom the provinces of the vast Persian empire were committed.' Through his influence, Cyrus was prevailed upon to issue an edict permitting the exiles to return home. A minute account of the circumstances attending this joyous event is given in the Books of Ezra and Nehemiah. Upwards of 40,000 persons, including four of the twenty-four courses of priests, set out under the leadership of Zerubbabel, a descendant

of their old kings.

Notwithstauding the many and harassing obstacles raised by the Samaritans, the mixed people of Assyrians and Israelites, against whom the scrupulous exiles entertained strong religious and national objections, the rebuilding of the 'Temple of the boyetons, the rebutting of the Temple of the Lord' was at last commenced in the first year of Darius, and in the sixth year of his reign it was finally completed. [HAGGAI; ZACHARLAH.] The waste cities were likewise rebuilt and repeopled. During the long reign of Darius, the J. were blessed with a high degree of material prosperity. Under his successor, Xerxes, probably control the incidents recorded in the Book of Esther. In the seventh year of Artaxerxes, the successor of Xerxes, Ezra the priest, invested with high powers, and accomplished the success of the success of the success of the priest, invested with high powers, and accomplished the success of the success o panied with a great retinue of his professional brethren, headed a second migration. Thirteen years later, during the reign of the same monarch, Nehemiah, his cup-bearer, but a man of Jewish family, was ordered to proceed to Jerusalem, and, aided by Ezra and others, succeeded in secretly fortifying the city, notwithstanding the continuous opposition from Samaritans, Ammonites, and Arabians. The strictest observance of the 'written law,' even of those of its parts which had been for some reason or other disregarded, was now rigorously enforced, and many 'oral ordinances' were put into practice, which do not seem to have been much heard of previously. The supreme spiritual anthority

was vested in a society of pious and pre-eminently learned men, founded by Ezra, out of which grew the 'Great Synagogue,' of whose existence modern scholars no longer see any reason to doubt. The compilation and transcription of the sacred records began, periodical public readings and expoundings of the law were instituted, and the vast Targumic, as well as the so-called rabbinical literature, generally dates-in its earliest beginnings-from this point. During the life of Nebemiah, the breach between the J. and Samaritans became final, by the erection on Mount Gerizim (near Samaria) of a rival temple to that at Jerusalem, and the creation of a rival priesthood. For more than a hundred years, the J. lived quietly under the Persian yoke, too insignificant to excite any attention from the Greeks, then in the full meridian of their political and literary greatness; and seanty are the accounts which, as yet, have out of the mazes of ancient Jewish literature been brought to light, with respect to the inner intellectual life of the J. during that period. That, although silent, it must have been extremely active and rich, is amply evidenced by the sudden appearance, immediately afterwards, of a vast number of literary productions.

Alexander the Great, on his way to conquer the

whole East, did not deem it necessary to storm Jerusalem. The inhabitants submitted, and he even deigned to have sacrifices offered on his behalf to the national god of his new subjects, a great number of whom, and of Samaritans, he carried away to Egypt (where J. were supposed to have immigrated as early as the time of the last kings of Judah, and later under Artaxerxes Ochus), and peopled a third of his newly-founded city Alexandria with his Jewish captives. After him, Ptolemy the son of Lagos, surnamed Soter, one of Alexander's generals, who had become king of Egypt, invaded Syria, took Jerusalem (301 B.c.), and carried off 100,000 of its inhabitants, whom he forced to settle chiefly in Alexandria and Cyrene. The Egyptian (Alex-andrian) 'Dispersion' (Golah)—destined to be of vastest importance in the development of Judaism and Christianity—gradually spread over the whole country, from the Libyan desert in the north, to the boundaries of Ethiopia in the south, over the Cyrenaica and part of Libya, and along the borders of the African coasts to the Mediterranean. They enjoyed equal rights with their fellow-subjects, both Egyptian and Greek, and were admitted to the highest dignities and offices : so that many further immigrants followed of their own free-will. The free development which was allowed them, enabled them to reach, under Greek auspices, the highest eminence in science and art. lu Greek strategy and Greek statesmanship, Greek learning and Greek refinement, they were ready and brilliant disciples ; even their artisans and workmen were sent by distant countries. From the number of Judgeo-Greek fragments, historical, didactic, epic, &c. (by Demetrios, Malchos. Eupolemos, Artapan, Aristaeos, Jason, Ezechielos, Philo, Theodot, &c.), which have survived, we may easily conclude what an immense Silvites, we may say; conclude what an immease literature must have spring up here within a few centuries in the midst of the Judeo-Egyptian community. To this is owing, likewise, the Greek translation of the Bible, known as the Sephangint (q. v.), which, in its turn, while it estranged the people more and more from the language of their people more and uncer from the anguage or state of a fathers, the Hebrew, gave rise to a vast pseudo-epigraphical and apocryphal literature (Orphica, Sybillines, Pseudophoclea; poems by Linns, Homer, Hesiod; additions to Esther, Erra, the Maccahees, Book of Wisdom, Barneh, Jeremiah, Susannah, &c.) not to mention the peculiar Graco-Jewish philosophy. which sprang from a mixture of Hellenism and

Orientalism, of which we have spoken at some

length in the art. GNOSTICS

For a hundred years, Judeas herself remained under Egyptian rule. During the reigns of the first three Ptolemies, Soter, Philadelphus, and Euergetes, if prespered, but after the accession of Ptolemy Philopator, a change for the worse cause over the fortunes of the Jews. Their fate became over the fortunes of the Jews. Their fate became reruled and foodbardy policy could devise, this king outraged the religious feelings of the nation, and endeavoured to tear out every root of the sacred endeavoured to tear out every root of the sacred creed. At different periods he sent his generals to Jerusalem to pillage and hurn, and to force the Jews into the Grock religion. The temple at Jerus tibel altars were built in every village, and the people forced to offer swine daily. Some yielded, many fled, the greater past preferred marrytdom many fled, the greater past preferred marrytdom

in some shape or other.

At this juncture the heroic family of Matathia, a priest of the house of the Asmoneans, rose, together with a few patriots, against the immense power of the Syrians. The national cause quickly gathered strength, and after the death of Matathia (166), Judas Maccabæus (q. v.) led the national hosts to victory against the Syrians. After his death (161 B. C.), his brothers Jonathan and Simon completed the work of deliverance, and re-instituted the Sanhedrim (145 B.C.). During their rule, alliances were twice formed with the Romans, and the country once more began to prosper. Under Simon more especially, Syrian rule became a mere shadow: his was an almost absolute power. So much so, that in the year 170 of the Seleucidian era (142 B.C.), a new Jewish era was commenced, and public documents bore date, 'In the first year of Simon, high-priest and chief of the Jews.' Simon's son, John Hyrcanus, after a brief period of vassalage to the Syrians, extended his authority over Samaria, Galilee, and Idumea-his grand triumph, in the eyes of his countrymen, being the destruction of the Samaritan temple on Mount Gerizim (129 B.c.); but in reality his most surprising success was the subjugation of the Idumeans, and their conversion to the Jewish religion. His son, Aristobulus, added Iturea-a district at the base of the Anti-Libanus -to his dominions, but died, after a short reign, of remorse for the nurder of his mother, Salome Alexandra, to whom the secular dominion had been bequeathed by Hyrcanus, but whom Aristobulus had east into prison, and caused there to die of hunger. The son who succeeded him was Alexander Jannæus. Constantly fighting, and generally beaten, this king yet, strange to say, contrived to enlarge his territories; restless and enterprising as he was cruel and sanguinary, he gave his opponents no rest, and his opponents were all his neighbours in turn, excepting Cleopatra, queen of Egypt. Attached to the Saddnees (q. v.), like his father, and probably something of a pagan, he was disliked by the mass of his countrymen, and a civil war of six years' duration ensued. After a brief period of peace, he died (78 B.C.), recommending, however, his wife, Alexandra, to throw herself into the arms of the very party who had thwarted him all his life, the Pharisees (q. v.), as the best way of retaining her authority. This she did; and governed, on the whole, prudently for nine years. The Pharisaic party, how-ever, abosed the power which fell into their hands, and a reaction took place. Aristobulus, youngest son of the queen, and a prince of great spirit, placed

Afterwards, however, the latter, at the instigation of Antipater, the Idumean, and father of Herod the Great, field to Arctas, king of Northern Arabia, who was induced, by the promise of a cession of the territory which had been acquired by Alexander Jamesus, to take up arms on his behalf. This led to the interference of the Romans, who were then fighting both in Syria and Armenia. After several viciositudes, Jerusalem was captured (63 h. c.) by Pompey, who had decided in favour of Hyreams, and Judeas made dependent on the Roman province of Syria, and Hyreams, appointed ethnarch

sons, Alexander and Antigonis, and two daughters, were carried captive to Rome. In 54 h. C., Licinius Crassus plundered the temple, which Pompey had pionsly sparel; his ill-gotten gains are said to have amounted to \$2,000,000. He fell shortly afterwards in the war against the Parthians, and his companion, Cassins Longus, succeeded in

and high-priest. Aristobulus, however, with his two

completely routing Aristobulus' urmy.

Meanwhile, the war between Casar and Pompey broke out. In Syria, the partisans of the latter were numerous, and contrived to poison Aristobulus, and execute his son Alexander, who were Caesareans (49 n.c.). After the death of Pompey, however, things changed; and Hyrcanus, or rather Antipater the Idumean (who was both his minister and master), saw the necessity of seeuring the favour of Caesar. With Hyrcanus II. ended the line of Asmonean princes: they exercised (nominally) supreme authority both in the civil and religious allairs of Palestine, i.e., they were both sovereigns and high-priests; but, as we have already indicated, the real religious authority had passed into the hands of the priesthood, and especially of the Sanhedrim (q. v.). The Idumean dynasty, which succeeded the Asmoncan, virtually commenced with Antipater, who prevailed on Casar to restrict Hyreanus to the high-priest-hood, and obtained for himself the office of procurator of Judga, while his eldest son Phazael was appointed governor of Jerusalem, and his younger son Herod governor of Galilee. The Jewish or national party took the alarm at this sudden increase of Idumean power; strife ensued; and ultimately Antipater perished by poison; but Herod, by the assistance of the Romans, finally entered Jerusalem in triumph (37 B. C.), caused Antigonus, the last male representative of the Asmonean line, and his most dangerous enemy, to be put to death, and commenced the difficult task of governing a people who were growing more and more unruly every day. The political events which occurred during the government of the Herods, are briefly touched upon under the heads HEROD (q. v.), AGRIPPA (q. v.), and ANTIPATER (q. v.).

After Herol's death (3 n.c.), Archeleas one of his sons, ruled Judea and Samaris; but his arbitrariness, and still more his constant attacks upon religion, made him hatfed to the people; and Augustus, listening to their just complaints, of deprived him of his power, and banished him to Vienne (6 a.D.). Judea was now thrown together with Syria, and was ruled by Roman governors.

numbers. The accession of Claudius, on the assassination of Caligula, seemed, however, the dawn of a brighter day for them. Herod Agrippa, a loyal friend and favourite of the new emperor, obtained anew the dominion over all the parts once ruled by ance the dominion over all the parts once ruled by his grandfather Herod, and many privileges were through his influence granted to his Jewish sub-jects, and even to foreign Jews. They received the rights of Roman citizenship (41 A.D.), and Herod even tried to conciliate their religious prejudices by the strictness with which he observed their law (a circumstance, we may say, in passing, that will account for his persecution of the Christians); yet the national party remained malcontent, and in an almost permanent state of mutiny. After the death of Herod Agrippa I. (his son being but a youth of seventeen) the country was again subjected to Roman governors. The confusion soon became indescribable. The whole land was overron with robbers and assassins, some of whom professed to be animated by religious motives (such as the Sicarii). while others were mere ruffianly freebooters and cut-throats; the antipathy between J. and Samaritans waxed fiercer and fiercer, and the latter waylaid and murdered the orthodox Galileans as they went up to worship at Jerusalem; all sorts of went up to worsing at Jerusalem; an sorts of impostors, fanatics, and pretenders to magic made their appearance; the priesthood was riven by dissensions; the hatreds between the populace and the Roman soldiery (mostly of Græco-Syrian origin), and under the commands of cruel procurators, such as Albinius and Gessius Florus, increased: frightful portents (according to Josephus) appeared in the heavens, until, in 66 A.D., in spite of all the precautionary efforts taken by Agrippa, the party of Zealots, i.e., the Sicarii or Assassins, burst into open rebellion, which, after a horrible carnage (Josephus calculates the number killed at 1.356,460), was terminated (70 A. D.) by the conquest of Jerusalem by Titus, the destruction of the temple, and the massacre and banishment of hundreds of thousands of the unhappy people, who were scat-tered among their brethren in all parts of the world. The defence of Jerusalem (as narrated by Josephus) is one of the most magnificent and melancholy examples of mingled heroism and insanity that the world affords. Still, very considerable numbers were allowed to remain in their native country, and for the next thirty years, although both hated and treated with rigour, they appear, on the whole, to have flourished. The Emperor Nerva was as lenient to them as to the rest of his subjects; but as soon as they had attained some measure of political vitality, their turbulent and fanatical spirit broke out anew. Their last attempts to throw off the Roman yoke, at Cyrene (115 A. D.), Cyprus (116 A. D.), Mesopotamia (118 A. D.), and Palestine, under Bar-Cochba (q. v.), (130 A. D.), were defeated after enormous and almost incredible hutchery. The suppression of Bar-Cochba's insurrection (135 A. D.) marks the final desolation of Judæa, and the dis-persion of its inhabitants. Talmud and Midrash (especially Midrash Echa) appear to exhaust even eastern extravagance in describing what followed the capture of Bither-the great stronghold of the The whole of Judæa was made like a descrt, Jews. about 985 towns and villages lay in ashes, 50 fortresses were razed to the ground; the name of Jerusalem itself was changed into Ælia Capitolina, and a heathen colony settled in the city, from entering which every Jew was strictly deharred. The lardships to which the unfortunate race were subjected, were again alleviated in the reign of Antoninus Pius, whom the Jewish writers represent as secretly attached to their religion (see Jost's Geschichte der

for the homeless exiles. Alexander Severus also for the homeless exites. Alexanuer severus also placed Abraham on the same divine level as he did Christ, and obtained from the grateful people the title of 'Father of the Synagogue.' Heliogabalus, among his many senseless whims, patronised various Jewish practices, such as circumcision and abstinence from swine's flesh; and generally speaking, from the close of the 2d c. till the establishment of Christianity under Constantine (330 A. D.), when their hopes were once more dashed to the ground, their nopes were once more case on the ground, the J. of the Roman empire appear to have thirven astonishingly. In this period falls the redaction of the chief code and basis of the 'Oral Law,' the Mishna (q. v.) completed by Jehuda Hanassi (the Prince), or Hakkudosh (the Saint), president of the great school at Tiberias (220); upon which od the great school at Hoeras (220); upon which code were gratted subsequently the two gigantic commentaries or complements, the Palestiman and the Babylonian Gemaras (q. v.). The Babylonian J. were even more fortunate than their western brethren, though they did not perhaps attain the meridian of their prosperity till the revival of the Persian, on the downfall of the Parthian empire. Their leader was called 'The Prince of the Captivity' (Resh Gelutha), and was chosen from among those held to be descended from the House of David. He lived in great splendour, assumed among his own people the style of a monarch (though extremely submissive to the Parthian or Persian ruler), had a bodyguard, counsellors, cup-Persian ruler), and a soughard, conscious, cap-bearers, &c.; his subjects were, many of them, at least, extremely wealthy, and pursued all sorts of industrial occupations. They were merchants, bankers, artisans, husbandmen, and shepherds; and in particular had the reputation of being the best weavers of the then famous Babylonian garments. In fact, his government was quite an imperium in imperio, and possessed a thoroughly sacerdotal or at least theocratic character. The reputation or at least theoretic character. The reputation for learning of the Babylonian schools, Nahardca, Sura, and Pumbeditha, was very great. What was their condition at this time further east, we cannot tell, but it seems quite certain that they had obtained a footing in China, if not before the time of Christ, at least during the 1st century. They were first discovered by the Jesuit missionaries of the 17th century. They did not appear ever to have heard of Christ, but they possessed the Book of Ezra, and retained, on the whole, a very decided nationalism of creed and character. From their language, it was inferred that they had come originally from Persia. At one time, they would appear to have been highly honoured in China, and to have

Reverting to Europe, the ascendency of Christi-anity, as we have already said, was baneful to the Jews. Imperial edicts and occlesiastical decrees vied with each other in the rigour of their intolerance towards this unhappy people. They were prohibited from making converts, from invoking (in Spain at least) the divine blessing on the country, from marrying Christian women or holding Christian slaves; they were burdened with heavy taxes; yet no persecution apparently could destroy the immortal race. About this time, they are found in large numbers in Illyria, Italy, Spain, Minorca, Gaul, and the Roman towns on the Rhine; they are ngriculturists, traders, and artisans; they hold land; their services, in fact, cannot be dispensed with; Constantine, during whose reign a fierce revolution, incited by his co-regent, Gallus, broke out among the Arians and Jews (358), terms them, in a public document, 'that most hateful of all people;' yet in spite of this, they fill important civil and military attached to their religion (see Jost's Geschichte der situations, have special courts of instice, and exer-Israeliten, &c.), and better times seemed in store cise the influence that springs from the possession

held the highest civil and military offices.

of wealth and knowledge. The brief rule of Julian the Apostate even shed a momentary gleam of splendour over their destinies, and the transport to rebuild the temple at Jerusalem, is one of the most sublime spectacles in their history. The death of this emperor, however, frustrated their labours, and the rapid increase of ecclesiastical power was, of course, hurtful to them in a variety of ways, although the emperors now began, in the decline of their authority, to protect them as far as they could. In 418 A.D., they were excluded from the military service; and in 429 A.D., the patriarchate at Tiberias was abolished. After the fall of the West Roman empire, their fortunes were different in different countries. In Italy, Sicily, and Sardinia, they were for a time almost unmolested; in the Byzantine empire, they suffered many oppressions; while in the 6th and 7th centuries, the Franks and Spanish Visigoths inflicted on them frightful

The sudden volcanic outburst of Mohammedanism in the Arabian peninsula, was at first disastrons to the J. in that part of the world. For several centuries, a Jewish kingdom had existed in the south-west of Arabia. It was called Himyaritis or Homeritis, and was in a flourishing condition 120 years before Christ. About 230 a.D., the Jewish religion even mounted the throne of Yemen. Twice, however (by the Ethiopian kings, Aidog and Ez-Baha), were the Jewish kings driven from it. and the Christian religion was introduced in that part in 530 A. D. At first, Jewish tribes around Meeca and Medina entertained opinions favourable to Mohammed as an Arabian chief, but when Islam began to threaten their own faith, and even existence, they rose in arms against its founder. Mohammed proved the stronger: he subdued the Chaibar tribes in 627 A.D., and the Arabian J. were finally dispossessed of their territories, and removed to Syria. The spread of Mohammedanism through Asiatic Turkey, Persia, Egypt, Africa, and the south of Spain was, nevertheless, on the whole advantageous to the Jews. Excepting accidental and in Egypt (1010 a.D.), they enjoyed, under the ealifs and Arabian princes, comparative peace. In Moorish Spain their numbers greatly increased, and they became famous for their learning as well as for trade. They were connsellors, secretaries, astrologers, or physicians to the Moorish rulers; and this period may well be considered the golden age of fact, that to them is chiefly due -through the Arab medium -the preservation and subsequent spreading osophy, in Europe. There are some medical works in their Arabic translations, the originals being probably lost for ever. Different from their fate under Moslem rule was that which they had to endere in Christendom about this period. Only few rose above the barbarism of the churches. About the beginning of the 11th e., the Byzantine emperor, Basil 11, renewed the persecution; from quite different causes, the same thing had already begun the close of the 11th c., the Prince of the Cap-tivity had perished on the scaffold, the schools were closed, the best of the community had tled to Spain, and those that remained were reduced to an abject condition, from which they have never risen. In Italy, their position was made tolerable by considerable pecuniary sacrifices. Here and there, at intervals, a spirit of Christian intolerance might break out, but they enjoyed for the most part the

protection of the popes.

More favourable was their lot during the 8th and 9th centuries in France, especially in Paris and 9th centuries in France, especially in Laris, Lyon, Languedic, and Provence. At the court of Louis le Dibomaire, they were actually all-powerful. After 877 A.D., however, when the weak Carlovingians had begun to rule, and the church was advancing with imperious strides, a melancholy change ensued-kings, bishops, feudal barons, and even the municipalities, all joined in a carnival of persecution. From the 11th to the 14th c., their history is a successive series of massacres. manner of wild stories were circulated against them: it was said that they were wont to steal the host, to inveigle Christian children into their houses, and murder them; to poison wells, &c. They were also hated for their excessive usury, though there can be no doubt that more blame is attachable to those whose tyranny, by depriving them of the right to narrower channels of traffic. Occasionally, however, their debtors, high and low, had recourse to what they called Christian religion as a very easy means of getting rid of their obligations. Thus, Philippe Auguste, under whose rule the Jews seem to have held mortgages of enormous value on the estates of church and state dignituries, simply confiscated the debts due to them, forced them to surrender the pledges in their possession, seized their goods, and banished them from France; but the decree appears to have taken effect chiefly in the north; yet in less than 20 years, the same proud but wasteful monarch was glad to let them come back and take up their abode in Paris. Louis 1X., who was a very pious prince, among other religious acts, cancelled a third of the claims which the J. had against his subjects, 'for the benefit of his soul.' An edict was also issued for the seizure and destruction of their sacred books; and we are told that, at Paris, twentyfour carts filled with copies of the Tulmud, &c., were consigned to the flames. In the reign of Philippe the Fair, they were again expelled from France (1306 A.D.) with the usual accompaniments of eruelty; but the state of the royal finances rendered it necessary, in little more than a dozen years, to recall necessary, in fuce more than a dozen years, to recan them; and they were allowed to enforce payment of the debts due to them, on condition that two-thirds of the whole should be given up to the king! But a religious epidemic, known as the Rising of the Shepherds, having seized the common people in Languedoe and the central regions of Franco (1321 A.D.), they signalised themselves by horrible massacres of the detested race; so horrible, indeed, that in one place, Verdun, on the Garonne, the J., in the madness of their ngony, threw down their children to the Christian mob, from the tower in which they were gathered, hoping, but in vain, to appease the demoniacal fury of their assailants. In the following year, the plague broke out, and the wildest crimes were laid to their charge. One shudders to read of what followed; in whole proshidders to read of what followed; he whole pro-vinces, every Jew was burned. At Chinon, a deep ditch was day, an enormous pile raised, and 160 of both sexes burned together! Yet Christianity never produced more resolute martyrs; as they sprung into the place of torment, they sang hymns as though they were going to a wedding. Finally, in 1395, they were indefinitely banished from the middle of

Their first appearance in England dates from the period of the Saxons. They are mentioned in the

ecclesiastical constitutions of Egbright, Archbishop of York, 740 A.D.; they are also named in a charter to the monks of Croyland, 833 A.D. William the Conqueror and his son, William Rufus, favoured them; the latter, on the occasion of a public debate between them and the Christians, even swore with humorous profanity, that if the rabbins beat the bishops, 'by the face of St Luke,' he would turn a Jew himself. The same reckless monarch carried Jew Immsett. In easine Fectives monarun carried his contempt for the religious institutions of his kingdom so far, that he actually farmed out the vacant bishoppries to the L; and at Oxford, even then a scat of learning, they possessed three halls—Lombard Hall, Moses Hall, and Jacob Hall, where Hebrew was taught to Christians as well as to the youths of their own persuasion. As they grew in wealth, they grew in unpopularity. On the day of the coronation of Richard the Lion Heart (1189 A.D.), some foreign J. being perceived to witness the spectacle, from which their nation had been strictly excluded, a popular commotion against them broke out in London; their houses were pillaged and bnrned; and though Sir Richard Glanville, the chiefjusticiary of the realm, acting under the orders of the indignant king, partially succeeded in arresting the havoc, and even in bringing some of the mob to justice (three were hanged), yet the harbarons bigotry of priests and people prevented anything like just or salutary punishment. Similar scenes were witnessed at Norwich, Edmundsbury, Stamford, and York; in the last of these towns, most of the J. preferred voluntary martyrdom (Kiddush Hashem) in the synagogue to forced haptism.
When Richard returned from Palestine, their prospects brightened a little; though still treated with great rigour, yet their lives and wealth were protected—for a consideration! John Lack-land at first covered them with honour, but the land at first covered them with honour, but the opopular and priestly hattred only became the stronger; and on a sadden, the vacillating and upprincipled king turned round on his protégés, after they had accumulated great wealth, and imprisoned, malterated, and plundered them in all parts of the country. Under Henry III., they were mulcted enormously. Accused of clipping the coin of the realm, they had, as a penalty, to pay into the royal exchequer (1230 A.D.) a third of their movahle property. To this reign belongs the now excluded story of the crucitision of the Christian movable property. To this reigh helongs one now exploded story of the crucifixion of the Christian boy, Hugh of Lincoln. The accession of Edward did not mitigate their misery; some efforts, indeed, were made to induce them to give up their profession of usury, as was also done in France and elsewhere during the same period, but the fact is, that they were so heavily taxed by the sovereigns or governments of Christendom, and at the same or governments of Universition, and at the same time debarred from almost every other trade or occupation—partly by special decrees, partly by the vulgar pejudice—that they could not affort to prosecute ordinary avocations. The attempt made by the Dominican friars to convert them, of course, failed utterly; and in 1253, the J .- no longer able to withstand the constant hardships to which they were subjected in person and property—begged of their own accord to be allowed to leave the country. Richard of Cornwall, however, persuaded them to Richard of Coriwan, However, personaled the stay. Ultimately, in 1290 A. D., they were driven from the shores of England, pursued by the execrations of the infuriated rabble, and leaving in the hands of the king all their property, debts, obliga-tions, and mortgages. They emigrated for the most part to France and Germany. Their number is estimated at about 16,000.

In Germany, they were looked upon as the special property of the sovereign, who bought and sold

('chamber-servants'). As already said, they made ('Chamber-Servants'). As arready sub, drey made their appearance in that region almost as early as the time of Constantine. About the 8th c., they are found in all the Rheoish towns; in the 10th c., in Saxony and Bohemia; in the 11th, in Swabia, Franconia, and Vienna; and in the 12th, in Bran-denburg and Silesia. The same sort of treatment befell them in the empire as elsewhere; they had to pay all manner of iniquitous taxes-body-tax, capitation-tax, trade-taxes, coronation-tax, and to present a multitude of gifts, to mollify the avarice or supply the necessities of emperors, princes, and barons. raid against the J. was a favourite pastime of a bank-rupt noble in those days. The Crusades kindled

a spirit not in Germany only, however, but through all Christendom, hostile to the 'enemies of Christ.' all Christendom, hostile to the 'caemies of Christ.' Treves, Metz, Cologoe, Mainz, Worms, Spires, Stras-burg, and other cities, were deluged with the blood of the 'unbelievers.' At such epochs, the passions of the populace and of the lower clergy could not be restrained. The word *Hep* (said to be the initials restrained. The word rep issue to be the inflant of Hierosolyma est perdita, Jerusalem is taken) throughout all the cities of the empire became the signal for massacre, and if an insensate monk sounded it along the streets, it threw the rabble sounded it along the streets, it threw the rabble into paroxysms of murderous rage. The J. were expelled—after being plundered and maltreated— from Vienna (1996 a.b.), Mecklenburg (1225 a.b.), Essalus (1226 a.b.), Enudenburg (1236 a.b.), Nürnberg (1230 a.b.), Prague (1391 a.b.), and Ratisbon (1476 a.b.), The Plack Death; in particular, occasioned a A.b.). The Plack Death; in particular, occasioned a great and widespread persecution (1348—1350 A.D.).
They were murdered and burned by thousands, and
many even sought death amidst the configurations
of their synagogues. The race almost disappeared from Germany; only, however, to return, for their services were indispensable. Only here and there, however, they possessed the rights of citizens, or were allowed to hold unmovable property; in general, they were permitted to prosecute only commerce and usury, and the law turned on them its harshest aspect. Repeatedly, too, the emperors gratified at once their piety and their greed by cancelling their pecuniary claims. In many places, they were compelled to live in certain parts of the town, known as the Judenstrasse (Jews' Streets).

Switzerland, whither they came at a comparatively late period, commenced to persecute them about the middle of the 14th century. In the course of the 15th c., they were expelled from Schaffhausen, Zürich, Geneva, Thurgau, and other places.—Their treatment was more humane in Poland and Lithuania. As early as 1264 A. D., they enjoyed in these countries certain important privileges. Favoured by Casimir III, their numbers were swelled, after 1348 A. D., by fagitives from Germany and Switzerland.—Russia and Hungary, like most other countries of Christendom during the middle ages, received, persecuted, and banished thens.

In Spain, the condition of the J. was long highly favourable. The horrible persecutions of the Gothic princes in the 6th and 7th centuries, made it, of course, absolutely inevitable that the first gleam of a Moorish scimitar on the coast would turn them into allies of the invaders. During the whole of the brilliant period of Moorish rule in the Peninsula, they enjoyed, indeed, what must have seemed to them, in comparison with their common fate, a to them, in comparison with their common tate, a sort of Elysian life. They were almost on terms of equality with their Mohammedan masters, rivalled them in civilisation and letters, and probably surpassed them in wealth. The Spanish J. were consequently of a much higher type than their brethren in other parts of Europe. They were not reduced to the common terms of the common terms o them, and were designated his Kammerknechte to the one degrading occupation of usury, though

they followed that too; on the contrary, they were husbandmen, landed proprietors, physicians, financial administrators, &c.; they enjoyed special privileges, and had courts of justice for themselves. Nor was this state of things confined to those portions of Spain under the sovereignty of the Moors : the Christian monarchs of the north and middle gradually came to appreciate the value of their services, and we find them for a time protected and encouraged by the rulers of Aragon and Castile. But the extravagance and consequent poverty of the nobles, as well as the increasing power of the priesthood, ultimately brought about a disastrous change. The estates of the nobles and (it is also believed) those attached to the cathedrals and churches, were in many cases mortgaged to the J.; hence it was not difficult for 'conscience' to get up a persecution, when goaded to its 'duty' by the pressure of want and shame. Gradually, the J. were deprived of the privilege of living where they pleased; their rights were diminished, and their taxes augmented. In Seville, Cordova, Toledo, Valencia, Catalonia, and the island of Majorca, outbursts of priestly and popular violence took place (1391-1392 A.D.); immense numbers were murdered, and wholesale theft was perpetrated by the religious rabble. Escape was possible only through flight to Africa, or by accepting baptism at the point of the sword. The number of these enforced converts to Christianity is reckoned at 200,000. The fate of the J. in Spain during the 15th c., however, beggars description. Persecution, violent conversion, massacre, the tortures of the inquisition-we read of nothing but these! Thousands were burned alive. 'In one year, 280 were burned in Seville alone.' Sometimes the popes, and even the nobles shuddered at the fiendish zeal of the inquisitors, and tried to mitigate it, but in vain. At length the hour of final horror came. In 1492 A. D., Ferdinand and Isabella issued an edict for the expulsion, within four months, of all who refused to become Christians, with the strict inhibition to take neither gold nor silver out of the country. The J. offered an enormous sum for its revocation, and for a moment the sovereigns hesitated; but to compare his royal master and mistress to Judas; they shrank from the awful accusation; and the ruin of the most industrious, the most thriving, the most peaceable, and the most learned of their subjects-and consequently of Spain herself-became irremediable. This is perhaps the grandest and most melancholy hour in their modern history. It is considered by themselves as great a calamity as the destruction of Jerusalem. 300,000 (some even give the numbers at 650,000 or 8:0,000 resolved to abandon the country, which a residence of seven centuries had made almost a second Judga to them. The incidents that marked their departure are heartrending. Almost every land was shut against them. Some, however, ventured into France; others into Italy, Turkey, and Marocco, in the Italy, Turkey, and Marocco, in the fresh the Italy, Turkey, and Marocco, in the Rollow Williams. Of the S0,000 who chained an entrance into Portugal on payment of eight gold pennies a head, but only for eight months, to enable them to obtain means of departure to other countries, many lingered after the expiry of the appointed time, and the poorer were sold as slaves. In 1495 A.D., King Emanuel commanded them to quit his territories, but at the same time issued a secret order that all Jewish children under 14 years of age should be torn from their mothers, retained in Portugal, and brought up as Christians. Agony drove the Jewish mothers into madness: they destroyed their children with their own hands. and threw them into wells and rivers, to prevent

them from falling into the hands of their persecutors. The miscries of those who embraced Christianity, but who, for the most part, secretly adhered to their old faith ($lonssin_1$, $Anossin_{-}$ -yielding to violence, forced ones), were hardly less dreadful, and it was far on in the 17th c. before persecution ceased. Antos da F of suspected converts happened as late as 165 λ a.D.

The wanderers appear to have met with much better treatment in Italy and Tutkey Itan anywhere clase. During the Lith and 16th centuries, they are to be found—except at intervals, when persecution applied its scourge—in almost every city of Italy; pursuing various kinds of traffic (nearly the whole trade of the Levant, for instance, was in their hands), but chiefly engaged in money-lending, in which they rivalled the great Lombard Lenders, Abrahanel, perhaps the most eminent Jewish scholar and divine of his day, rose to be Turkey, they were held in higher estimation than the conquered Greeks; the latter were termed Techir (slaves), but the Jews, Monnephir (visitors), they were allowed to re-open their schools, to establish synapogenes, and to settle in all the

commercial towns of the Levant.

The invention of printing, the revival of learning. and the Reformation, are generally asserted to have been beneficial to the J., but this can be regarded as true only in a certain sense. When the J. began to use the presses at their earliest stage for their own literature, sacred and otherwise, the Emperor Maximilian was urged-chiefly by converts-to order all Hebrew writings to be committed to the flames; and but for the strenuous exertions of Reuehlin (q. v.), ignorance, treachery, and bigotry might have secured a despicable triumph. Luther, in the earlier part of his career, at least, looked with no unfavourable eye on the adoption of violent means for their conversion; and, on the other hand, we find at least one distinguished Roman Catholic, Pope Sextus V., animated by a far more wise and kindly spirit towards them than any Protestant prince of his time. In 1588, he abolished all the persecuting statutes of his predecessors, allowed them to settle and trade in every city of his dominions, to enjoy the free exercise of their religion, and, in respect to the administration of justice and taxation, placed them on a footing with the rest of his subjects. That the Reformation itself had nothing to do with subsequent ameliorations in the condition of the J., is only too plain from the fact, that in many parts of Germany, Protestant as well as Catholic, their lot became actually harder than before. They were driven out of Bavaria (1553 A.D.), out of Brandenburg (1573 A.D.), and similar treatment befolf them elsewhere. They also excited numerous popular tunnits (as late even as 1730 A. D. in the Protestant city of Humburg); and, in fact, during the whole of the 17th and the first part of the 18th c., the hardships inflicted on them by the German governments positively became more and more grievous. What really caused the change in their favour was the great uprising of human reason that marked the middle of the 18th century, Among the writers who distinguished themselves in Germany by pleading the cause of the J., we may specially mention Lessing (q. v.), Mendelssohn (q. v.), and Dohm.

Holland, as we know, was one of the first coun-

Holland, as we know, was one of the first countries in modern times to rise out of the harbarism of the middle ages. Its active, energetic, intelligent inhabitants appreciated the business qualifications of the J., and as early as 1603 A. D., permitted them to settle and trade, though they did not acquire the rights of citizenship till 1796 A. D. In England,

the edict of Edward I. remained in force for more thau 300 years; and the first attempt made by the J. to obtain a legal recognition in that country was during the Protectorate of Cromwell in 1655 A. D. Cromwell himself was favourable to their admission; so were the lawyers; but the nation generally, and particularly the emphatically religious portion of it, were strongly hostile to such a proceeding; and the wearisome, controversial jangling of the divines appointed to consider the question, pre-vented anything from being done till the reign of Charles II., who, standing much and frequently in need of their services, permitted them quietly to settle in the island. In 1723 A.D., they acquired the right to possess land; in 1753 A.D., they obtained the right of naturalisation. Since 1830. civic corporations, since 1833, the profession of advocates, and since 1845, the office of alderman and of lord-mayor, have been opened to them. Recently (1858), the last and crowning triumph of the principle of toleration was achieved by the

admission of J. into parliament.

Some of the relics of that mighty host of exiles that left Spain and Portugal found their way into France, where they long lingered in a miserable condition. In 1550 A.D., they were received into Bayonne and Bordeaux; they were also to be found in considerable numbers in Avionon, Lorraine, and Alsace. In 1784, the capitation-tax was abolished. In 1790, while the French Revolution was still in its pristine vigour, and animated by a sincere humanitarianism, the J. presented a petition to the national representatives claiming equal rights as citizens. Mirabeau was among their advocates, and their cause could not, therefore, be unsuccessful. From this time, their technical designation in France has been *Israelites*. In 1806, the Emperor Napoleon summoned a 'Sanhedrim' of J. to meet at Paris, to whom a variety of questions were put, mainly with a view to test their fitness for being French citizens. Their answers were satisfactory, and they were allowed to reorganise their religious institutions in the most elaborate manner. Since then, no material change has taken place in the laws regarding them; and they are since then found not only in the highest offices of the civil administrationvery frequently in the ministry (e.g., Crémieux, Goudchaux, Fould)—but they also fill some of the chief places in the army and navy. We may add here, that their surpassing bravery in the field has been the subject of frequent remark, more especially since among the vices with which a brutal prejudice loved to brand them, in spite of all historical evidence, was also that of cowardice.— In Denmark, since 1814 A. D., they have been on a footing of equality as citizens with native Danes. -In Sweden, they did not obtain admission till 1776 a.D., and then only into Stockholm and three other towns. Citizenship is still conferred as a favour.—Norway forbade them to touch its soil till 1860 A. D.—Admitted into Russia Proper by till 1890 A.D.—Admitted into Russas Proper by Peter the Great, they were expelled—to the number of 35,000—by the Empress Elizabeth in 1743. Readmitted by the Empress Elizabeth in 1743. Readmitted by the Empress Catharine III, they were further protected by the Emperor Alexander L, who in 1805 and 1809 issued decrees, insuring them full liberty of trade and commerce; but the commerce of the comme were deprived by the late emperor, Nicholas, Since 1835, a scheme of gradual emancipation has been under contemplation.—Poland, however, has become their principal residence. There they are more numerous than in any other part of the world. They owed their first humane reception in the 14th c. to the love which King Casimir the Great

whole trade of the country was in their hands. During the 17th and the greater part of the 18th century, however they were much persecuted, and sank into a state of great ignorance, and even poverty; but education-in spite of the severity and barbarism of Russian intolerance-has, since the French Revolution, made progress among them.— Frederick the Great king of Prussia, shewed himself singularly harsh towards the J.; in fact, his legislation, it has been said, almost throws us back into the middle ages. All manner of iniquitous and ridiculous taxes were laid upon them; only a certain number were allowed to reside in the country, and these were prohibited both from the most honourable and the most lucrative employments. shameful state of matters was ended by the Prussian edict of toleration (1812 A.D.), by which J. were placed almost in an equal position as citizens with other Prussians. Since then, the tendency, on the whole, had been to enlarge their 'liberties'—until the Revolution of 1848 finally gained them their full emancipation, although, owing to the subsequent periods of reaction, it has not as yet been entirely carried out.—In the smaller German states, their full rights have likewise-gradually and grudgingly -been conceded to them at last; and the first German National Assembly held in Frankfurt in 1848 aud 1849 contained many prominent Jewish members, among whom was the vice-president, Riesser .--In Austria, the Emperor Joseph II. distinguished himself by passing an act of toleration, 1782 A.D. This act was extraordinarily liberal in its provisions for the Jews. Not till 1860, however (and even then under certain restrictions), did they acquire the right to possess land.—In Hungary and Transylvania, they have long enjoyed important privileges, and have been protected by the nobility. As a consequence, in the late Hungarian insurrection, they were patriotic to a man .- Spain began to tolerate them again in 1837 A.D., and they can follow trade or agriculture like other Spaniards; but few J. have as yet cared to venture back to a land that fills them with the most mournful recollections .-Portugal, where they enjoy no civic rights, has only a few German Jews.—Switzerland long treated them harshly, and only of late years have a few cantons taken a step in the right direction.

In other countries, their condition must be merely referred to. In Turkey, they are very merely referred to. In Turkey, they are very numerous, and have thriven in spite of the exac-tions of pashas, the insolence of Janizaries, and the miseries of war. Their communities in Constantinople, Adrianople, Saloniki, Smyrna, Aleppo, and Damascus, are considerable; in Palestine, their ancient home, they are said to be rapidly increasing, but they are still, in spite of the many efforts on but they are stir; in spite of the many criticis on the part of their European brothers to ameliorate their condition, very poor. Their numbers in Arabia are not very large, yet they enjoy some independence. Those in Persia have sunk into independence. Indoor in Fersia have sunk into ignorance through oppression, yet it is touching to find that they are not hopeless. 'Heavy,' they say, 'is our slavery; naniously we wait for retemption.' They exist in Afghanistan, and carry on a trade between Cabul and China; in India and Cochin-China, where they are both agriculturists and artisans; in Surinam, there is a flourishing colony; in Bokhara, where they possess equal rights with the other inhabitants, and are skilled in the manufacture of silks and metals; in Tartary and China, where, however, they are very insignificant both in numbers and position. They are also found all along the North African coast, where, indeed, they have had communities for perhaps more than a thousand years, which bore for a Jewish mistress. For many years, the were largely reinforced in consequence of the great

Spanish persecutions. They are numerous in Fez and Marocco, though they are not always free from the perils of Mohammedan fanaticism. In Egypt and Nubia, they are few ; in Abyssinia, more numerous; and it is ascertained that they have even made their way into the heart of Africa; they exist in Sudan, and are also found further south. In the United States, as in Great Britain, they enjoy absolute liberty. A conference of "Reformed Jews" was held in Philadelphia in Nov., 1869, and in N. York the Christian Jews have organised free schools and teach doctrines opposed to Judaism.

The entire number of J. in the world is reckoned variously between 31 and 15 millions. Taking the Variously between 54 and 15 millions. Asking the former estimate, about 1,700,000 helong to Russian, Austrian, and Prussian Poland; about 600,000 to Germany; about 240,000 to Hungary and Transylvania; about 200,000 to Galicia; about 300,000 to Turkey; about 47,000 to Italy; about 30,000 to Great Britain; Asia, about 138,000; Africa, about 504,000; and America, about 30,000. The whole of Europe is supposed to contain about

LANGUAGE AND LITERATURE. Language. Among the Semitic family of languages, the Hebrew (called in the Old Testament, the speech of Canaan; in the later portions of the same book, the speech of Judgea; and first in the Chaldee targums, the Sacred Language, or rather the language of the Sanctuary and things connected with it as the law [Mishna], the prayers, &c.) is one of the oldest, and in regard to strength, refinement, and elaborate completeness of grammatical structure, one of the most remarkable. (Its chief characteristics will be found noticed under Semitic Languages.) Yet it is neither the oldest of Semitic dialects. nor, as was long believed, the first of all human languages. Once identical with the Phrenician, it was adopted by Abraham and his family in Palestine. The peculiar religious and moral notions of the Hebrews could not but impress upon it by degrees a distinct character, and thus Hebrew became a distinct dialect. Although the Sacred writings are the oldest Semitic works which we possess, there is yet, except a few archaisms, hardly any trace of the primitive state of the Hebrew language preserved in them; they belong to periods when it was nearly as fully formed and developed as in the time of the exile. The differences in style, manner, and idiom in the different books, must rather be traced to the individualities of the various writers. In general, we distinguish two distinct periods—the golden age, up to the Babylonian exile, when, except a few Egyptian words, no foreign admixture mars the purity of the language; the second from the exile downwards, when Persian and Aramaic elements had largely been introduced. As we find it in the Bible, the Hebrew is a poor language enough; yet there is a sublime grandeur, and, in the provinces of religion and agriculture, also a richness inherent in it which surpasses almost every ancient and modern language. It is hardly to be presumed, in the absence of distinct traces that there should have been, within the small compass of Palestine, room for several dialects. The different pronunciation of the Shin alluded to in Judges xii. must have been only a solitary peculiarity of the Ephraimites, as, at a later period, the Galileans, and also the inhabitants of Jerusalem, were known for their faulty pronunciation, as shewn in several passages of the New Testament and the Talmud. The Hebrew character still universally employed in writing, and called square, Assyrian or Babylonian character, first takes the place, at in the age of Moses, and in any case was similar to

A grammatical treatment of Hebrew first commenced after the language ceased to be spoken by the people. The vocalisation and accentuation of the text originated in the 6th and 7th centuries after the time of Christ (see MASORA), made the first attempt at a system of grammar about the dawn of the 10th c., after the example of the Arabians, and originally even in the Arabian Rabbi Saadia Gaon (died 942 A.D.), language, Jehuda Chajug (circa 1050 A. p.), Abraham-ben-Esra (circa 1150 A. p.), and David Kimchi (circa 1190—1200) are held in classic repute as grammarians. The Hebrew dictionary of the latter was long considered the best that had been executed. The founder of the study of Hebrew among Christians was the famous Johann Reuchlin (died 1522 A. D.), who, however, like the grammarians of the next age, Buxtorf and others, strictly adhered to the Jewish tradition and method. A new era began when the study of the other members of the Semitic family of languages, the Syriac, the Arabic, and the Ethiopic, enlarged the Hebraist's field of view : the heralds of this era were the German scholars, Alb. Schultens (died 1750) and Nik, W. Schröder (died 1798), who sought to remedy the one-sided defective method into which the so-ealled Dutch school fell by its too exclusive regard for Arabic. Gesenius, especially, along with a comprehensive and due consideration of all the allied languages, devoted his attention to the critical observation and exposition of the individual grammatical facts, and a more just and harmonious explanation of them. Since then, Ewald (q. v.), who treats the Hebrew language as an organism after the historico-genetic method, has carried the study still further, and in some measure superseded Gesenius. Ewald's Grammatik der Hebr. Sprache (Leip. 1844); Gesenius, Hebräische Grammatik (Leip. 1813), the 16th edition by Rödiger (Leip. 1851); are the best known grammars. The most comprehensive Hebrew dictionary is that by Gesenius, entitled Thesaurus Lingua Hebraica (Leip. 1829-1842); the best of the smaller lexicons are Gesenius's Hebr. und Chald. Handwörterbuch über das Alte Testament (2 vols. Leip. 1810-1812; 4th ed. 1834); Winer's Lexicon Manuale Hebraicum et Chaldaicum (Leip. 1828); and Fürst's Hebr. und Chald. Handwörterbuch (Leip. 1857-1861).

Literature.- The extraordinary influence which the religion of the Hebrews has exercised on Christian and Mohammedan nations, has given a universal significance to their ancient literature. In autiquity and credibility, in the religiousness of its form and the vigour of its poetry, it surpasses the literature of any other pre-Christian people, and thus constitutes both the most remarkable monument and the most authentic source of the early history and spiritual development of the human race. trne, however, that only a comparatively scanty portion of it has come down to the present day, and even the contents of what is extant have by no means remained unaltered in the lapse of ages. is quite certain that the Hebrews, in the earliest times, only engraved or cut ont on stone, metal, or nor is there any trace of a material adapted for the record of lengthened compositions before the period of David, and even then the writing of books was still a matter of rare occurrence. Besides, several writings of the Hebrews, held to be of ancient date, are believed to betray a later origin than is assigned to them by their contents, their mode of representation, and the character of the language; an uncertain period after the exile, of the older so that, in truth, we possess nothing which, in national alphabetic character, which was common its original shape, reaches further back than the above-mentioned age. Such being the case, we must recognise not only the internal arrangement, lat a good deal also of the contents of the Helvew writings, as a later elaboration. That criticism has discovered, as it believes, here and there traces of much later hands than those to whom tradition ascribes the authorship of the particular works, does not necessarily always throw discretize on the incidents narrated, nor destroy the value of that peculiar spirit by which they are characterised.

The composition of the extant works in Hebrew Literature proper would, on this view, extend over a period of nearly 900 years—viz., from the times of David to those of the Maccabees. This period was preceded by a preparatory one of sagas, songs, fragmentary historical notices, inscriptions, laws, and probably also priestly registers. The nature and contents of the particular writings are determined by the changing fortunes of the people, who were at first strong and flourishing; then disrupted and weakened; then held in subjection by Assyrian, Egyptian, Babylonian, Persian, Greek, and Syrian rulers; and, finally, once more independent under native princes. Nevertheless, the prevalent ideathe hasis, so to speak, of the whole Hebrew literature, looked at from the merely human point of view—is a passionate enthusiasm for independence, and for the preservation of a nationality founded on and for the preservation or a hazomatny ionusies on their law and history; hence its patriotism is of a porfoundly religious character. The law and the doctrine are the 'word of God,' the Hebrews are the 'people of God,' his 'chosen people,' their fortunes are, in quite a special sense, 'providences;' and their poetry has God or the nation for its con-stant theme. In a certain sense, therefore, as we might expect, all the productions of the Hebrew muse shew a marked similarity to each other; still they can be arranged, according to form and contents, under the five heads—law, prophecy, history, lyric poetry, and speculation. (For a special account of these, see the articles on the separate books of the Old Testament; also BIBLE, PENTATEUCH, &c.) The same cpoch in which took place the tran-sition from Hebraism to Judaism—the epoch of the captivity—was also that which marked the com-mencement of Jewish literature, properly so called. Founded on the earlier and more creative Hebrew, and for the most part written in the same language, it is yet qualified by the presence of religious conceptions borrowed from the Persians, of Greek wisdom, Roman law, and, at a later period, of Arabic poetry and philosophy, and of European science; though everything is strictly subordinated to the great ideas of the ancient faith. Since the return from exile, the Jewish-also, but erroneously, called the Rabbinical-literature has, without the slightest external encouragement, actively taken part in the cultivation of the human mind; and in the results of this activity, which are still far from being duly appreciated, there he concealed the richest treasures of centuries. Jewish literature has been divided chronologically into nine periods.

The first period extends to 143 n.c. After the return from exile, the Jewish people naturally enough became animated by an intense nationality of feeling: they had nearly lost name, country, life; and now that these were restored again, they stennously resolved never more to place them in jeopardy. Guided by Ezra, the intellect of the nation began to exhibit surpassing reverence for the Pentateuch and the Prophets. Expositions and additions to the earlier history (Midradsim), as well as Greek translations, were executed, and several of the Hagiographa—such as particular psalms, the so-called Proverbs of Solomon, Ecclesiastes, the Books of Chronicles, portions of Ezra and Nehemiah

were written. To this period also, if to any, must belong the uncertain performances of the Great Synonyque (q. v.), a body the existence of which has, as indicated above, been doubted by some early critics, but which is now established beyond any doubt. To this the work of completing the canon of the Oil Testament is chiefly ascribed. Towards proprid persond, as, for instance, Sirach and Aristobalus. The doctors of whom the Great Synagogue chiefly consisted were called Septem (Scribes), and the Aramaic finally became the popular dialect of Palestine.

The second period extends from 143 B.C. to 135 A.D. The Midrash (q.v.), or the inquiry into the meaning of the sacred writings, was divided into Halacha (q. v.) and Hagada: the former considered the improvement of the law, with a view to practical results; the latter, the essence of the religious and historical interpretations. At first, both were the oral deliverances of the Soferim, but gradually written memorials made their appear-ance. The public interpretation of the Scripture in schools and synagogues, the independence of the sanhedrim, the strife of sects, and the influences of Alexandrian culture, furthered this development. To this period also belong various Greek, but not, as is still erroneously supposed by some, the written Targuns or Aramaic Versions of the Bible (see TARGUMS), which sprang at a much later period from oral translations of the Pentateuch in the synagogues instituted after the return from the exile; further the whole of the Apocrypha (q. v.), and the earliest Christian writings, which are at least the productious of men nurtured in the principles of Judaism, and which contain many traces of Judaistic culture, feeling, and faith. It was also characterised by the drawing up of prayers, scriptural expositions, songs, and collections of proverbs. The poet (not the prophet) Ezekiel, the author of the first book of the Maccabees, Jason, Josephus, Philo, Johannes (see above), are names specially worthy of mention; so also are the doctors of the oral law-Hillel (q. v.), Shamai, Joehanan-ben-Saccai, Gamaliel, Eleazarhen-Hyrean, Joshua-ben-Chananja, Ishmael, Akiba. and others of like eminence. Rabbi (Master), Talmid Chacham (Disciple of Wisdom), were titles of honour given to those expert in a knowledge of the law. Besides the Maccabean coins, Greek and Latin inscriptions belonging to this period are extant.

The third period reaches from 135 to 475
A. n. Instruction in the Halacha and Hagada now became the principal employment of the flourishing schools in Galliec, Syria, Rome, and since 219 A.D., in Babylonia; the most distinguished men were the masters of the Michael (p. v.) and the Tubmad (p. v.)—viz., Elexar-hen-Jacob, Jehnda, Jose, Menr, Simono-ben-Sochal, Jehnda the Holy, Nathau, Chija, Ashe, and Ahina. Beades expositions, additions to Sirach, ethical treatizes, stories, fathes, and history were also composed; the prayers were curiched, the Targun to the Pentacuch and the Prophets completed, and the calendar fixed by Hillel the second, 340 A.D. After the suppression of the academies in Palestine, those of Persia—viz., at Sura, Pumbleditha, and Nahandea—became the centre of Jewish literary activity. On Salbathis and testal days, the people heard, in the schools and testal days, the people heard, in the schools discourses. Of the biblical literature of the Greek J., we have only fragments, such as those of the versions of Aquila and Symmachus. With this period terminates the age of direct tradition.

The fourth period (from 475 to 740 A.D.). By this time, the J. had long abandoned the use of Hebrew, and instead had adopted the language of whatever country they happened to dwell in. During the 6th c. the Babylonian Talmud was conabout a hundred years before. Little remains of the labours of the Jewish physicians of the 7th e., or of the first Geonim or presidents of the Babylonian schools, who first appear 589 A.D. On the other hand, from the 6th to the 8th centuries, the Masora was developed in Palestine (at Tiberias); and, besides a collection of the earlier Haggadas (e.g., Brreshith rabba), independent commentaries were likewise executed, as the Pesikta, the Pirke of Eliezer (700 a. d.), &c. See Midrash; Haggada.

In the fifth period (from 740 to 1040 A.D.), the Arabs, energetic, brilliant, and victorious in literature as in war, had appropriated to themselves the learning of Hindus, Persians, and Greeks, and thus excited the emulation of the oriental J., among whom now spring up physicians, astronomers, grammarians, commentators, and chroniclers. Religious and historical Haggadas, books of morality, and expositions of the Talmud, were likewise composed. The oldest Talmudic compends belong to the age of Anan (circa 750 A. D.), the earliest writer of the Karaite Jews. The oldest prayer-book was drawn up about 880 A.D.; and the first Talmudic Dictionary about 900 A.D. The most illustrious Geonim of a later time were Saadia (died 941 A. D.), equally famous as a commentator and translator of Scripture into Arabie, a doctor of law, a grammarian, theologian, and poet; Scherira (died 998), and his son Hai (died 1038), who was the author, among other things, of a Dictionary. From Palestine came the completion of the Masora and of the vowelsystem; numerous Midrashim, the Hagiographical Targums, and the first writings on theological cosmogony, were also executed there. From the 9th to the 11th e., Kairwan and Fez, in Africa, produced several celebrated Jewish doctors and Learned rabbins are likewise found in Italy after the 8th c .- e.g., Julius in Pavia, &c. Bari and Otranto were at this time the great scats of Jewish learning in Italy. After the suppression of the Babylonian academics (1040), Spain became the central seat of Jewish literature. Spain became the central seat of sewish heracure. To this period belong the oldest Hebrew codices, which go back to the 9th century. Hebrew rhyne is a product of the 8th, and modern Hebrew prosody of the 10th century.

The sixth period (from 1040 to 1204 A.D.) is

the most splendid era of Jewish medieval literature. The Spanish J. busied themselves about theology, exegetics, grammar, poetry, the science of law, astronomy, nathematics, philosophy, rhetoric, and medicine. They wrote sermous, and ethical and historical works. The languages employed were Arabic, Rubbinical Hebrew, and ancient or classical Hebrew. We can only mention here the great doctor, Samuel Halevi (died 1055), &c.; and lastly, the renowned Maimonides (q. v.), whose death closes this epoch. The literature of the French rabbins was more national in its character, and kept more strictly within the limits of the Halacha and Haggada. In Provence, which combined the literary characteristics of France and Spain, there were celebrated Jewish academies at Lunel, Narbonne, and Nimes, and we find Talmudists, such as Berahja Halevi, Abraham-ben-David, &c. The fame of the Talmudists of Germany, especially those of Mayence and Ratisbon, was very great. Among the most illustrious Jewish writers of this period, belonging to that country, are Simeon, the compiler of Falkat, Joseph Kara, Petachja, &c. Only a few

The greatest part of the Feast Day prayers was completed before Maimonides. Many of the works, however, produced between 740 and the close of this period are lost.

The seventh period (from 1204 to 1492 A.D.) bears manifest traces of the influence exercised by Maimonides. Literary activity shewed itself partly in the sphere of theologico-exegetic philosophy, partly in the elaboration of the national law. With the growth of a religious mysticism, there also sprung up a war of opinions between Talmudists, Philosophers, and Cabbalists. The most celebrated J. of this period lived in Spain; later, in Portugal, Provence, and Italy. To Spain belongs (in the 13th c.) the poet Jehuda Charisi, &c. In the 15th c., a decline is noticeable. Books written in Hebrew were first printed in Spain at 1xar in Aragon (1485), at Zamora (1487), and at Lisbon (1489).— During this epoch, the chief ornaments of Jewish literature in l'rovence were Moses-ben-Abraham, David Kimchi, Jeruham, Farissol, Isaac Nathan, the author of the Hebrew Concordance, In Italy, Jewish scholars employed themselves with the translation of Arabic and Latin works. Works of an asthetical character were written by Immanuelben-Solomon, the author of the first Hebrew sonnets ; Moses de Rieti, who wrote a Hebrew Divina Commedia, &c.-While France could shew only a Commetta, &c.—while France count shew only a few notable authors, such as the collectors of the Tosafot, Moses de Concy, and Jehiel-ben-Joseph, the poet and exegete Berachja, Germany produced a multitude of writers on the law, such as Eleazar Halevi, Meyer from Rothenburg, Asher, Isserlin, Lippmann. The most of the extant Hebrew MSS, belong to this period; but a great part of medieval Jewish literature lies unprinted in Rome, Florence, Parma, Turin, Paris, Oxford, Leyden, Vienna, and Munich.

The eighth period (1492 to 1755 A.D.) is not marked by much creative or spiritual force among the Jews. In Italy and the East (1492), in Germany and Poland (1550), in Holland (1620), Jewish scholars worked printing-presses, while nunerous authors wrote in Hebrew, Latin, Spanish, Portu-guese, Italian, and Judæo-German. Some of the most eminent theologians, philosophers, jurists, historians, mathematicians, poets, commentators, lexicographers, grammarians, &c., of this period were Isaac Abrabanel, Elia Misrachi, I. Arama, J. Chabib, Elia Levita, Obadio Seforno, Joseph Cohen, Gedalja Jahia, Sal. Usque, Asaria de Rossi, David de Ponti, David Gans, Isaac Troki, I. Luria, J. Karo, M. Alshech, M. Jafe, J. Heller, J. Aboah, Manasse b. Israel, Dav. Conforte, Leo de Modena, B. Musaphia, J. Eybeschütz, D. Oppenheimer, J. Emden, M. C.

Luzzatto, &c.

The ninth period extends from 1755 A.D. to the present time. Encouraged by the spirit of the 18th c., Moses Mendelssohn (q. v.) opened, to his co-religionists, a new era, which, as in the middle ages, first manifested itself in the national literature. Its character, contents, expression, and even its phraseology, were changed. Poetry, language, philology, criticism, education, history, and litera-ture have been earnestly cultivated. The sacred ture. Its character, contents, expression, and even books have been translated by them into the languages of modern Europe, and foreign works into Hebrew; and many of this once proscribed and detested race have taken an important part in the public and scientific life of Europe. Among the many illustrious names of this last period we can select only a few, like Ezechiel Landau, Elia Wilna, J. Berlin, Mendelssohn, Maimon, Bendavid, Mendez, Beer, Euchel, Bensev, S. Dubno, Creizenach, Zunz, of Futuri, Joseph Kara, resemps, as unanes belong to Greece and Asia; still the Karaite Jost, Geiger, Rappoport, Dukes, Zedner, Fürst, J. had a very able writer in Juda Hadassi (1148). Sachs, Steinschneider, Munk, Salvador, Reggio, &c. 11 _chiefly cultivators of literature with reference to

their own creed and nationality.

To enumerate names of those who were and are illustrious in general literature, in law, philosophy, medicine, philology, mathematics, belles lettres, &c., we cannot even attempt, since there is not one country in Europe which does not count J. among the foremost and most brilliant representatives of its intellectual progress. Of Germany—considered to be in the vanguard of European learning—Bunsen says that the greater part of the professors at its universities and academies are Jews or of Jewish origin (Neander, Gans, Benary, Weil, Benfey, Stahl, Dernberg, Valentin, Lazarus, Herz, &c., &c.) -certainly a most startling fact. Another extraordinary and well-authenticated fact is, that the European press, no less than European finance, which means the freest development of all the resources of soil and science for the gigantic enterprises of our day, are to a great extent in their power; while, on the other hand, names like Heinrich Heine, B. Börne, R. v. Ense, Berthold Anerbach, Henrik Herz, Jules Janin; Felix Mendelssohn-Bartholdy, Halévy, Meyerbeer, Moscheles, Joachim, Ernst, Rubinstein, Wieniawski, Grisi, Braham, Giuglini, Czillag, Costa; Rachel, Davison, Rott, Dessoir; Bendemann, &c.; besides hosts of others less familiar to English ears, who shine in all branches of art: music, sculpture, painting, the drama, &c., shew plainly how unjust is the reproach of their being an 'abstract' people, without sense for the bright side of life and the arts that embellish it. Briefly—they are, by the unanimous verdict of the historians and philosophers of our times, reckoned among the chief promoters of the develop-ment of humanity and civilisation. What has been their reward we have seen. Terrible has been the punishment for sins and shortcomings, real or imaginary, over which both Christians and Mohammedans have thought good, at different periods, to constitute themselves judges; and the most hideous spot in the history of the last 2000 years is the systematical but futile endeavour to sweep is the systematical but inthe endeavour to sweep the 'chosen race' from off the face of the earth. 'If there is a gradation in sufferings, Israel has reached the highest acme; if the long duration of sufferings, and the patience with which they are borne, ennobles, the Jews defy the high-born of all countries; if a literature is called rich which contains a few classical dramas, what place deserves a tragedy lasting a milleunium and a half, composed and enacted by the heroes themselves?' With these grand words of Zunz (Synagogale Poesse) we conclude our brief sketch: proudly pointing to the final triumph of humanity which belongs to our own day and generation.

JEWS, in point of law, are now, if natural-born subjects, on nearly the same footing as English subjects, the following peculiarities only being noticeable. By the 8 and 9 Vict. c. 52, they were allowed to hold offices in municipal corporations, on condition of signing a declaration (in place of the usual oaths) not to exercise their influence so as to injure or weaken the Protestant Church. By the statute 9 and 10 Vict. c. 59, they were placed, as regards their schools and places of worship, of education and charities, on the same footing as Protestant dissenters. Before 1845, doubts had prevailed whether the marriages previously celebrated in England among the J., according to their own usages, were valid, and the statute 10 and 11 Vict. c. 59 put an end to such doubts, by declaring all such marriages valid, provided both the parties married had been persons professing the Jewish religion. But now, as then, though it is competent for J., like other dissenters, to superadd any same name, and perhaps the handsomest and most

religious ceremony they please to their marriages, there must in all cases be notice given to the registrar of the district of such marriage being about to take place, the only exemption being that the marriage may be celebrated in the synagogue, and not, as in the ordinary case, in the superintendent registrar's office, or a registered building. A licence may also be procured from the superintendent registrar, and the secretaries of the respective synagogues are recognised as the persons to keep the register books of the Jewish marriages. In Scotland, there is no peculiar legislation affecting Jewish marriages. Lastly, by the statute 21 and 22 Vict. c. 48, s. 5, which substituted one oath for the oaths of allegiance, supremacy, and abjuration, an extension of the 8 and 9 Vict. c. 52 was made, to suit the case of the J. in all cases where the declaration set forth by 9 Geo. IV. c. 17 requires to be taken. The result is, that not merely as regards municipal offices, but all other offices, where the same declaration is required, a Jewish subject is entitled to be admitted on making the declaration substituted by 8 and 9 Vict. c. 52. Moreover, the complete emancipation of the J. may be said to have been attained by the statute 21 and 22 Vict. c. 49, which enables either House of Parliament, when a Jew would be entitled. but for the oath of allegiance, to sit and vote in the House, to modify that eath by emitting the words, and I make this declaration upon the true faith of a Christian.' When these words are omitted, a Jew has no longer any conscientious objection to take the oath, and so is practically admitted, like other subjects, to become a member of either House of Parhament. It is, however, still in the discretion of either Honse to refuse to make the resolution to omit those words, so that J. have not an absolute right to admission, though practically it is not likely that the admission will in future be refused, at least by the House of Commons. The same act specially excludes J. from holding or exercising the office of guardians and justices of the United Kingdom, or of Regent of the United Kingdom, or of Lord High Chancellor, Lord Keeper or Lord Commissioner of the Great Seal of Great Britain or Ireland, or the office of Lord Lieutenant or deputy, or other chief governor or governors of Ireland, or Her Majesty's High Commissioner to the General Assembly of the Church of Scotland. Whenever a Jew holds any office in the gift of Her Majesty, to which office shall belong any right of presentation to any ecclesiastical benefice, such right of presentation shall devolve upon the Archbishop of Canterbury for the time being.

JEWS-HARP (Fr. jcu, a toy?), a very simple musical instrument, made of metal. When played on, it is held between the teeth, and the sound is produced by the inhaling and ejecting of the air from the lungs, while at the same time an elastic tongue or spring, which is fixed in the middle of the frame, is set into vibration by being twitched by the finger. It is a pretty old invention, and is mentioned by Prätorius in his Organographia, in 1619, under the name of Crembalum. The best Jews-harps are made in Riva, a town in the Italian Tyrol. The first performer of any celebrity on the Jews-harp was a Prussian soldier, under Frederick the Great, called Koch. In modern times, Kunert, Amstein, and others, were famous for using a variety Amstein, and others were rained; and their performances were so wonderful, that, like other artists, they travelled over Europe, and appeared at public concerts with great success.

JEWS' MALLOW. See Corchorus. JEWS' THORN. See JUJUBE and PALIURUS. JEYPOO'R, capital of the protected state of the

regularly built of the native towns of India, stands about 850 miles to the north-west of Calcutta, in lat. 26° 56' N., and long. 75° 55' E. The place is a rectangle of two miles by one, being subdivided by centre. Besides numerous temples and mosques, there are an arsenal and an observatory. - The state of Jeypoor is situated in Rajpootana, contains 15,251 square miles, and nearly 2,000,000 inhabitants.

JHA'NSI, a fortified town in Bundelcund, stands in lat. 25" 28' N., and long. 78° 38' E. It carries on a considerable trade, being on the main route between the Deccan and the Doab. During the revolt of 1857, the native garrison murdered all the Europeans, men, women, and children, not leaving one to tell the tale. In the following April, the place was recovered, with enormous loss on the part of the insurgents, by a detachment of the Bombay army under Sir Lie, h Rose,—The state of Jhansi has an area of about 2500 square miles,

and a pop. of 200,000.

JHE'LUM, the ancient Hydaspes, one of the rivers of the Punjab. It rises in Cashmere, which forms its upper basin, and is navigable within that country for about 70 miles. On emerging from the Himalaya through the Baramula Pass, it again of 490 miles, it joins the Chenab, in lat. 31 10 N. long, 72° 9' E., and forms with it what is sometimes called the Trimah or Trimab. The banks of this river were the scene of the battle between Alexander the Great and Porus. The river waters the towns of Islamabad, Shahabad, Srinagur, Jelalpur, and Pind Dadun Khan.

JIB a triangular sail borne in front of the foremast in all vessels. It has the bowsprit for a base in schooners and vessels of a smaller class, and the jib-boom in larger vessels, and exerts an important

fore-topmast staysail, set on fore-topmast stay;
 jib:
 flying jib;
 bow-prit:
 jib-boom;
 flying jib-boom;
 martingale, or dolphin-atriker;
 fore-course.

effect, when the wind is a-beam, in throwing the ship's head to leeward. The flying jib has the flying jib-hoom for a base. When a fore-course is not used, an additional jib-shaped sail, called the foresail, is spread on the fore-stay.

JIB-BOOM, an extension of the bowsprit of a ship towards the front, running out beyond it, by a cap and irons, as does the topmast above the lowermast. It gives greater spread for jib-sails, and a more extended base for the top-gallant-mast-stay. In large vessels, a flying jih-boom is run out in a similar manner beyond the jib-boom.

JIBING. See Gyring.

JIDDAH, or JEDDAH, a trading town of the Hedjaz, Arabia, is situated on an eminence rising from the eastern shore of the Red Sea, about 60 miles west of Meeca, of which city it is the port, J. is an unhealthy town; it suffers greatly from want of water, and is surrounded by a desert. It has, however, long been the great commercial centre of Arabia. It imports corn, rice, butter, centre of Arabia. It imports corn, rice, outcer, and other natural productions from Egypt and Abyssinia, manufactures from India, and slaves from the Malay Archipelago. Coffee is largely exported. It is inhabited by a function population, wane, owing to the numbers of pilgrims to Mecca who are constantly pouring through it. On the 15th June 1858, the inhabitants rose against the Christians resident among them, and massacred a considerable number of them. In August of the same year, the town was bombarded by the British, and satisfaction rendered. The population fluctuates between 10,000 and 20,000 and upwards. JIG. See GIGG.

JIGGER, See CHIGOE.

JIGGER, on board ship, an apparatus consisting of a strong rope with a block at one end, and a sheave at the other, used in maintaining the tension of-or, technically, in 'holding on' to-the cable as it is thrown off from the caustan or windlass, round which it only takes two or three turns,

JITOMI'R, chief town of the government of Volhynia, in European Russia, is situated on the river Teterev, an affluent of the Duieper, in lat. 50° 15′ N., long. 28° 40′ E.; distance from St. Petersburg, 802 miles; pop. in 1863, 38,407. Its foundation is traced back as far as the 10th c., and it was at one time an important stronghold against the invasions of the Cossacks. In 1642, it was nearly destroyed by the Cossack chief Khmelnitzky. In 1793, it was annexed to the Russian empire, as town carries on a trade in leather, wax, honey, and tallow, has four annual fairs, carries on iron and glass works, and extensive cloth manufactures.

JOAN, POFF, the name of a supposed female occupant of the papal chair in the 9th century. The popular story represents this singular personage as of English parentage, but educated at Cologne, Rome, and ultimately Athens, in all which places in the assumed character of a man, and under the name of Jounnes Anglicus, 'John of England,' she is alleged to have attained great distinction as a scholar. The narrative adds, that having come in the end to Rome, she had ability and adroitness enough to carry the deception so far as to obtain holy orders, and to rise through various gradations to the papal sovereignty itself; but that being nevertheless of immoral life, the fraud was at length discovered, to the infinite scandal of the church, by her becoming pregnant, and being seized with the pains of childbirth on occasion of a public procession. The story had obtained currency, certainly, in the latter part of the 13th century. It was inserted, though discredited, by Platina in his Lives of the Pones, but the statement does not appear to have been much discussed until the 16th c., when the commentator of Platina, Panvinius, inserted a note in refutation of it. Later Roman Catholic historians of course have published replies to the objections against the papal succession which their adversaries drew from the story of the female pope; but it is curious that the most complete und

elaborate investigation of the question was that of a Calvinist divine, Blondel, who demonstrated the historical groundlessness of the story. He was iollowed on the same side by Leibuitz; and although attempts have been made from time to time by a few writers to maintain the tale, it has been all but universally discarded, its latest patron being Professor Kist of Leyden, who, but a few years since, devoted an elaborate essay, Verhandeling over de Pausiu Joanna, to the subject. A few words will suffice to explain the state of the historical evidence. The place assigned to the supposed papess is between the historical popes Leo IV. and Benedict III., the latter of whom died March 10, 858. It is alleged latter of whom thed March 10, 858. It is alleged that the Joan of the story occupied the papal chair for two years and five months. Now, according to all the chroniders, with the doubtful exception of Marianus Scotus, Lee IV, did not die till July 10, 853, so that the interval between his death and that of Nicholas I., the successor of Benedict III., would be entirely filled up by the two years and tive mouths of the papess, and no room would be left for the undoubted pontificate (of two and a half years) of Benedict III. Further, Hinemar of Rheims, a contemporary, in his 26th letter to Nicholas I., states that Benedict III. successed Leo IV. immediately. It is proved, moreover, by the unquestionable evidence of a diploma still preserved, and of a contemporary coin which Garampi has published, that Benedict IIL was actually reigning before the death of the Emperor Lothaire, which occurred towards the close of \$55. The earliest authorities for the story of Pope J., not reckoning a more than doubtful MS of Marianus Scotus, are Martinus Polonus, a writer of the latter part of the 12th c., and a writer named Stephen de Bourbon, who wrote about 1225 .- See Gieseler's Kirchengeschichte, th. ii. b. ii. s. 5; also Wensing, Over de Pausin Joanna-in reply to Kist-(S'Gravenhage, 1845); and Bianchi Giovini's Esame Critico degli atti relativi alla Papessa Giovanna (Milan, 1845).

JOAN OF ARC (Fr. JEANNE DARC), the MAID OF ORLEANS, was the daughter of respectable peasants, and was born in 1412, in the village of Domremy, in the department of Vosges, France. She was taught, like other young women of her station in that age, to sew and to spin, but not to read and write. She was distinguished from other girls by her greater simplicity, modesty, industry, and piety. When about thirteen years of age, she believed that she saw a flash of light, and heard an unearthly voice, which enjoined her to be modest, and to be diligent in her religious duties. The impression made upon her excitable mind by the national distresses of the time, soon gave a new character to the revelations which she supposed herself to receive, and when fifteen years old, she imagined that unearthly voices called her to go and fight for the Dauphin. Her story was at first rejected, as that of an insane person; but she not only succeeded in making her way to the Dauphin, but in persuading him of her heavenly mission. She assumed male attire and warlike equipments, and with a sword and a white banner, she put herself at the head of the French troops, whom her example and the notion of her heavenly mission inspired with new enthusiasm. On 29th April 1429, she threw herself, with supplies of provisions, into Orleans, then closely besieged by the English, and from the 4th to the 8th of May, made successful sallies upon the English, which resulted in their being compelled to raise the siege. After this important victory, the national ardour of the French was rekindled to the utmost, and Joan became the dread of the previously triumphant English. She conducted never was, and never was created, but is an allegory."

the Dauphin to Rheims, where he was crowned. 17th July 1429, and Joan, with many tears, saluted him as king. She now wished to return home, deeming her mission accomplished; but Charles importuned her to remain with his army, to which she censented. Now, however, because she no longer heard any nucerthly voice, she began to have fearful forebodings. She continued to accompany the French army, and was present in many con-flicts, till, on 24th May 1430, she threw herself, with a few troops, into Compiègne, which the Burgundian forces besieged; and being driven back by them in a sally, was taken prisoner, and sold by the Burgundian officer to the English for a sum of 16,000 francs. Being conveyed to Rouen, the headquarters of the English, she was brought before the spiritual tribunal of the Bishop of Beauvais as a sorceress and heretic; and after a long trial. accompanied with many shameful circumstances, she was condemned to be burned to death. She recanted her alleged errors t the stake, and expressed penitence, in the hope of having her punishment commuted into perpetual imprisonment. But this did not accord with the views of those in whose power she now was. Words which fell from her when subjected to great indignities, and her resumption of male attire when all articles of female dress were carefully removed from her, were made grounds of concluding that she had relapsed and she was again brought to the stake, on 30th May 1431, and burned. Her family, who had been ennobled apon her account, obtained, in 1440, a revisal of her trial; and in 1456, she was formally pronounced to have been innocent.

Few facts in history seem better authenticated than the death of 'the Maid' at Rouen in 1431, and yet grave doubts have been raised on the point, There was a popular belief at the time that some one had been executed in the place of Joan; and many pretended Maids appeared, who, however, were punished as impostors. But a Father Vignier, in the 17th c., found among the archives of Metz a paper purporting to be written at the time, and paper purporting to be written at the time, among giving an account of the arrival at Metz, on the 20th May 1436, of the Maid Jeanne, who was at once recognised by her two brothers, and was subsequently married to a Steur de Hermoise. Vignier afterwards found in the family muniment-chest of a M. des Armoise, in Lorraine, a contract of marriage between 'Robert des Armoise, Knight, with Jeanne D'Arcy, surnamed the Maid of Orleans.' In addition to this, there was found, in 1740, among the archives of the Maison de Ville of Orleans, under the dates 1435, 1436, a record of certain payments to a messenger bringing letters from Jeanne the Maid, and also to her brother John du Lils or Lys. (De Lys was the name by which the family of Darc was ennobled.) A subsequent entry, 1st August 1439, records a gift on the part of the council of the city for services rendered by her at the siege. M. Delepierre, who has discussed the subject in his Doute historique (privately printed, 1855), adduces various other facts tending to the same

JOB [Heb. Juob, derived by Gesenius from avab. 'to be an adversary;' hence (passive) 'one who has an adversary,' or 'a persecuted one'], the leading personage in one of the canonical books of the Old Testament, which is called after him. He is said to have lived in the land of Uz (Sept. Ausitis. cf. Ptol. v. 19. 2), a locality somewhere between Idumea, Palestine, and the Euphrates. Whether Job was a real or a fictitious personage, has been discussed with superfluous animation by critics. The Talmud (Baba Bathra, xv. 1) holds that ' Jjob

The belief of most scholars at present is, that the Book of Job is a great dramatic poem, built on a Book of 300 is a great dramate pseun, outcom a basis of historical tradition. Job is a real person in precisely the same sense as the Hamlet of Shakspeare is a real person; i.e., for each there is a certain genuine groundwork of antique fact; hut some of the incidents, together with the sentiments and speeches recorded, are purely imaginative, Who was the author, and when he lived, cannot be, or at any rate has not been, determined with exactitude. Some eritics make him anterior to Moses; the LXX, identifies him with 'Jobab, king of Edom' (Postser, to Job); others, among whom are many of the Talmudical authorities, regard Moses himself as the author. The Mosaic period is claimed for it by Saadia, many of the church fathers, Michaelis, Jahn, Hufnagel, &c. A nearer is the view held by Gregory Nazianzen, Luther, Döderlein, and others, who assign the work-which shews a certain affinity with the Proverbs-to the age of Solomon, when Hebrew poetry was in its full bloom, and a broad catholic spirit pervaded the nation; some have even given Solomon himself the credit of its composition. The reference to the and while certain passages in Ezckiel, Jeremiah, Isaiah, Amos, which point to an acquaintance with it, go far to prove its comparatively early existence, Rénan, a recent French critic, considers that it belones to the first half of the 8th c. B. C. : Ewald pronounces for a later period, and assigns the poem to the beginning of the 7th century. This date is also advocated by Dr Sanuel Davidson in his Introagain-among whom are Clericus, Grotius, Gesenius, Umbreit, Knobel, De Wette, &c. -place it in the period of the exile; Hartmann, Vatke, Reier, and others, in the 5th Christian century,

The earlier German scholars, Herder, Eichhorn, &c., looked upon the author as an Edomite - not a entirely, abandoned. The poem is a genuine product of the Hebrew muse, not, however, standing on narrow national ground—the very scene be ug laid in a foreign country -but on the broad ground of universal humanity :- it is the attempt of a

Our space will not allow us to enter minutely into cuss the various theories which have been advanced, According to Dr Davidson, it was 'to demonstrate the insufficiency of the current doctrine of compensation.' It condemns the notion that there is a necessary connection between sin and suffering, and without explaining the cause of the latter in the It exhibits a noble spirituality; and in several places, the mysterious contradictions of life seem to awaken in the soul of the writer thoughts of another life beyond the grave, in which God will vindicate the righteousness of His ways. As a work both of genius and art, it occupies well-nigh the first rank in Hebrew literature, and is unsurpassed in sublimity of imaginative thought by any poem of antiquity. The language is elaborate and artificial in the highest degree, yet grandly dramatic construction of the poem indicates the same thing. It has a prologue and epilogue; the

of three speeches by Job's friends, with three replies by Job himself, which, by a little stretch of fancy, we may describe as separate scenes. The poem (properly so called) opens and closes with a monologue by the author of the piece. The different character of the persons introduced is skilfully observed; their words have a rhythmic flow; and the dia-logues are even strophically divided (see Ewald, Dan Buch Jjob übernetzt und erklärt, Zweite Auflage, 1854). The integrity of the poem in its present form has been strongly questioned by many critics; the inferiority (in a literary and poetic point of view) of the passages containing the speeches of Elihu (xxxii.-xxxvii.), no less than the nature of the prologue and epilogue, are thought to indicate that these passages are the work of a later hand. Compare the commentaries of Schultens, Bertram, Eichhorn, Rosenmüller, Ewald (with translation), Umbreit, De Wette, Hirzel, Stickel, Schlottmann, Régan (with an admirable translation into French), Lec, &c.

JOB'S TEARS (Coix lackruma), a corn-plant of India. It is a grass, sometimes rising to the height of eight feet, with the stout habit of maize, to which also it is botanically allied; but the male and female flowers grow close together in spikelets, which are produced in axillary clusters. The name is derived from the tear-like form of the hard, shining, bluish-white seeds, which are sometimes made into bracelets and necklaces, and are also an article of fined. This plant is cultivated to some extent in many parts of ludia, but it is one of the worst of the cereals. It has become almost naturalised in Spain and Portugal, and flour made from it is there used, but it is chiefly a resource of the poor in times of scarcity.

JODELN, a peculiar manner of singing with the falsetto voice in harmonic progressions, which exists only among the Tyrolese and the Swiss.

JOEL (Jehovah is God), the son of Pethuel, one of the twelve Minor Prophets, who delivered his predictions, according to some, in the days of Joash; others, however, place him variously, in the time of Hezekiah, Manasseh, Josiah, Uzziah, &c. Converning the circumstances of his life, absolutely nothing is known. The occasion of his prophecy was an extraordinary plague of locusts, accompanied by an extreme drought, which consumed the land. After describing these judgments, the prophet calls upon his countrymen to repent, and assures them that God is ready to forgive. Extraordinary warmth and tenderness of feeling, together with an enthusastic belief in the glory of the future destiny of the people, run through the whole of the book. Some as predictive of the blessings of the Messianic age, and one is actually applied by the apostle Peter to the events which transpired on the day of Pentecost (Acts, ii. 16 21). The style of J., always vivid and eloquent, sometimes sublime, is perhaps the very finest of any of the writers of the Old Testament. One of the most elaborate works on J. is Credner's Der Prophet Joel. Compare also Ewald, Umbreit, Henderson, &c.

JO'GGLE, in Masonry, is a notch or curve in the

joints, adopted in fitting stones together, so as to may be termed, acts; each of these, again, consists prevent them from slipping. Fig. 1 is a common

form. The joggle-joint is commonly used in straight ally named Octavianus, and on the death of Pope arches for this purpose, as in fig. 2. Joggles are joints are required to resist

water, &c. Sometimes the joggle consists of a piece of hard stone let into a groove eut in both the stones form-

ing the joint (see fig. 3). JOHA'NNA, one of the Comoro Islands (q. v.).

JOHN, the Apostle and Evangelist, was the son of Zebedee, a fisherman of the Sea of Galilee, and of He was born at Bethsaida, and, till he was called by Jesus to be his disciple, seems to have followed his father's occupation. The events of his life, from this time to the ascension of Christ, are to be learned from the gospels. After the out-pouring of the Spirit on the day of Pent-cost, he appears to have laboured for the spread of the Gospel first in Jerusalem and Samaria, and afterwards to have had his residence chiefly in Ephesus. During the reign of the Emperor Domitian, he was driven by persecution to the isle of Patmos, but returned to Ephesus under Nerva, and died there at a great age. The dates assigned to this event range from S9 to 120 A.D., and in any case he must have long survived his brother apostles. It is believed that he was the only one of our Lord's apostles who died a natural death. Tradition accounts for this by representing his life as miraculously preserved. He is represented in Scripture as of a peculiarly affectionate nature, 'the disciple whom Jesus loved;' and tradition makes his last words to have been, 'Little children, love one another.' The works attributed to him are the Gospel, the three Epistles of St John, and the book to spec, the three Epistus of 0.50m, and the book of Revelation. The first is generally believed to have been written by the apostle at Ephesus about 75 A.D., but attempts have been made by modern writers to disprove both its Johannine authorship and its early origin. The Tübingen school, headed by Baur, place its composition in the middle of the 2d c., and assert that it obviously the middle of the 2d c., and assert that a bovolary rose out of the conflicts of opposing teachers. This view, however, is rejected by the greatest crities and scholars of Germany, and its Johannine origin is now admitted. The three so-called Epistles of St John do not stand on exactly the same footing. lt is highly probable that the First proceeded from the same writer who composed the Gospel. In style, language, and doctrine, it is identical with it, and from the enrilest times it was quoted as a work of the Apostle John's; hut the Second and Third are classed by Eusebius among the Antilegomena (Scriptures of doubtful genuineness), and were suspected by the most learned and critical of the early Fathers. For an account of the Book of Revelation, see REVELATION, BOOK OF.

JOHN, the name of a long line of popes, the number of whom is variously stated by different historians, owing to some uncertainty as to the designation of two of the popes in the series-John VIII. (872-882), who is styled the IX. by some writers, who, accepting the story of Pope Joan (q.v.), reekon her as John VIII.; and John XV. (985—996), who is also called XVI. by those who place before him another John who died within a few days of his election. Without entering into this question, it will suffice to say that the last of the line of popes called John is John XXIII. The following appear to deserve some special notice.—John XII. was the son of Alberico, and

Agapitus, in 956, being elected pope through the lawless intrigue or violence of the dominant party, when only in his 19th year, was the first in the papal line to originate the now familiar practice of changing his name. His life, according to accounts which it is impossible to discredit, was what might be expected from such antecedents, scandalous and disorderly; and although he had crowned Otho emperor and king of Italy in 962, that monarch, in 963, in a symod of the clergy, overstepping all the ordinary rules of canonical procedure and legal precedent, caused sentence of deposition for seandalous life to be pronounced against John, and Leo VIII. to be elected in his stead. John, however, re-entered Rome in the following year with a strong party, and drove out Leo; but his eareer was cut short by a dishonourable death. He was killed, according to Luitprand, while prosecuting an unlawful intrigue in 964. In his effeminacy or licentiousness, Panvinius and other historians find the origin of the fable of Pope Joan. - John XXII. is one of the most celebrated of the popes of Avignon. His family name was James de Cahors, and he was elected pope in 1316, on the death of Clement V. Attempting to carry out, in very altered circumstances, the vast and comprehensive policy of Gregory VII. and Innocent III., John interposed his authority in the contest for the imperial erown between Louis of Bayaria and Frederick of Austria. by not only esponsing the cause of the latter, but even excommunicating his rival. The public opinion, even excommunicating his rival. And the papacy however, and the political relations of the papacy founded upon it, had already begun to change. diet of Frankfurt refused to obey, and a long contest ensued, not only in Germany, but also in Italy, ensued, not only in Germany, but also in Iraly, where the Gueiph or papal party was represented by Robert, king of Naples, Frederick of Sicily being the chief leader of the Ghiledlines. The latter was placed by John under the same ban which had already been proclaimed against Louis; but in 1827, aiready been proclaimed against Louis; but in 1821, Louis came to Italy in person, and having been erowhed at Milan with the iron crown, advanced upon Rome, expelled the rupal legate, and was erowned emperor in the church of St Peter's by two Lomhard bishops. Inmediately on his corona-tion, he preceded to hold an assembly, in which he caused the pope sucher his original anniverse James de Cahors, to be thrice summoned, to answer a charge of heresy and breach of fealty; after which he caused him to be deposed, and Peter de Corvara, a monk, to be elected pope, under the name of Nieholas V. These measures, however, were attended with little result. Louis returned to Germany, and the Guelphic predominance at Rome was restored, the papal representative resuming his authority. But John XXII. never personally visited Rome, having died at Avignon in 1334, when, although without incurring the suspicion of personal aggrandisement, he had accumulated in the papal treasury the enormous sum of 18,000,000 florins of gold. This pope is remarkable in theological history as the author of that portion of the canon law called the Extravagantes, and also as having held the singular opinion, that the just will not be admitted to the beatific vision until after the general resur-This opinion he formally retracted before rection. his death.

JOHN, surnamed LACKLAND, king of England, and the youngest of the five sons of Henry II. by his wife, Eleanor of Guienne, was born at Oxford, 24th December, 1166. His father having obtained a ball from the pope authorising him to invest one of his sons with the lordship of Ireland, J. was proper JOHN ALL was the son of Americo, and a som from the pope authorising min to anyest one grantson of the notorious Marcoia, who, during of his sons with the horiship of Ireland, J. was the postificate of John X. (913—927), ruled with appointed in a council held at Oxford in 1178, and almost apprene power at Roue. John was origin- in March, 1188, he went over to take the twints of the property of the proper government, but governed so badly that he was recalled in the following December. J. latterly united with his brothers in their rebellions against their father, and it was the sudden communication of the news of his having joined his brother Richard's rebellion that caused the death of Henry. When Richard I. succeeded to the erown, he

conferred upon his young brother earldoms which amounted to nearly one-third of the kingdom. This did not, however, prevent J. endeavouring to seize the crown during Richard's captivity in Austria. J. was, however, pardoned, and treated with great elemency, and is said to have been nominated his successor by his brother on his deathbed. J. hastened, at his brother's death, to obtain the support of the continental barons, and then started for England, and was crowned at West-minster on 26th May 1199. Arthur, the son of his elder brother Geoffrey, was lineally the rightful heir to the crown, but at this time the law of primogeni-ture was but imperfectly established. The claims of Arthur were supported by Anjou and the king of France, but J. bought off the latter influence. J. now obtained a divorce from his first wife, Hadwisa of Gloucester, and married Isabella of Angoudême. In the war which ensued, Arthur, who was again assisted by France, was taken prisoner, and confined in the castle of Rouen, where there is every reason to believe that he was privately put to death; but the English monarch lost Normandy, Touraine,

Maine, and Anjou.

J. now quarrelled with the pope, and the kingdom was placed under an interdict; while J., in return, confiscated the property of the clergy who obeyed the interdict, and banished the bishops. Otherwise, too, he displayed considerable activity. He compelled William, king of Scotland, who had joined his enemies, to do him homage (1209), and joined his elements, to do him nomage (1299), put down rebellion in Ireland (1210), and subdued Llewellyn, the independent prince of Wales (1212). The pope now, in 1213, solemnly deposed J., and alsolved his subjects from their allegdance, and commissioned Philippe Auguste to execute his commissioned Philippe Auguste to execute his sentence. J., denounced by the church, and hated for his eruelty and tyranny by his subjects, found his position untenable, and was compelled to make abject submission to Rome, and hold his kingdom as a fief of the papacy. Philippe proceeded with his invasion scheme, though no longer approved by Rome : but the French fleet was totally defeated in the harbour of Damme, 300 of their vessels being eaptured, and above 100 destroyed. Subsequent events, however, proved more favourable to France, and at length the English barons saw the opportunity to end the tyranny of J.: they drew up a petition, which was rejected by the king, and this was the signal for war. The army of the barons assembled at Stamford, and marched to London; they met the king at Runnymede, and on the 15th June 1215 was signed the Great Charter (Magna Charta), the basis of the English constitution. The pope soon after annulled the charter, and the war broke out again. The barons now called over the dauphin of France to be their leader, and Louis landed at Sandwich on 30th May 1216. In attempting to cross the Wash, John lost his regalia and treasures; was taken ill, and died at Newark Castle, on 19th October 1216, in the 49th year of

JOHN, BAPTIST JOSEPH FABIAN SEBASTIAN, Archduke of Austria, a distinguished Austrian prince and general, was born 20th January 1782, and was the sixth son of the Emperor Leopold II. His mother was the Infanta Maria Louisa, daughter 1800, he received the command of the defeated Austrian army, formerly under Kray. His military career was not brilliant. He was defeated at Hohenlinden in 1800, and at Austerlitz in 1805. In the war of 1809, he advanced with an Austrian army into Italy, defeated the viceroy Engène at Sacile, and made his way as far as the Adige, when the reverses of the Austrian forces at Landshut. Eckmühl, and Ratisbon compelled him to retire. His love of natural science, for which be manifested an early predilection, continued undiminished amidst all the vicissitudes of his life; and Austria is indebted to him for many valuable scientific institutions and enterprises. Living in political retirement, he shewed a warm interest in every improvement and public work, and became exceedingly popular; so that when the German national congress assembled after the commotions of 1848, he was called by a great majority of voices, on the 29th of June of that year, to be Vicar or Regent of the Germanie empire. The fall of Metternich had also, in the meantime, released him from his political isolation in Austria; and the Emperor Ferdinand had placed him at the head of affairs there, and intrusted to him the opening of a constitutional assembly in Vienna. his high office as Regent, the archduke acted on strictly constitutional principles; but the progress of events being unfavourable to the Austrian interests, he resigned his office on 20th December 1849, and returned to Grätz, where he lived, as formerly, in retirement till his death, May 10, 1859. His marriage was one of an unusually romantic

kind. Late on a January evening in 1827, he had occasion to require the services of the postmaster of Aussee, a mountain-village in the vicinity of Grätz. The postmaster was from home; but his daughter, Anna Plochel, volunteered to drive him over the hill to his destination. The conversation and spirit of this maiden seem to have charmed the archduke, and within three weeks he married her. The titles of Countess of Meran and Baroness of Brandhof were subsequently conferred upon this

lady. See Morganatic Marriages.

JOHN, PRESTER ('Priest John'), the supposed Christian king and priest of a medieval kingdom in the interior of Asia, the locality of which was vague and undefined. In the 11th and 12th eenturies, the Nestorian missionaries penetrated into Eastern Asia, and made many converts among the Keracit or Krit Tartars, including, according to report, the khan or sovereign of the tribe, Ung (or Ungh) Khan, who resided at Karakorum, and to whom the afterwards celebrated Genghis Khan was tributary. This name the Syrian missionaries was trontary. This name the systam missionance translated by analogy with their own language, converting Ung into 'Jachanan' or 'John,' and rendering Khan by 'priest.' In their reports to the Christians of the West, accordingly, their royal convert figured as at once a priest and the sovereign convert nighted as at once a price and the solutions of a rich and magnificent kingdom. Genghis Khan having thrown off his allegiance, a war ensued, which ended in the defeat and death of Ung Khan in 1202; but the tales of his piety and magnificence long survived, and not only furnished the material of numberless medieval legends (which may be read in Assemani's Bibliotheca Orientalis, III, ii. 484), but supplied the occasion of several of those missionary expeditions from Western Christendom, to which we owe almost all our knowledge of medieval eastern geography. The reports regarding Ung Khan, carried to Europe by the Armenian embassy to Eugene 111., created a most profound impression; and the letters addressed in his name, but drawn up by the Nestorian missionaries, to the pope, to the kings of France and Portugal, and to the Greek of Charles III. of Spain. He early gave proof kings of France and Portugal, and to the Greek of considerable talent for military affairs; and in emperor, impressed all with a lively hope of the

speedy extension of the gospel in a region hitherto regarded as hopelessly lost to Christianity. They are printed in Assemani's Bibliotheca Orientalis. The earliest mention of Prester John is in the The earnest mention of reserve John is in the narrative of the Franciscan Father, John Carpini, who was sent by Pope Innocent IV. to the court of Batû Khan of Kipitchak, the grandson of Genghis Khan. Father Carpini supposed that Prester John's kingdom lay still further to the east, but he did not prosecute the search. This was reserved for not prosecute the search. This was reserved for a member of the same order, Father Rubruquis, who was sent as a missionary into Tartary by St Louis, and having reached the camp of Bata Khan, was by him sent forward to Karakorum, the seat of the supposed Prester John. He failed, however, of his hope of finding such a personage, the Khagan of Karakorum, Mangu, being still an unbeliever; and his intercourse with the Nestorian missionaries. whom he found established there, satisfied him that the accounts were grievously exaggerated. His narrative, which is printed in Purchas's Collection, is one of the most interesting among those of the medieval travellers. Under the same vague notion of the existence of a Christian prince and a Chris-tian kingdom in the East, the Portuguese sought for traces of Prester John in their newly-acquired Indian territory in the 15th century. A similar notion prevailed as to the Christian kingdom of Abyssinia, which, in the hope of finding Prester John, was visited so late as the reign of John II. of Portngal (1481—1495) by Pedro Covilham and Alfonzo di Payva, the former of whom married and acttled in the country. See Gieseler's Kirchen-geschielte, III. iii. 43; Ritter's Erikunde, th. ii. b. i. 250–283.

JOHN, St, the commercial capital and largest city of New Brunswick, stands on the north or left bank of the estuary of the river of its own name, in lat. 45° 14' N., and long 66° 3' W. Pop. in 1861, 27,317. The harbour, which is protected by batteries, is good, and accessible to the largest ressels at all seasons of the year. Ship-building and the timber-trade are the chief branches of industry; 435,661 tons of shipping were entered at this port in 1861.

JOHN, St, the most considerable river of New Brunswick, in British North America, rises in a Brunswick, in British North America, rises in a lake of the same name in the state of Maine, and after a south-east course of 450 miles, the last 225 of which are within British territory, it falls into the Bay of Fundy by an estuary five miles in width. Kear the sea, it is navigable for large vessels; while for craft of 120 tons it is practicable as far as Prederictor, which is 80 practicable as far as Fredericton, which is ou miles from its mouth, and the seat of the colonial government. The stream is of some historical interest in connection with the long-contested adjustment of the international boundary. Through most of its upper course, it separates Maine from

JOHN III. (John Sobiesel), king of Poland, 1674—1696, one of the greatest warriors of the 17th c., was born in 1624, or, according to others, in 1629, and educated with the utmost care, along with his brother Mark, by his father James Sobieski, Castellan of Cracow, a man of virtuous character and warlike spirit. The brothers travelled in France, England, Italy, and Germany. Their father's death recalled them home in 1648. The Poles were defeated by the Russians in the battle of Pilawiecz. The Sobieskis took up arms to restore the fortunes of their country. Mark fell restore the fortunes of their country. Mark fell it stood on the beach at the month of the Pentland in battle on the banks of the Bog; John distin- Firth, and was probably built for the reception of guished himself by his valour, and became the travellers crossing the ferry to the Orkneys. Traditional results of his countrymen and the dread of tion gives a more romantic origin. In the reign of

the Tartars and Cossacks. He received the highest military dignities and appointments, and on 11th November 1673, defeated the Turks in the great battle of Choczim, in which they lost 28,000 men; after which he was, on 21st May 1674, unanimously elected king of Poland, and was crowned in Cracow along with his wife, Maria Casimir Louisa, daughter of the Marquis Lagrange d'Arquien, and widow of the woiwode John Zumoiski. When the Turks besieged Vienna in 1683, John hastened thither with 20,000 Poles, and, along with the German auxiliaries who had also come up, raised the siege by the victory of 12th September of that year. In this battle, he took the banner of Mohammed, which he sent to the pope. On his entrance into by the inhabitants. His subsequent undertakings against the Turks were not equally successful. He died of apoplexy on 17th June 1696. John Sobieski was not only a statesman and warrior, but a lover of science, and a man of gentle disposition and agreeable manners; but his constant wars prevented that attention to the internal condition of Poland which its critical situation urgently required, and this oversight on his part helped to hasten the downfall of Poland.

JOHN OF AUSTRIA, or DON JUAN D'AUSTRIA, was a natural son of the Emperor Charles V., and was born at Regensburg, on 24th February 1546. It is uncertain who his mother was. He was early brought to Spain; and after the death of his father, he was acknowledged by his halfbrother, Philip II.; houseurs and an annual allow-ance were hestowed upon him, and he was educated along with the Prince of Parma and the Infant Don Carlos. He was intended for the church; but his own inclination was for military employment, and in 1570 he received the command of an army sent against the rebellious Moors in Granada, whom he completely rooted out of the country-signalising himself at once by valour and by crucity. Iu 1571, he was appointed to the command of a maritime expedition-in which the forces of Spain, the pope, and Venice were united against the Turks-and defeated the Turks in a great battle near Lepanto (October 7). Discord breaking out among the allies, Don Juan separated himself from the rest, took Tunis, and conceived the design of forming a kingdom for himself in the north of Africa. But Philip, jealous of this design, sent him to Milau, to observe the Genoese; and afterwards, in 1576, to observe the Genoese; and atterwards, in 100, as vicercy to the Netherlands. In this capacity, he sought to win the favour of the people by mildness; but being left unsupported by Phillip, he was hard pressed for a time, till the arrival of the Prince of Parma with troops enabled him to restore the fortunes of Spain by the victory of Gemblours over William the Silent, in 1377. But Philip was now apprehensive that Don Juan might make himself king of the Netherlands; and the untimely death of the latter in his intrenched camp at Namur, on 1st October 1578, was not without suspicion of poison. See Dusmenil's Histoire de Juan d'Autriche (2d ed., Paris, 1828).

JOHN O' GROAT'S HOUSE (or, more correctly, it would seem, JOHNNY GROAT'S HOUSE), on Dungausby Head, the north-eastern extremity of the mainland of Scotland, has been long widely known as marking one of the limits of that country, as in Burns's line:

Frae Maidenkirk to Johnny Groat's.

King James IV. (1488-1513), three brothers -Malcolni, Gavin, and John Groot or Grot supposed to be Hollanders, settling in Caithness, acquired the lands of Warse and Dungansby. When their descendants had so multiplied that they were eight families, disputes arose as to precedency at a yearly festival which they were wont to keep, John Groat settled the controversy by building an eight-sided house, with a door and a window in each side, and an eight-sided table within, so that the head of each of the eight families of Groats might enter by his own door, and sit at his own head of the table. Whatever credit may be due to this legend, there can be no doubt as to the existence of John Grot. In the year 1496, 'John Grot, son of Hugh Grot,' had a grant of a penny-land in Dungansby from William, Earl of Caithness. In Dingansity from William, Earl of Cattiness. In 1325, 'John Grot in Dongasby,' as a is name is written, chamberlain and balle of John, Earl of Cattiness, gave seisin to thell refinity Friars of Aberdeen, of a yearly payment from the island of Strong, in the Fentland Firth. He died soon afterwards, and was succeeded by his son William, or his grandson John. In 1540, there was a payment from the Scottish treasury of £20 'to John Grote. for freight of his ship sent by the queen's grace, from St Andrews to Orkney, to the king's grace with writings.' In 1547, John Grot had a pardon from Queen Mary for helping the Earl of Caithness to storm the Earl Marischal's castle of Akirgill. About 1741. Malcolm Groat sold his lands in Dungausby. with the ferry-house, to William Sinclair of Fres-The family of Groat still exists; but a when the lamily of Groat still exists; but a small green knoll is all that now remains of John o' Groat's House. The shell Cypræa Europæa, which abounds in the neighbourhood, has received the name of 'John o' Great's bucky.

JOHN (St) OF JERUSALEM, KNIGHTS OF, otherwise called KNIGHTS OF RHODES, and afterwards of MALTA, the most celebrated of all the military and religious orders of the middle ages. It originated in 1048 in an hospital dedicated to St John the Baptist, which some merchants of Amalfi were permitted by the calif of Egypt to build for the reception of the pilgrims from Europe who visited the Holy Sepulchre. The nurses were at first known as the Hospitaller Brothers of St John the Baptist of Jerusalem. The Seljuk Turks, who succeeded the Egyptian and Arabian Saraceus in Palestine, plundered the hospice, and on the conquest of Jerusalem by the crusaders under Geoffroy de Bouillon in 1099, the first superior, Gérard, was found in prison. Released from durance, he resumed his duties in the hospice, gave material aid to the sick and wounded, and was joined by several of the crusaders, who devoted themselves to the service of the poor pilgrims. By advice of Gérard, the brethren took vows of poverty, chastity, and obedience before the Patriarch of Jerusalem. Pope Pascal H. gave his sanction to the institution in 1113. Raymond du l'uy, the successor of Gérard in the office of superior, drew up a body of statutes for the order, which was confirmed by Pope Calixtus II. former obligations was afterwards added those of fighting against the intidels and defending the Holy Various hospices, called commanderies, were established in different maritime towns of Europe as resting-places for pilgrims, who were there provided with the means of setting out for Palestine. The order having become military as well as religious, was recruited by persons of high rank and influence, and wealth flowed in on it from all quarters. On the conquest of Jerusalem by Saladin in 1187, the Hospitallers retired to Margat in Phoenicia, whence the progress of infidel arms drove them first, in 1285, to Acre, and afterwards, in

1291, to Limisso, where Henry II., king of Cyprus, assigned them a residence. By the statutes of Raymond, the brethren consisted of three classes, Knights, Chaphains, and Serving Brothers; these last being fighting squires, who followed the knights in their expeditions. The order was subsequently divided into eight languages—Provence, Auvengue, France, Italy, Aragon, Eggland, Germany, and Castile. Each nation possessed several Grand Priories, under which were a number of commanderies. The chief establishment in England was the Priory at Clerkenvell, whose head had a seat in the Upper House of Parliament, and was styled First Barno of England.

In 1310, the knights, under their grand-master, Foulkes de Villaret, in conjunction with a party of crusaders from Italy, captured Rhodes and seven adjacent islands from the Greek and Saracen pirates, by whom it was then occupied, and carried on from thence a successful war against the Saraccus. In 1523, they were compelled to surrender Rhodes to Sultan Solyman, and retired first to Candia and afterwards to Viterbo, In 1530, Charles V. assigned them the island of Malta, with Tripoli and Gozo. ful bulwark against the Turks; but after the Reformation a moral degeneracy overspread the order, and it rapidly declined in political importance; and in 1798, through the treachery of some French knights and the cowardice of the grand-master, D'Hompesch, Malta was surrendered to the French. The lands still remaining to the order were also about this time confiscated in almost all the European states; but though extinct as a sovereign body, the order has continued during the present century to drag on a lingering existence in some parts of Italy, as well as in Russia and Spain. Since 1801, the office of grand-master has not been filled up: a deputy grand-master has instead been appointed, who has his residence in Spain. The order at first wore a long black habit, with a pointed hood, adorned with a cross of white silk of the form called Maltese on the left breast, as also a golden cross in the middle of the breast. In their military capacity, they were red surcoats with the silver cross before and behind. The badge worn by all the Knights is a Maltese cross, enamelled white, and edged with gold; it is suspended by a black ribbon, and the embellish-ments attached to it differ in the different countries where the order still exists.

JOHN OF LEXUEN (properly, Johns Bocketts soor of Bocketts) was been at Leyden in 1510. He was the son of a bailiff in the Hague, and of a Westphalian bondwoman. He wandered about for some time as a journeyman tailor, and then settled in Leyden, but was fonder of amusements than of his trade. He possessed some poetic genius, and was noted for his abilities as an actor. Adopting the equinous of the Anakaptists (a, v.), in because to Minster, was the chief supporter of Matthiesen or Matthys there, and when Matthiesen lost his fie in 1534, became his successor. He set aside the ancient constitution of the city, set no in Minster the kingdom of Zona, 'appointed judges, and applied in an extravagant manner the principles of the Old Testament theorems. He himself became king of Zion. It is impossible to account for his conduct, and the extraordinary influence real faunticism; but sensuality, vanity, and blood-thristiness were intimately combined with it. He introduced polygamy, and displayed a great love (kingly pomps. The city was taken by the interest of heroid excesses. In June 1555, it was taken by this bishop of Muster. John and his chief accomplies

suffered death with circumstances of fearful cruelty (January 26, 1536), and his body was suspended in a cage from a high tower. He attempted to save his life by confession and submission.

JOHN OF NEPOMUK (more properly, Pomur.), a popular Bohemian saint of the Catholic Church, and honoured as a martyr of the inviolability of the seal of confession. He was born at Pomuk, a village in the district of Klatau, about the middle of the 14th century. Having entered into orders, he rose rapidly to distinction, being created a canon of the capitally to distinction, being created a canol of the cathedral of Prague, and eventually vicar-general of the diocese. The queen. Sophia, the second wife of Wenzel or Wenceslans IV., having selected him for her confessor, Wenceslans, himself a man of, most dissolute life, conceiving suspicions of her virtue, required of John to reveal to him what he knew of her life from the confessions which she had made John steadfastly refused, and the king resolved to be revenged for the refusal. An opportunity occurred soon afterwards, when the monks. of the Benedictine abbey of Kladran having elected an abbot, in opposition to the design of the king, who wished to bestow it upon one of his own dissolute favourites, John, as vicar-general, at once confirmed the election. Wenceslaus, having first put him to the torture, at which he himself personally presided, had him tied hand and foot, and flung, already half dead from the rack, into the Moldau, in March 1393. His body, according to the tradition, being discovered by a miraculous light which issued from it, was taken up, and buried with the greatest honour. His memory was cherished with peculiar affection in his native country, and be was eventually canonised as a saint of the Roman Catholic Church, his feast being fixed for the 20th of March. By some historians, two distinct personages of the same name are enumerated: one, the martyr of the confessional seal; the other, of his resistance to the simoniacal tyranny of Wenceslaus; but the identity of the two is well sustained by Palacky, Geschichte von Böhmen, iii. 62.

JOHN THE BAPTIST, the forerunner of Christ, was the son of the priest Zacharias and Elizabeth, the cousin of Mary, the mother of our Lord. John and Christ were therefore secondcousins. The wonderful circumstances attending the conception and birth of the former, are recorded in the 1st chapter of St Luke's gospel. After a life devoted to preparing his countrymen for the coming of the Messiah, he was thrown into prison, and afterwards executed by Herod Antipas. J.'s followers existed as a separate body till long after followers existed as a separate body can long acter the spread of Christianity, and a sect still exists in the East professing to be his disciples.—J. the E. was, from an early date, regarded in England as the patron saint of the common people, and on this account, apparently, great masonic festivals are held on St John's Day, the day dedicated to him, which is the 24th of June.

JOHN THE PARRICIDE, commonly called JOHN OF SWABIA, son of Rudolf II., and grandson of Rudolf I. of Austria, was born in 1289. On attaining his majority, he applied to his uncle, Albert I. of Austria, to resign to him the whole or a part of his patrimony, which consisted of Kyburg and some estates in Swabia; but this Albert refused and some cases in Swadan; our ansalorer released to do. After making many other aboritive attempts to gain his end, J. formed a conspiracy with others who had cause to complain of Albert's rapacity, and determined to assassinate the emperor; seizing the opportunity when Albert was riding alone, on the bank of the Reuss, near the castle of Hapsburg,

betaking himself to Italy, where he led a wandering life, and died in obscurity.

JOHN'S, Eve of St, one of the most joyous festivals of Christendom during the middle ages, was celebrated on midsummer eve. From the account given of it by Jakob Grimm in his Deutsche Mythologie (Bd. i. pp. 583-593), it would appear to have been observed with similar rites in every country of Europe. Fires were kindled chiefly in the streets and market-places of the towns, as at Paris, Metz, &c.; sometimes, as at Gernsheim, in the district of Mainz, they were blessed by the parish-priest, and prayer and praise offered until they had burned out; but, as a rule, they were secular in their character, and conducted by the laity themselves. The young people leaped over the flames, or threw flowers and garlands into them, with merry shoutings; songs and dances were also a frequent snoutings; songs and dances were also a frequent accompaniment. At a comparatively late period, the very highest personages took part in these festivities. In England, we are told (see R. Chambers's Book of Days, June 24), the people on the Eve of St John's 'were accustomed to go into the woods and break down branches of trees, which they brought to their homes, and planted over their doors, amidst great demonstrations of joy, to make good the prophecy respecting the Baptist, that many should rejoice in his birth. This custom was universal in England till the recent change in manners. Some of the superstitious notions connected with St John's Eve are of a highly fanciful nature. The Irish believe that the souls of all people on this night leave their bodies, and wander to the place, by land or sea, where death shall finally separate them from the tenement of clay. It is not improbable that this notion was originally universal, and was the cause of the widespread custom of watching or sitting up awake on St John's night, for we may well helieve that there would be a general wish to prevent the sonl from going upon that somewhat dismal ramble. In England, and perhaps in other countries also, it was believed that, if any one sat up fasting all night in the church porch, he would see the spirits of those who were to die in the parish during the ensuing twelve months come and knock at the ensuing twelve mounts come and knock at the church door, in the order and succession in which they were to die. We can easily perceive a possible connection between this dreary fancy and that of the soul's midnight ramble. The kindling of the fire, the leaping over or through the flames, and the inc, to eaging over or through the names, and the flower-garlands, clearly show that these rites are essentially of heathen origin, and of a sacrificial character. They are obviously connected with the worship of the sun, and were doubtless practised long before the Baptist was born. In old heathen times, Midsummer and Yule (q. v.), the summer and winter solutions were the two creeks, and and winter solstices were the two greatest and most widespread festivals in Europe. The church could not abolish these; it could only change their name, and try to find something in the history of Christianity that would justify the alteration.

JOHN'S, Sr, a city of the West Indies, capital of the island of Antigua (q. v.), and the residence of the governor-in-chief of the Leeward Islands, is situated at the western side of that island, close to situated at the western side of that island, close to the shore. Pop. 8515. The town is well laid out, having spacious streets, of which the principal run east and west, being so arranged in order to obtain full advantage of the refreshing easterly or trade winds, which prevail here from April to August. The harbour is comparatively shallow, and there is the same of the reverse, mar the case of majoring, is not across the mouth of it, so that vessels heavily they attacked and murdered him, 1st May 1308. Indeed are obliged to drop anchor outside. The compirators field in different directions, J. cathedral, the court-house, and the new marketa bar across the mouth of it, so that vessels heavily house are the chief edifices. Water is scarce here, and in long dry seasons the inhabitants suffer greatly from the want of it. Wells have been sund in the town, but the water obtained is brankish, so that rain-water collected in iron and other cistems that rain-water collected in iron and other cistems from the only supply of this invaluable element. The maximum heat is 96°; the minimum, 62°. The average fall of rain is said to be 45 inches.

JOHN'S, Sr, the chief town of Newfoundland, stands on the east coast of the island, in Int. 47, 33 Ns, and long 52° 43° W. It has an excellent labour, which is well fortified. Pop. 25,000. Being the nearest port in America to Europe (distance 1655 miles), and counceted with continental America by telegraph, 84 John's has recently acquired importance in the commercial and political world in connection with steam mavigation between the two continents. It has suffered severely from repeated conflagrations; in 1846, it was more than half destroved.

JOHNS, Sr, a thriving town of Canada East, is situated on the left hank of the river Richelieu, opposite the town of St Athanase, with which it is connected by a bridge, and 21 miles south-east from Montreal. It contains glass-works, potteries, from Montreal. It contains glass-works, potteries, foundries saw-mills, &c., and carries on a considerable trade in lumber, firewood, horses, and grain. Pop. abant 5000.

JOHN'S COLLEGE, or the College of St John the Baptist, Oxford, succeeded an older institution, founded by Archbishop Chichele in 1456, for monks of the Cistercian order. Sir Thomas White procured a licence from King Philip and White produced a hoeace from king lamp and Queen Mary, and in 1555 founded a college, dedicated 'to the honour of God, the Virgin Mary, and St John the Baptist,' on the site of Archbishop Chichele's College. The foundation consists of a president, 50 fellows and scholars, and a choir. Six of the fellowships are founders' kin; two from Coventry, two from Bristol, two from Reading, and one from Tunbridge Schools; all the rest are from Merchant Taylor's School. In 1854, four fellowships were added by the will of 1834. four tellowships were added by the wut of Dudley Faraday, Esquire. These are open, with a preference, however, first, to founder's kin, and second, to natives of Staffordshire. This college presents to 30 benefices. In 1860, there were about 350 names on the books. The arrangements of this college were not altered by the commissioners under 17 and 18 Vict. 81. The commissioners of 1852, indeed, proposed extensive changes, which the commissioners under the act were disposed to carry out, but the college succeeded in baffling their endeavours. Similar changes, however, to those recommended by the Commissioners-involving, among other points, the throwing open of half the the authority of the Privy Council

JOIN'S COLLEGE, Sr. Cambridge, was formed in 1511 by Lady Margaret, contess of Rr bm-sad, and mother of Henry VII.; but her dark happening before the design was completed, lar executors, one of whom was Fisher, Bishep of Rochester, carried her intentions into effect. The site of the college had been long before devoted to pious uses, but three times was the disposition of the property altered—1st, when Neal, Bishop of Ely, founded here a hospital for Canons Regular in 1134; 24ly, when Hugh de Balsham made it into a prorty, delicated to 84 John the Yangelsit; 34ly, when Lady Margaret's executors converted it into a college The Sectory, tifty-six fellows, sixty scholars, and nine proper sizars. There are also numerous exhibitions of considuable value, and

eight misor scholarshijs open every year to competition for students who have not yet commenced residence in the university. Amongst names of interest may be mentioned William Grindal, tutor to Queen Elizabeth, Boger Ascham; Cecil, Lord Burkiegh, Richard Renliey (who became master of Burkiegh, Richard Renliey (who became master of tyn, &c. For full particulars, see Cooper's Memorials of Combridge.

JOHNSON, SAMUEL, son of Michael Johnson, was born at Lichtfield, on the 18th September 1709. He received his early education in his native town.

from a man named Hunter; of whom he has recorded that 'he beat me very well'—adding, 'without that I should have done nothing.' In 1728, he went to Pembroke College, Oxford, having been engaged for the two previous years of his hie in learning his father's business of bookseller. The Short Account of Lichfield, 1819, says that books of his binding are still extant in that city. At Oxford, J. spent probably the most unhappy period of his unhappy life. Overpowered by debts, difficulties, and reliine. Overpowered by debts, difficulties, and reli-gious doubts, he became a prey to the morbid melancholy of his constitution. Poverty prevented him from taking his degree. In 1731, his father ded insolvent. In the same year he went to Besoworth as usher of a school. Finding the drudgery of this situation unbearable, he soon gave it up, gaining a meagre livelihood by working for booksellers in Birmingham. In 1736, he married Mrs Porter, a widow : she brought him £800. He then set agoing a school, which having no success, he repaired (1737) to London in the company of his celebrated pupil, David Garrick. Here he formed a connection with Cave, the editor of the Gentleman's Mayazine, to which periodical he became a contributor. In the following year he published London, a poem in imitation of the Third Satire of Juvenal, which was very favourably received, Pope, in parti-cular, being warm in its praise. But for many years he was miserably remunerated for his work, and had great difficulty in keeping the wolf of hunger from his door. Little is known respecting J.'s life from this period till he was turned of tifty. We may form, however, some guess of the measure of its unhappiness, when we consider the character and constitution of the man, and what was the position of the majority of men of letters at that time for literature, 'a dark night between two sunny days'—when the day of patrician patronage was at its close, and that of public patronage had not yet dawned. After 1740, he began to 'report' (if we may be allowed to misuse this word) the parliamentary debates for Cave's Magazine. These debates' were drawn up by J. himself, after he had ascertained the order in which the different speakers rose, and the drift of their arguments. One can readily believe that statesmen were surprised at reamy believe that searching were surprised with splendour and pomp of their own cloquence when they saw it in prut. In 1744, J. published his interesting Life of Richard Savage; in 1749, his best poem, The Vanity of Haman Wishes, an imitation of the Tenth Satire of Juvonal; and in 1750 commenced The Rambler, a periodical which he conducted for two years, and the contents of which were almost wholly his own composition, His Dictionary, a noble piece of work, entitling its anthor to being considered the founder of English author to heigh considered the loancer of Engine lexicography, appeared in 1755, after eight years of solid inbour; The Iller, another periodical, was begun by J. in 1758, and carried on for two years also; and in 1759 occurred one of the most touching episodes of his life the writing of Rasselas to pay the expenses of his mother's functal. It was written, he tells us, 'in the evenings of a week.' At last he emerged from obscurity. In 1762, a

pension of £300 a year was conferred on him by Lord Bute : and in the following year occurred an event, apparently of little moment, but which has had a lasting influence upon his fame : this was his introduction to James Boswell, whose Life of Dr Johnson is probably more imperishable than any of the doctor's own writings. In 1764, the famous Literary Club was instituted, and the following year began his intimacy with the Thrales. In the same year appeared his edition of Shakspeare. In 1773, he visited the Highlands with Boswell. In 1781, appeared his Lives of the Poets, his last literature. work of any importance. He died on 13th December 1784. He was buried in Westminster Abbey, close by the grave of Garrick.

Strength, or at least force of mind, a certain sage solemnity in the treatment of moral themes, a sharp eye for the observation of character as it manifests itself in society, and a great power of caustic wit, are the chief qualities noticeable in Johnson. had little aptitude for abstract thinking, and no great vigour of imagination-hence he was neither a philosopher nor a poet; but he had good sense, a solid judgment, and a serious thoughtful nature hence we find scattered through his numerous works a multitude of valuable remarks on books and men and manners. His written style is very sonorous, inflated, and antithetic; the language is frequently grander than the thought, but his conversational style, as reported by Boswell, is terse, robust, and

felicitous in the highest degree.

JOHNSTON, ALEXANDER KEITH, the most distinguished name in British cartography, was born near Edinburgh, December 28, 1804. The elegance of design that characterises all his productions, and which, in spite of their purely utilitarian aim, gives them a right to rank as specimens of fine art, was probably acquired or developed during his apprenticeship as an engraver. His first important work, the National Atlas (fol.), was published in 1843. Its merits received immediate recognition, and J. was appointed Royal Geographer for Scotland. Five years later, appeared his far-famed Physical Atlas of Natural Phenomena, the publication of which was the signal for a shower of honours from the geographical societies of Europethat of Paris, in particular, pronouncing the work one of the most magnificent monuments that has yet been raised to the scientific genius of our age. second edition, greatly improved, was issued in A second enton, greatly improved, was issued in 1856. In 1850, appeared a very useful Dictionary of Geography, better known as 'Johnston's Gazetteet' (3d ed. 1859; 4th ed. of more recent date). His last and greatest work, the Royal Atlas of Geography (Edin. Blackwood and Sons, 1861), is probably the most beautiful and minutely accurate atlas ever executed. J. has also published, in conjunction with other savants, Hind, Murchison, and Nicol, atlases of Astronomy and Geology; besides a great number of very valuable educational atlases, physical, general, and classical, which have obtained a wide circulation.

JO'HNSTONE, a manufacturing town of Scotland, in the county of Renfrew, was founded in 1781, and is situated on the Black Cart, about three miles west-south-west of Paisley. It contains several cotton factories, brass and iron foundries and machine-shops. Pop. (1861) 6404, one-third of whom are employed in the cotton manufacture.

JOHNSTONE, JAMES T. W., an eminent chemist, was born at Paisley in 1796, and died at Durham in 1853. He was of bumble parentage, and was for the most part self-educated. In 1825,

a lady of considerable fortune, he resolved to carry out the plan which he had long desired, of devoting himself to the study of chemistry. He accordingly repaired to Stockholm, and became the pupil of Berzelius, the most celebrated chemist of the time; and his reputation rose so rapidly, that in 1833, while still pursuing his studies abroad, he was invited to take the readership in chemistry and mineralogy in the newly-established university of Durham, some time after his return from the continent, he resided in Edinburgh, and held the post of chemist to the Agricultural Society; but shortly after its dissolution, he took up his permanent residence at Durham. It is as an agricultural chemist that he is chiefly known. His Catechism of Agricultural Chemistry and Geology has gone through more than fifty editions, and has been translated into almost every European language; and his Lectures on Agricultural Chemistry and Geology are held in high esteem. The last of his works was his Chemistry of Common Life, which originally appeared in Black-wood's Magazine, and has since gone through two editions. In the summer of 1853, while travelling on the continent, apparently in his usual health, he was seized with spitting of blood, which terminated in a rapid decline.

JOIGNY (anc. Joviniacum), an old walled town of France, in the department of Yonne, about 90 miles south-east of Paris, noted for its red wines and extensive trade in wool. Pop. about 6500.

JOINERY, the art of joining or framing together the wooden finishings of buildings, such as the doors, windows, shutters, stairs, &c. See Carpentry.

JOINT AND SEVERAL, a legal phrase in England and Ireland, meaning that a contract or obligation is made by, or in favour of, each of several parties, independently as well as jointly with the others. The general rule of law is, that a contract of several persons is joint, and not several—that is to say, if it is sought to be enforced against them, they must all be sued together, and an action cannot be brought against one. Thus, for an action cannot be brought against one. Thus, or example, if A, B, and U jointly accept a bill, or make a promissory-note, without saying, 'we jointly and severally promise, &c.,' the whole of them must be sued on such bill. If, however, any one pay the whole debt, he can sue his co-contractors for their respective contribution or proportion-namely, onethird from each. It, on the other hand, the parties had, by express words, jointly and severally made the promissory-note, or bound themselves, then the creditor could sue any one of them he pleases, with-out taking any notice of the rest. Whichever of them, however, first paid the debt, would be equally entitled to sue his co-debtors to contribute their fair proportions. So, if a contract is made in favour of two or more persons, the general rule is, that all of them must join in any action brought to enforce the contract. But in some cases, when a contract the contract. But in some cases, when a contract is capable of being separated into distinct interests it is not necessary that all of the creditors should sue. Much depends on the nature of the contract, the situation and relations of the parties, and who paid the price or consideration. In Scotland, the phrase conjunctly and severally is more frequently used than jointly and severally, though the mean-ing is the same. There are, however, some differences between the laws of England and Scotland on the subject. In Scotland, the general rule is the reverse of what it is in England. When a contract is joint, each is concerned and liable only for his share; but when it is expressly stated to be a conjunct contract, each is liable for the whole. he removed to Durham, where he opened a school, Moreover, where one of several debtors is discharged which he continued till 1830, when, having married without an express reservation of the remody against

the rest, this operates in England as a discharge to the whole; whereas in Scotland it operates only as a discharge of that one.

JOINT-FIR. See SEA-GRAPE.

JOINT OWNER is, in English Law, a person who is one of several owners of property. property may be either personal or real, goods or and. One of the characteristics of this ownership is, that if one of the parties dies, his interest accrues to the others, and does not go to the deceased co-owner's heirs or representatives. Thus, if A and B are joint owners of a horse, and A dies, the horse then belongs entirely to B. So it is with real property, such as houses, lands, and estates. This is called the doctrine of survivorship. Sometimes in wills and deeds it is not clearly expressed whether the property was given to A and B as joint tenants or owners, or as tenants in common. The chief difference between these two descriptions of owners is, that if one tenant in common dies, his share does not go to the other tenants in common, but belongs to his representatives or heirs. Hence, in doubtful cases, a court of county generally inclines to hold that a tenancy in common was meant rather than a joint tenancy, for the former is the more fair of the two kieds of ownership. In all cases, however, it is in the power of a joint owner to convert his joint tenancy into a tenancy in common, by simply executing a deed of partition or alienation, if the property consist of land; or selling his share, if it consist of personalty. And there is an exception as to the survivorship in the case of a firm of partners, for in that ease, when one partner dies, his share does not accrue to his co-partners, but belongs to his own personal repre-sentatives. This is said to be an exception to the general rule of joint ownership, created for the benefit of trade, so that, in the case of a firm, the ownership is an ownership in common, and not joint ownership. In Scotland, the general rule is different from what prevails in England, and joint property is there always equivalent to what is called in England property held in common, and not joint in the above seose. It requires express words in Scotland to make the property be held so as to be equivalent to what is joint property in England.

JOINT-STOCK COMPANY, an association of individuals who unite to carry out a particular object of a private nature by each taking and paying for shares in the common stock. The object of the association may be to manufacture some species of article, to conduct some branch of trade or commerce, the business of banking or insurance, or in general to do whatever work of a private nature execute a public undertaking, such as a railway, a canal, harbour, or other work of importance, the company is not called a joint-stock company, but a public company, and a special act of parliament is required in order to establish it and regulate its proceedings. In many respects, the proceedings of railway, canal, and public companies resemble those of what are called joint-stock companies. In ordinary circumstances, the capital or stock of a joint-stock it is mainly on this account that the joining of parties together to undertake risks is expedient and unavoidable; though there may be instances, as in the case of Co-operation (q. v.), where a union of small sums by a large number of persons is for peculiar reasons recommendable. Joint-stock companies are of comparatively modern origin, and they can exist with a chance of success only in a community

with a spirit of enterprise, and where there is that degree of mutual confidence which will give stability to the concern. Accordingly, from a concurrence of favourable circumstances, Great Britain has taken the lead in this kind of undertakings, which, however, have also been carried to maturity on a comprehensive plan in the Netherlands and United States. Joint-stock associations are not common in the United States, incorporation being a better method of union and more readily obtained.

The usual process of commencing a joint-stock company is to issue a prospectus, detailing the object of the undertaking, inviting the subscription of shares, and specifying the probable profits. As the proposed company necessarily requires a paid secretary, who is in effect to be its constructer and future attaché, it too frequently happens that in periods of ease in the money market, scheming solicitors and others devise projects of this kind, and induce inexperienced capitalists to take shares; the result often being a collapse of the company, to the loss of all concerned, the projector alone excepted. On this account, serupulous care is necessary in making such investments, to see that the proposed companies are of genuine worth, and to be administered by persons of thorough integrity.

Every joint-stock company sets out on certain rules of management, which receive the approval of the shareholders, who name a chairman and board of directors, and these, on being appointed, choose subordinate officials. Whatever be the rules, and also the implied responsibilities, the practice is to allow considerable latitude to the chairman and other directors in conducting the affairs of the company, for they alone are in a position to form a correct judgment on points deeply concerning the character and welfare of the association. As, with the best intentions, they may fall into error, and thereby incur heavy losses of capital, it is reasonable to hold them blamcless, unless chargeable with fraud in their representations and general dealings. Ordinarily, and with reckless imprudence, shareholders ask no questions, and experience no suspicions as long as they are getting satisfactory dividends-an indifference to consequences which sometimes suffers a severe retribution.

Joint-stock companies are at best a clumsy and often not very satisfactory method for accomplishing a particular purpose. Conducted by directors or managers with whatever dexterity, they fall immeasurably behind as regards the energy, breadth of calculation, vigilance, and promptitude with which a business may be conducted by a single individual, or by two or three active partners, ready on the instant to take advantage of every important turn in the market. Unless, therefore, in the exceptional circumstances referred to, and also in gigantic concerns which no single individual or ordinary copartnery would undertake, joint-stock companies are economically inexpedient.

The legislature has on different occasions interposed to regulate the principles of joint-stock companies, and protect the public against the injuries which they may recklessly inflict. The safest undertakings are those of a public nature, and which are therefore incorporated by special act of parliament, for besides that their rules have been scrutinised by committees of the Commons and Lords in terms of certain standing orders, the liability of shareholders is limited expressly to the amount of their respective stocks. Railway compapies are of this category. Where there is no such limitation by statute, any single shareholder incurs a responsibility equal to the whole debts of the concern, and he can seek relief only against his possessing good business notions and habits, along brother shareholders conjointly or severally. The

appalling nature of this responsibility, and the necessity for as far as possible averting it, have induced the legislature to empower the organisation of companies on a method of limited responsibility; in this respect copying a plan which had worked successfully in the United States. To participate in the benefit of this limitation, companies need to be publicly registered according to certain statutory obligations, by which means all have an opportunity of judging of their character. We add a brief analysis of the laws affecting joint-stock companies without and with hmited liability.

Numerous statutes have been passed during the last 30 years in England, Scotland, and Ireland, to regulate the constitution and proceedings of jointstock companies, and there were separate statutes for each kingdom, and also for different kinds of companies in each kingdom. The principle of limited liability was first introduced in 1856. All these separate statutes, which led to much confusion, have been now repealed, and replaced by one consolidated statute, called the Companies' Act, 1862, 25 and 26 Vict. c. 89, which, taken along with the common law, constitutes the code of joint-stock companies now applicable to the United Kingdom. This general act contains provisions for enabling existing companies previously registered to register themselves under the new act. The same formalities are made applicable, with slight variations, to all jointstock companies, whether limited or unlimited. The grand distinction between limited and unlimited companies is, that whereas formerly, if a company contracted debts, no matter how large, every memcontracted dents, no matter now large, every member was liable, if his co-members proved to be unable to pay their proportions, to pay the whole of these debts, even to the last shilling of his fortune—a result which proved ruinous to the richer members: now, on the other hand, if the company is limited, though it contract debts however large, yet each member can in no event be called on to pay more than he expressly guaranteed; thus he knows at the outset the worst that can befall him. Hence it follows that if a limited company contract excessive debts beyond what the members are bound to pay, it is the creditors alone who will chiefly suffer; but they have such ample means of satisfying themselves beforehand about the position and capabilities serves beforehand about the position and capabilities of the company, by reason of the publicity and access to books now provided, that they can only blame themselves if they credulously give too large

It may be also noticed, before stating the details more particularly, that no partnership of bankers which consists of more than ten persons shall be formed in future unless it is registered and conducts its business under the Companies' Act, 1862; and other partnerships consisting of more than 20 persons, are in like manner compelled to register as a company, unless they are already registered, or are formed by some act of parliament or letters-patent. The subject will be most conveniently noticed

under certain heads. 1. Constitution and Incorporation of Companies and Associations.-Any seven or more persons associated for any lawful purpose may subscribe a memorandum of association, and may define their hability as follows. They may limit their liability either to the amount, if any, unpaid on their shares, or to such amount a sthey may respectively undertake to con-tribute to the assets of the company, in the event of its being wound up. If the liability is limited by shares, then the word 'limited' must be added to the name of the company; and the amount of capital, object, place of business, and declaration of the limit, must be defined in the memorandum of association, never be liable to pay more than the maximum II the liability is limited by guarantee, the word | share or guarantee, whatever be the amount of the 734

'limited' must also be added, and the amount of guarantee defined, so as to extend to all liabilities guarantee democrates as to extend to all mainless incurred while the party is a member, and within one year after. If the company is formed on the principle of no limit being placed on the liability of its members, the declaration of any limit is omitted, and it is called an unlimited company. The memorandum of association is to be stamped and signed by each subscriber in presence of one witness, and when registered, it binds the company and members. A company in general cannot after this memorandum of association, unless where it is a company limited by shares, and wishes to increase its capital or shares. Nor can a company alter even its name, unless by special resolution of the company, approved by a secretary of the Board of Trade. Besides the memorandum of association, there must be articles of association, also signed by the subscribers, stating the rules of the company; or if the company is limited by shares, and has no such articles, theu the rules stated in schedule A to the act occupy their place. The articles of association must be printed.

The memorandum and articles must be delivered to the registrar of joint-stock companies, who shall register the same, and grant a certificate of incorporation. Each member is entitled, on request, and payment of 1s., to have forwarded to him a copy the memorandum and articles of association, otherwise, the company forfeits a penalty of £1 in each case. Companies are prohibited from adopting the same name as another company, and in some cases they cannot, without leave of the Board of Trade, hold more than two agres of land.

2. Distribution of Capital and Liability of Members. -The interest or share of each member is part of his personal, and not real estate. A member is entitled to have his name entered on the register of entitled to have his hame entered of the register of members, which contains the name and address of each, his date of entry, his shares, &c. An annual list is to be made out of all members, with the names, addresses, and occupations of each, as well as the amount of capital, shares, calls, &c., possessed and paid by each, and this list is to be sent to the registrar of joint-stock companies for inspection. Every member is entitled to inspect at the office of the company the register of members gratis, and any other person is also entitled to do so on payment of ls., or such member or person may demand a copy on payment of 6d. for every 100 words. If the name of a person is without cause entered or omitted in the register, he can set the matter right by appli-cation to the court. When a company is wound up, every member past and present must contribute towards the assets enough to pay the debts of the company, subject to the following qualifications:

1. No past member shall be liable who has ceased for one year to be member; 2. No past member is hable one year to be member; 2. No past member is nable to contribute to any debt contracted after he ceased to be member; 3. No past member shall be liable to contribute, unless the existing members are unable to pay the debts; 4. In case of a limited company, no member is bound to pay more than the amount unpaid on shares, or the amount guaranteed by him

to be paid, according to the memorandum of assoto be pair, according to the memorandum of asso-ciation. In insurance companies, if the policy or contract makes the funds alone liable, such contract will remain good. If, at the winding up, any divi-dend is due to a member, this is to be deemed part payment of his contribution. The result, therefore, is, that in all unlimited companies, while one rich member may be liable to his last shilling to pay the whole debts of the company, in the event of his co-members not being able to bear their shares of these debts; in limited companies, each member can

pay their shares or not,

3. Management and Administration of Companies. -Each company must have an office where its business is carried on, and give notice thereof to the registrar. If the company is limited, it must have its name painted up in a conspicuous place outside its office, and its name must, under a penalty, be printed or engraved on all its notices, advertisements, bills of exchange, cheques, receipts, &c. Every limited company must also keep a register of mortgages affecting its property, which any member or creditor is entitled to inspect at all reason-able times. Some companies—viz., limited banking, insurance, deposit, provident or benefit societiesmust also each year make out and suspend in their offices a statement of their debts and assets. Every company not having a capital divided into shares, must keep at its office a register of its directors and managers. No company is to carry on business when the number of members is less than seven, otherwise each such member, if cognizant of the fact, shall be liable for the whole debts of the company, A general meeting of the company must be held once nt least every year. The company may in general meeting alter its regulations by special resolution, passed by not less than three-fourths of the members, and a copy thereof must be sent to the registrar, and given to each member. The Board of Trade may appoint one or more inspectors to examine and report on the affairs of the company on the following application: I, in case of a banking company having a capital divided into shares, on the application of members holding one-third or more of the shares; 2, in the case of any other company with shares, on the application of members holding one-fifth or more of the shares; 3, in the case of any company not having a capital divided into shares, on the application of one-tifth or more of the members. reasons of the application must, however, be sup-ported by satisfactory evidence. The expenses of such examination shall fall on the members requiring it, unless the Board of Trude order them to be paid out of the company's funds. The company itself may also by special resolution appoint inspectors to report on the company's affairs.

4. Winding up of Companies. - A company may be wound up whenever it passes a special resolution to that effect; also, whenever it does not commence business within a year after incorporation, or sus-pends its business for a whole year; also, whenever its members are reduced to less than seven; also, whenever it is unable to pay its debts; and lastly, whenever the court thinks it is just and equitable that it should be wound up. A company is in the above sense deemed to be unable to pay its debts whenever a creditor to whom the company owes a debt above £50 has formally demanded in writing payment of such debt, and the company for three weeks have neglected to pay, or secure, or compound for it. Other tests of being unable to pay its debts are, when the company allows execution to issue for a debt, &c. Application may be made to wind up the company by petition presented by any creditor or contributory of the company. And whenever an order is made by the court for winding up, all actions and suits are to be stayed, and the remedy of winding up then becomes the exclusive remedy. In the process of winding up, the court is to have regard to the wishes of the creditors or contributories. In order to cooduct the proceedings in winding up, and to assist the court, official liquidators may be appointed by such court, and the liquidators are thereupon invested with full powers to bring and defend actions, sell property, and do ail things necessary for winding up the company's

company's debts, and whether the other members affairs, and may appoint a solicitor to assist in performing these duties. The court, also, after an order to wind up, settles a list of contributories, i. e., of all persons who are bound to contribute to pay the debts of the company, also makes calls on such contributories, and may summon suspected persons who have property of the company. Besides a compulsory winding up of a company, there is also a power of voluntary winding up, whenever a special resolution has been passed to that effect, or when the company has found its liabilities too great to allow it to go on. Liquidators are then appointed with the same powers as in the other case. There is also the same powers as in the other case. a third mode of winding up, which is called a winding up subject to the supervision of the court. The liquidators have power to compromise calls and liabilities to calls, as well as debts present or future. upon such terms as may be reasonable. And where directors have misapplied moneys, or been guilty of breach of trust, the court, notwithstanding he is criminally responsible, may compel him to repay moneys so misapplied. The court may also order directors or officers of the company to be prosecuted, and the costs to be paid out of the assets.

5. Registration.—The appointment of registrars of

joint-stock companies is made by the Board of Trade, and there must be at least one office for registration in each of the three kingdoms. Every person is entitled to inspect the documents kept by the registrar on paying a fee not exceeding one shilling, and he may require a copy or extract of documents at a fee not exceeding sixpence for each

Moreover, as regards other remedies, it is now a criminal offence for directors of companies to declare and publish fraudulent accounts; and not only are directors personally liable to third parties buying shares on the faith of such false reports, and suffering loss, but even the officials who knowingly contribute to these false reports, are also personally liable in damages.

JOINT TENANCY, in English Law, the ownership of land or goods along with one or more other persons. See Joint Owner.

JOINT TRADE, or ADVENTURE, means a partnership limited as to a particular undertaking, and not, as in the usual case, for a series of years or a definite period of time. Hence the parties so joining have not the same liabilities as ordinary partners of a firm. Thus, a partnership of this kind may be limited to the working of a patent. In all such cases, the rights and habilities of the parties are much less extensive than those of ordinary partnerships; but everything depends on the particulars of the contract made between them,

JOI'NTRESS, in English Law, means a lady who has a Jointure (q. v.) secured to her.

JOINTS, in Anatomy. A joint or articulation may be defined to be the union of any two segments of the skeleton of an animal body, through the intervention of a structure or structures of a different nature. The textures which enter into the formation of the more complex joints are bone, cartilage, fibrocartilage, ligaments, and synovial membrane. Bone forms the fundamental part of all joints; ligament, in various modifications, is employed as the bond of union between the bony segments; while the three remaining textures chiefly occur in those joints in which there is free motion. The joints vary in the degree of motion from almost perfect immobility to the greatest amount and extent of motion that are compatible with the maintenance of the bony segments in their proper relation with each other.

Joints have been divided by anatomists into two great classes, to which the terms Synarthrosis and

Diarthrosis are applied. In synarthrosis, the parts are continuous—that is to say, there is no synovial sac intervening between the bones; and the joints belonging to this class are so very limited in their motion as to be considered by some as immovable; while in diarthrosis, the articular surface of each of the bones is covered with cartilage, and between these cartilaginous plates is a synovial sac; and mobility is the distinguishing feature of this class of joints. In briefly describing the leading varieties of these two classes of joints, we shall, as far as possible, avoid the barbarous terms which have been introduced into this department of anatomy.

In synarthrosis, the articulation is said to be by suture when the bones seem to grow somewhat into one another, and to become interlocked and dovetailed together, each bone having a jagged or serrated margin, or when there is a degree of bevelling of one bone, so that it is overlapped by the other. Both these kinds of suture are at once seen in the human skull, the serrated suture being well seen in the union of the two parietal bones, the bevelled suture being shewn in the overlapping of the temporal bone above the side of the parietal, and a combination of the two being exhibited by the coronal suture between the frontal bone and the anterior edges of the parietal bones. In all these there is a thin ligamentous membrane interposed between the bones, which disappears as the growth of the cranium becomes completed.

When a slight amount of motion of one bone upon another is required to be combined with great strength, the contiguous surfaces of the bones are united by a thick and strong layer of fibro-cartilage, with which a little elastic tissue is intermixed. This is an intermediate variety between the two classes of joints, but approximates most nearly to synarthrosis. As examples of this kind of joint, may be mentioned the acticulation between the bodies of the vertebre and that between the two public bones at what is termed the symphysis. See Pelvis.

In diarthrosis, the degree and nature of the motion are very various. There may be merely a little gliding motion between the ends of the bones, as, for example, in the articulations between the various bones of the carpus and tarsus. See HAND and Foor. In these cases, the surfaces are plane, or one is slightly concave, and the other slightly convex; and the motion is limited in extent and direction by the ligaments of the joint, or by some projecting point of one of the bones. In some cases, instead of a slight concavity and convexity, one bone pre-sents a cup-like depression, while the termination sents a cup-like depression, while the termination of the other assumes a hemispherical, or more or less globular shape. Hence the name of bold and socket that is applied to such joints. The best example of this variety is the Hip-joint (q. v), and the next best is the shoulder. In these joints, the ball is kept in apposition with the socket by means of what is termed a copositor ligament, which may be described as a barrel-shaped expansion of ligamentous structure, attached by its extremities around the margin of the articular surfaces composing the joint, and forming a complete investment of it, but not so tight as materially to restrict its movements. This species of joint is capable of motion of all kinds, as any one may readily test for himself, especially in the shoulder-joint.

Another important variety of articulation is the hinge-joint, in which the contiguous surfaces are marked with elevations and depressions, which examples of this variety. The knee-joint is a less Ankylosis (q. v.) is applied.

perfect example, because in certain positions it is capable of a slight rotation. These hinge-joints are always provided with strong lateral ligaments. The shells of bivalve molluses are united by a very strong and perfect hinge-joint.

The last kind of joint requiring notice is that which admits only of rotatory motion. A pivot and a ring are the essential parts of this joint, the ring being generally formed partly of bone and partly of ligament. The best example of this articulation is that between the atlas (the first vertebra) and the odontoid or tooth-like process of the axis (the

second vertebra). See Hand.

Diseases of the Joints.—Formerly, all the severer forms of diseases of the joints were vaguely designated under the one general term white swelling; but during the last half century, thanks to the labours of modern surgeons, amongst whom the name of the late Sir Benjamin Brodie stands prominently conspicuous, the diseases of the joints are tolerably well understood, and can be discriminated from one another with very considerable accuracy.

In diseases of the joints, we may have one or more of the following textures affected: (1), the synovial membrane; (2), the cartilage; and (3), the

bones themselves.

The synovial membrane may undergo either acute or chronic inflammation, giving rise to the serious affections known as acute and chronic Synovitis

Loose substances of a fibrous structure, and usually resembling a small bean in size and shape, sometimes occur in joints, especially in the knee-joint. They commence as little pendulous growths upon the synovial membrane, which after a time become detached. When they get between the ends of the bones, which they are apt to do during exercise, they cause a sudden and often a most excruciating pain, which is often followed by inflammation, and arrest all motion of the joint. These symptoms are not relieved till, by gentle flexion and manipulation, the loose cartilage (as it is usually termed) has been removed to a position in which it ceases to give annoyance. When the displacement of the loose body is only occasional, and does not cause intensely severe pain, the treatment should be limited to the application of an elastic bandage or a tightly fitting knee-cap, which should be constantly worn, with the view of restraining the loose body to a position in which it is inoffensive. If, however, this palliative treatment fails, the offending body must be the treatment rais, the orienting body must be removed by sub-cutaneous incision, which avoids the danger of a direct wound into the joint.

The cartilage may be affected in various ways.

There may be (1) simple destruction of cartilage; (2), scrofulous destruction of cartilage; (3), hypertrophy of cartilage; (4), atrophy of cartilage, and other modified forms of disease of this texture, all of which, especially the second, are of a very serious character, but not of a nature that admits of popular

explanation.

The most important diseases of the osseous structures of the joints are (1) ulcer and (2) earies. These diseases often, but not always, begin with the dis-organisation of cartilage, and then extend to the hones. Sometimes, however, they commence in the bones. The consideration of the symptoms and general treatment of these diseases would be out of place in these pages, but a reference to one very important mode of treating articular caries will be found in the article RESECTION OF JOINTS. Several of the preceding diseases, even when the result of marked with elevations are expressions, when our precured descend the market with the exactly fit into each other, so as to restrict motion of restrict motion of direction. The elbow and ankle joints and la extend amount of stiffness of the joint gometimes the joint of the fingers and toos, are the best extending to perfect immobility, by which the term

JOI'NTURE, in English Law, means an estate or some interest for life or a longer period in an estate settled upon a wife, in the event of her surviving her husband. The jointure was at first adopted as a substitute for Dower (q. v.), and dower is barred if a jointure is provided. The requisites of a jointure arc: 1. That it must commence and take effect immediately on the husband's death; 2. It must be for the wife's life, or for some greater estate; 3. It must be given to the wife herself, and not merely to trustees for her; 4. It must be expressed to be made in satisfaction of her whole dower; 5. It must be made before marriage. The mode of giving a jointure is usually by way of a rent-charge on the husband's real estate, the effect of which is to allow her to remain in possession of the estate, or part of it, after the husband's death, so long as she lives. If a jointure be created out of an estate before marriage, the husband cannot sell the estate afterwards, so as to defeat the jointure. A jointure is not lost by the treason or felony of the husband, nor by the elopement and adultery of the wife.

In Scotland, the word jointure is also frequently used in a similar sense to denote a conventional provision to a widow, consisting either of an annuity to her or of a liferent assignation of rents, or of a liferent of lands, called a locality. In whatever way the jointure is constituted, it also excludes the widow's terce, unless it is otherwise expressed.

JOINVILLE, JEAN, SIEUR OF SIRE DE, one of the earliest French historians, whose works possess much interest or value, was born about 1224, of an old family, in Champagne, and held high offices under Thibaut IV., king of Navarre. In 1248, he joined Louis IX. of France with nine knights and 700 armed men in his crusade; shared that monarch's captivity; and returning to France in 1254. was frequently at his court, but declined to accompany him in his second crusade. After the death of Louis IX., the Sicur de J. wrote his Histoire de St Louis, one of the most valuable works in the whole literature of the middle ages, combining an excellence of style then very rare with a most interesting exhibition of individual character in the minute record of events. He died about the year 1318. The Histoire de St Louis was first published at Poitiers in 1546; the latest edition is that of F. Michel (Paris, 1858).

JOISTS, horizontal timbers (of lighter scantlings than the beams) used to support floors. See FLOORS.

JO'LIBA. See NIGER.

JOLLY-BOAT (Dutch, jolle, a yawl), a small boat kept on board ship for the purpose of com-municating with the shore. It is a broad, safe

boat, and is specially devoted to the use of the steward and to the conveyance of his purchases from shore.

JOMINI, HENRI, BARON, born 6th March 1779

military career in a Swiss regiment in the Freuch service, and afterwards, chiefly through the friend-ship of Ney, was raised to high military rank by snip of Ney, was raised to high multary rank by the Emperor Napoleon. In 1804, he began the publication of his Trailé des Grandes Opérations Militaires. He distinguished himself in active service during the retreat from Russia, but offended at the treatment which he received from Napoleon, he passed over to the allies after the armistice of Plaeswitz, and entered the service of Russia. In 1828, he took an active part in the military operations at Varna; and in 1855 he settled at Brussels. Besides the work already mentioned, his Histoire Critique et Militaire des Campagnes de la Révolution (5 vols. Paris, 1806), his l'ie Politique et Militaire de Napoléon (4 vols. Par. 1827), and his Tableau Analytique des Principales Combinaisons de la Guerre (Petersb. 1830) are of great value to the military student. He died in 1869.

JO'NAH (Heb. Yonah, a 'dove; 'Gr. Jonas), a Hebrew prophet, son of Amittai, was, as we learn from 2 Kings xiv. 25, a native of Gath-hepher, a town of Galilee in Zebulun, and not far from Phoenicia. He appears to have flourished about the second half of the 8th c. B. C., in the reign of Jeroboam II., and was probably, therefore, the earliest of those prophets whose writings are extant. It has been urged by Rosenmüller and other critics, that the miracle recorded in the book known under his name is not to be regarded as an historical fact. but only as an allegory, founded on the Phœnician myth of Hercules rescuing Hesione from the sea-monster by leaping himself into its jaws, and for three days and three nights continuing to tear its The design of the author in incorporating entrails this myth with the actual voyage of J., and the conversion of the heathen Ninevites, was, it is suggested, to bring out more vividly the truth, that God will not permit his merciful intentions to be frustrated by the disobedience even of a prophet. On the other hand, it has been thought by orthodox theologians generally, that the language of Christ (Matt. xii. 39-41; xvi. 4; Luke xi. 29), and the manner in which it is mentioned in Josephus and the Apoerypha, preclude the possibility of our supposing this miracle to be other than strictly historical. J. has been supposed by early authorities to have been the son of the widow of Zarephath (I Kings xvii. 24), also to have been the pupil of Elisha. J.'s tomb is shewn at Nebi-Yunns (Prophet Jonah), near Mosul. Leusden, Jonas Illustratus (Traj. 1692); Friedrichsen, Kritischer Ueberblick der Ansichten vom Buch Jonas (Altona, 1817); Rosenmüller, Proleg. in Jonam; also Notes on the Prophecies of Jonah and Hosea, by the Rev. W. Drake (Cambridge, 1853).

JONES, INIGO, a well-known English architect, was born in London in 1572. Of his early history, little is known till the time when the Earl of Pembroke, attracted by his great aptitude at drawing, sent him abroad for four years to study the master-pieces of architecture in France, Germany, and Italy. While in Venice, he paid particular attention to the works of l'alladio, whose style he introduced into England, whence we sometimes hear J. designated as the English Palladio. In 1605, he was employed by James I. in arranging the scencry, &c., for the masques of Ben Jonson, which were at that time the chief amusement of the court. Jonson afterwards satirised his fellow-labourer in Bartholomew Fair. In 1612, J. revisited Italy, still further to improve his style, and on his return to England was appointed surveyor-general of the royal buildings. J. was at this time accounted the royal buildings. at Payerue, in the cauton de Vaud, began his first architect of England, and according to some,

the first of the age. He died in 1653. The state of Menn (q. v.) appeared in 1794. He was busily of architecture in England during J.'s time was an excellent foil to his genius, as the praise bestowed upon his works shews, but still in any age he would have ranked high as an architect. His master-piece is considered to be the Banqueting House at Whitehall. Other works of his are the church of St. Paul. in Covent Garden, Ashbornham House, and Surgeons Hall, which, however, are very mediocre,

JONES, JOHN PAUL, born at Arbigland, in the stewartry of Kirkcudbright, Scotland, 6th July 1747, was the son of a gardener named John Paul. He became a sailor, was for a short time engaged in the slave trade, and afterwards settled in Virginia, assuming the name of Jones. He ardently embraced the cause of the American colonies. When the Congress, in 1775, resolved to fit out a naval force, he offered his services; and visiting the British coast in a brig of 18 guns, performed some remark-ably bold exploits, and took advantage of his familiarity with the scenes of his boyhood to make a hostile visit to the shores of the Solway Firth. In 1779, he was appointed to the command of a small squadron of French ships displaying the American flag, with which he again visited the British coasts, causing great alarm, and taking some prizes. The king of France made him a chevalier of the order of Military Merit. After the war was ended, J. attempted, along with John Ledyard, to establish a fur-trade between the north-west coast of America and China, but failed. In 1787, he accepted an appointment in the Russian service. and the command of a fleet at the mouth of the Dnieper, with which he took an active part in the Turkish war, but soon left the Russian service, He died at Paris, 18th July 1792. His funeral was attended by a deputation of the Legislative Assembly.

JONES, SIR WILLIAM, was born in London, 25th September 1746, and was sent to Harrow in 1753, where he soon eclipsed all his fellows, particularly in classical knowledge. In 1764, he was entered at University College, Oxford, where he was enabled to gratify that desire for a knowledge of the oriental languages which had shewn itself during the last two years of his residence at Harrow. In 1765 he left Oxford, to become tutor to the eldest son of Earl Spencer, with whom he remained five years. In 1770 he published, at the request of the king of Denmark, a Life of Nadir Shah, translated into French from the Persian: in the following year, a Persian Grammar, republished some years ago, with corrections and additions, by the late Professor Lee; and in 1774, his Commentaries on Asiatic Poetry, republished by Eichhorn at Leipsic, in In 1780, he completed a translation of seven Arabic poems, known as the Moallakat, which obtain their collective name from being 'suspended' in the temple at Mecca; wrote an essay On the Legal Mode of Suppressing Riots, and another, entitled Essay on the Low of Bailments, and two or three odes. In March 1783, J. obtained a judgeship in the Supreme Court of Judicature in Bengal, and landed at Calcutta in September. He at once set about the acquisition and promulgation of the knowledge of oriental languages, literature, and customs. He established the Royal Asiatic Society, 'for investigating the history, antiquities, arts, sciences, and literature of Asia, of which he was the first president. To the volumes of the Asiatic Researches, Sir William contributed largely. Besides these, he wrote and published a story in verse, called The Enchanted (1898). The best of his subsequent productions and published a story in verse, called The Enchanted (1898). The best of his subsequent productions are Fruit, or the Hindu Wife; and a translation of an Volpone, or the Fox (1993), The Silent Woman (1609), ancient Indian drama, called Accountale, or the Fatal and The Alchemist 1810. These are comedia; and little, A translation by him of the Ordinances of rich, dry, carefully-elaborated 'humour.' He 738

employed on a digest of the Hindn and Moham-medan laws, when he was attacked with an inflammedan laws, when he was attacked with an inham-mation of the liver, which terminated fatally on the 27th April 1794. J. was one of the first linguists and oriental scholars that this country has produced. The East India Company erected a monument to his memory in St Paul's Cathedral, and a statue in Bengal A complete edition of his works, in 6 vols. 4to, was published by Lady Jones in 1799; and another appeared, in 13 vols. Svo, in 1807, with a life of the author by Lord Teignmonth.

JONE'SIA, a genus of trees of the natural order Leguminosa, sub-order Casalpinica, having a twoleaved calyx, a funnel-shaped. 4-fid corolla, seven stamens attached to a ring which springs from the tube of the corolla, a scimitar-shaped pod. leaves are abruptly pinnate. The Asoca of Sanscrit poetry (J. Asoca) is one of the loveliest trees of the East. Its orange and crimson flowers grow in graceful racemes. Indian poetry abounds in its

JÖNKÖPING, a town of Sweden, and one of the most beautiful and finely situated in the country, is capital of the læn of the same name, and stands at the sonthern extremity of Lake Wetter, and is backed on the south and west by pine-clad hills. It is a maritime and trading town, and contains an arsenal and a factory for arms. Pop. in 1869, 10,810.

JONQUIL (Fr. jonquille, from Lat. juncus, a rush), a name given to certain species of Narciscus (q. v.) with rush-like leaves. The Common J. (N. Jonquilla), a native of the south of Europe, is one of the most common bulbous-rooted plants in our flower-borders. It has from two to six yellow flowers at the summit of its scape (leafless stem). The Sweet-scented J. N. odorus), also a native of the south of Europe, is another species very generally cultivated. Perfumed waters are made from J.

JONSON, BEN, or BENJAMIN, an English dramatist, was born, according to the most reliable accounts, at Westminster, though one authority savs Warwickshire, in 1574. The Scottish poet Drummond of Hawthornden, states that J. told him his grandfather was a Scotchman of Annandale, who settled in Carlisle, and his father a clergyman, who died before Ben was born. The latter received his education at Westminster school, where he had for his preceptor the illustrious Camden. Our knowledge of his career from this point until the period when he became famous as an anthor is very obscure. It is said that his mother took a second husband, a bricklayer (but this is doubtful), and that Ben was forced very unwillingly to assist his stepfather. The story of his residence (for a few months; at St John's College, Cambridge, may be an authentic tradition, but it really rests on no better evidence than the present of some books now in the library of that college with his name inscribed on them. If he went thither at all, he was soon forced to return home for want of means; but his antipathy to the trade of a bricklayer was so great, that he finally ran off, and served as a soldier in the Low Countries for some time. After coming back to England, he tried the profession of an actor, but did not succeed, whereupon he started as a writer for the stage. Even in this capacity he did not rapidly acquire a reputation. The first piece that procured him a name was Every Man in his Humour (1598). The best of his subsequent productions are

also composed two tragedies, Sejanus (1603) and a course of 150 miles, having passed through the Catilité & Conspirace (1611), on which he—but only small lake of El Illelei (The Waters of Reron) ho—set a high value. His Masques, written for and the Lake of Therias (Sen of Galilee), it follows the courts of James and Charles, are occasionally very graceful. For many years J. was in receipt of a pension from these monarchs, but his carcless and profuse habits involved him constantly in difficulties, and he died in poverty 6th August 1637. J.'s writings are not much relished now, and never were, even in his own day. There is an air of pedantry about his happiest efforts that spoils their effect. Yet, on the other hand, he possesses a rude force, and a humour which, if heavy and saturnine, is also genuine and pungent. Occasionally, too, his lyrics shew a lightness and delicacy almost inexplicable considering the ordinarily cumbrous move-ment of his faculties. The influence which he ex-ercised over the wits of his time is a proof of the general strength and talent of the man. Shakspeare alone was reckoned his match in those wit-combats held at the Merinaid Tavern. He was an immense drinker, and his potations do not seem to have improved either his temper or his constitution. The best edition of his works is that by Gifford, accompanied by a biographical memoir (Lond. 9 vols. 1816); the latest is that by Barry Cornwall, puhlished by Moxon (Lond. 1838; 3d ed. 1853).

JO'PPA, the name given in the Greek of the New Testament to a town called in Hebrew Vafo; modern, Fafa or Jaffa, i. e., beauty. It is situated on the sea-coast of Syria, about 33 miles northwest of Jerusalem, and, according to Stanley, still deserves its name. J. is a place of great antiquity. Here, according to the classical myth, it was that Andromeda was chained to the rock, and exposed to the sea-monster; a story that has been supposed to shadow out in an obscure way the early intercourse between Greece and Syria. In sacred history, it appears as the port of Jerusalem in the time of David and Solomon, and the place to which the cedars of Lebanon were floated place to which the centars of Lecanon were maked from Tyre for the building of the temple. It was at J. that the Apostle Peter saw the vision which corrected his Jewish prejudices concerning the Gentiles and the spirit of Christianity. the reign of Constantine the Great, J. was made a bishop's see, but it attained its highest prosperity in the times of the Crusades, when it became the dom. In 1799, it was stormed by the French under Bonaparte, and here was perpetrated his shameful massacre of Turkish prisoners. In 1832, Mohammed Ali made himself master of it; but the Turks, with the assistance of the British and Austrians, took it from him again in 1840. The modern Jaffa is within the pashalie of Gaza. Its wrotehed harbour is nearly sanded up, and it has very little trade. Pop. about

JORDAENS, JAKOB, a celebrated Dutch painter, was born at Antwerp in 1594, and died in 1678. His works are exceedingly numerous, and are to be found in most European collections. They are marked by great truthfulness and vigour of por-Their chief defects are a want of taste and elegance in design. Among his best known works are the 'Merry making,' the 'Satyr and Man blowing Cold and Hot,' 'Pan and Syrinx,' and 'Saturn devouring his Children.

AO'RDAN, the principal river of Palestine, the bed of which forms a great valley, stretching from north to south in the eastern part of the country. The J., deriving its head-waters partly from the eastern branches of the Lebanon Mountains, and

into the northern extremity of the Dead Sea (q, v.). The bed of the river varies much in breadth, and its banks are in some places flat, oceastin, and its onlines are in some places flat, in others, steep. Where it enters the Dead Seo, it is 180 yards broad, and 3 feet deep; but a little way further up, it is only 80 yards broad, and 7 feet deep. From the Lake of Tiberias to the Dead Sea, the J. is crossed by no bridge, atthough in two or three places there are ruins of bridges. Above the Lake of Tiberias is a bridge ealled Jacob's Bridge, over which the road from Damascus to the sea-coast passes. In a number of places, the J. is fordable; in some, even when the places, the 3. is formable; in some, even when the river is in flood. The course of the J. was explored by Lieutenant Molyneux, an English officer, in August 1847, during the dry season; and by Lieutenant Lynch, with an expedition sent out by the United States' government in April 1848, when the river was in flood.

JORGENSEN, JORGEN, a Danish adventurer, who, in the heginning of the present century, made a descent on the island of leeland, and reigned there as protector for about six weeks, was the son of a watchmaker in Copenhagen, and was born in that city in 1779. On the 21st June 1809, having previously visited the island in a ship in which he held the position of interpreter, J. arrived at Reikiavik in the Margaret and Ann, an armed merchantman from London, earrying 10 or 12 guns. A few days after, he surrounded the house of the governor, took him prisoner, and informed the town's-people that he should hold Iceland in possession for England, 'until such time as the English fleet should relieve him.' He then issued several proclamations, announcing 'that relations with Great Britain should be set on a firm footing, and leeland Britain should be set on a firm tooling, and reciant be placed under her protection. He also organised a 'government office,' confiscating all Danish property, with whatever else he could lay hands on, to the state chest, and subjecting the inhabitants to all the miseries of an unscrupulous despotism. On the 9th August, however, his brief reign was brought to a close by the arrival of a British man-of-war, the commander of which, hearing of the piratical invasion of J., immediately seized upon and imprisoned him, restoring at the same time the previous condition of affairs. J. was earried to England, but he does not seem to have been visited by the punishment he so fully merited. He afterwards lived in London for some years, was convicted of robbery in 1820, and transported to Botany Bay in 1825.

JORNA'NDES, or JORDANES, a historian of the 6th e., was by birth a Goth, or both of Alan and Gothic descent. He was first a notary, but afterwards adopted the Christian religion, and was made Bishop of Croton, in Italy. He wrote two historical works in the Latin language; the first, De Requorum ac Temporum Successione, is a short compendium of the most important events in history from the ereation down to 552 A.D.; but the work is only valuable from the accounts in it of several barbarous northern nations. His other work, De Getury.n Origine et Relais Gestis (Concerning the Origin and Deeds of the Goths), is a work which has obtained great renown, chiefly from its being our only source of information about the Goths and other barbarian tribes, except when they are easually mentioned by some Creek or Latin historian. The work is, how ever, full of inaccuracies, both of time, place, and person. There are many editions of both works.

JORU'LLO, a volcanie mountain in the Mexican partly from Mount Hermon, flows south, and after Confederation, situated 150 miles west-south-west of the city of Mexico, was thrown up, in September 1759, to the height of 1375 feet from a plam, which itself was 2890 feet above the level of the sea; lat 19°10 N. long 10°12 °W. This new creation originally consisted of a series of cones of various sizes. Many of the subordinate canniences have since disappeared altogether; some have the contract of the contract

JOSEPH L, Emperor of Germany, the eldest son of Leopold L, was born at Vienna 26th July 1678, was crowned king of Hungary in 1689, and king of Rome in 1690, became emperor in 1705, and died in 1711. The influence of the Prince of Sahn, who had the charge of his education, and his subsequent connection with Prince Eugene, led him to embrace opinions much more liberal than those which have goverally prevalled in his doubt leading to generally prevalled in his doubt leading to generally prevalled in his fact that the subsequent connection with the property of the property of the property of the property in 1707 with Charles XII. of Sweden, by which he granted religious liberty to the Protestants of Silesia, and restored to them 120 churches which had been taken from them by the Jesuits. He was fond of courtly cereaming, but mild and affable, and sought to improve the condition of the pessantry in his dominions by which they were subject. He eagerly and successfully presecuted, in alliance with Eritain, the war of the Spanis Succession against France.

JOSEPH II., Emperor of Germany, son of Francis I. and Maria Theresa (q. v.), was born 13th March 1741, at a time when his mother's fortunes were in their lowest state of depression. He early gave proof of excellent abilities. After the peace of Habertsburg, he was elected king of Rame, and after the death of his father (18th August 1765), emperor of Germany. Maria Theresa also asso-ciated him with herself in the government of the Austrian states; but for some time his actual share in it amounted to little more than the chief command of the army. On her death in 1780, he inherited all her dignities and power. He was ambitious of increase of territory, and although he failed in his object of adding Bavaria to the Austrian dominions, which he thought to consolidate by obtaining it in exchange for the Low Countries, yet he was successful in acquiring Galicia, Lodomeria, and the county of Zips, at the first partition of Poland, in 1772; and he appropriated, in 1780, great part of the bishoprics of Passau and Salzburg. He was a zealous reformer, having imbihed, like Frederick the Great, the principles of the philosophy which prevailed in that age, but he attempted his reforms too rashly, and too much by the exercise of mere authority, and was compelled to restore many things again to their former condition; the hostility of the nobles and clergy, whose power and privileges he sought to reduce, producing rebellions in various parts of his dominioas. The clergy in particular regarded him with detestation. He had early shewn a dislike to them, which caused no little vexation to his mother; and as seen as he found himself in full possession of the government of Austria, he proceeded to declare himgovernment of Austria, he proceeded to necesser num-self independent of the pope, and to prohibit the publication of any new papal bulls in his dominions without his Placet regions. The continued publica-tion of the bulls Unipentus (q. v.) and In cond Domini (q. v.) was also prohibited. Besides this, he suppressed no fewer than 700 convents, reduced the

on 15th October 1781, published the celebrated Edict of Toleration, by which he allowed the free exercise of their religion to the Protestants and Notunited Greeks in his dominions. Pope Pius VI. thought to check this course hy a personal interview with the emperor, and for that purpose made a yight

with the emperor, and for that purpose made a visit to Vienna in 1782; and although he was quite unsuccessful in his object, he carried away with him the conviction, that the people were atterly unprepared for the reforms which their sovereign sought to accomplish, a conviction the correctness of which the event abundantly proved. J. engaged in a war with Turkey in 1785, in which he was unsuccessful; and the excation caused by this, and by the revolts in his own dominions, and the necessity under which he felt himself of revoking many of the edites by which he had sought to promote the welfare of his people, hastened his death, which many valuable institutions, and did much to promote the progress of arts, manufactures, and commerce in Austria.

JOSEPHINE, MARIE Rosg, Empress of the Franch, was born, 23d June 1763, in the island of Martinique, where her father, Tacher de la Pagerie, was captain of the port at 8t Pierre. She had only an indifferent colonial education; but her qualities of mind and heart, even more than her beauty, won universal regard. When about 15 years of age, she came to France, and soon after married the Viscount Alexandre Beauharnais; of which marriage were born Eugene, viceroy of Italy, and Hortense, queen of Holland, and mother of the Emperor Napoleon III. J.'s husband having been executed during the Reign of Terror, she herself just escaped through the events of 9th Thermidor (27th July 1794). She was married, 9th March 1796, to Napoleon Bonaparte, accompanied him in some of his campaigns, and exercised a great influence in restraining him from measures of violence and severity. At Malmaison, and afterwards at the Luxembourg and the Tuileries, she attracted round her the most brilliant society of France, and contributed not a little to the increase of her husband's power. She regarded his exaltation to the throne, however, with a presentiment of evil; and from the day of her becoming empress, seemed to dread that political metives might lead him to seek the dissolution of a marriage which had proved unfruitful. After scenes of the most painful kind, this took place. The marriage was dissolved by law on 16th December, 1809. J. retained the title of empress, corresponded with Bonaparte, and if the allied sovereigns had permitted, would have rejoined him after his fall. She lived near Evreax, and died, after a short illness, on 29th May, 1814. Compare Histoire de

age, our he attempted nis retorms too Tasiny, and to moth jut he exercise of more authority, and was compelled to restore many things again to their former condition; the hostility of the nobles and clergy, whose power and privileges he sought to reduce when the proper may be a sought to reduce the condition. The clergy in particular regarded him with the property in particular regarded him with described to the property in particular regarded him with described to the property in particular regarded him with described to the property in particular regarded him with described to the property in particular regarded him with described to the property in particular regarded him with described to the property in particular regarded him with described to the property of the property of the property in the first of the twenty-government of Austria, he proceeded to declare him-safe priority and the property of the prope

returned to Jerusalem, and henceforth belonged to the body of the 'l'harisees,' which, in fact, comprised the bulk of the people. So great was the regard for his abilities, that at the age of only twenty-six years he was chosen delegate to Nero. When the Jews rose in their last and fatal insurrection against the Romans, J. was appointed governor of Galilee. Here he displayed the greatest valour and prudence; but the advance of the Roman general Vespasian (67 A. D.) made resistance hopeless. The city of Jotapata, into which J. had thrown himself, was taken after a desperate resistance of 47 days. Along with some others, he concealed himself in a cavern, but his hiding-place was discovered, and being brought before Vespasian, he would have been sent to Nero, had he not—according to his own account, for J. is his own and his sole biographer—prophesied that his captor would yet become emperor of Rome. Nevertheless, he was kept in a sort of easy imprisonment for about three years. J. was present in the Roman army at the siege of Jerusalem by Titus; and after the fall of the city (70 A. D.), was instrumental in saving the lives of some of his relatives. After this, he appears to have resided at Rome, and to have devoted himself nave resumed at Rome, and to have devoted himself to literary studies. The exact period of his death is not ascertained. All we know is, that he sur-vived Agrippa II., who died 97 A.D. He was thrice married, and had children by his second and third wives. His works are: History of the Jewish War, in 7 books, written both in Hebrew and Greek (the Hebrew version is no longer extant); Jewish Antiquities, in 20 books, containing the history of his countrymen from the earliest times down to the end of the reign of Nero (the fictitious Hebrew Josippon, which for a long time was identified with J.'s Autiquities, dates from the 10th c. A.D.); a treatise on the Autiquity of the Jews, against Apion, in 2 vols., valuable chiefly for its extracts from old historical writers; and an Autobiography (37-90 A.D.), in one book, which may be considered sup-plementary to the Antiquities. The other works attributed to him are not believed to be genuine.

The peculiar character of J. is not difficult to describe. He was, in the main, honest and veracious; he had a sincere liking for his countrymen, and rather more pride and enthusiasm in the old national history than he could well justify; but the hopelessness of attempting to withstand the enermous power of the Romans, and an aversion to martyrdom, caused him to side with the enemy:perhaps in the faint hope of being thus of some use to the national cause. The influence of Greek philosophy and learning is visible in all his writings, and, as far as biblical history is concerned, infused into it a tone of 'rationalism.' He speaks of Moses as a human, rather than a divinely inspired lawgiver; he doubts the miracle in the crossing of the Red Sea; the swallowing of Jonah by the whale; and, generally speaking, whatever is calculated to teach that there was a special miraculous Providence at work on behalf of the chosen people. style is easy and elegant, and J. has often been called the Greek Livy. The editio princeps of the Greek text appeared at Basel (Froben) in 1544. Since then, the most important editions (with notes) are those of Hudson (Oxford, 1720), Havereamp (Amst. 1726), Oberthur (Leip. 1782-1785), Richter (Leip. 1825-1827), and Dindorf (Paris, 1845). J. has been frequently translated; the two best known versions in English are by L'Estrange (Lond. 1702) and Whiston (Lond 1737).

JO'SHUA (Heb. Yehoshua, 'Jehovah helps'), the name of the celebrated Hebrew warrior under

whose leadership the land of Canaan was con-quered. He was the son of Nun, of the tribe of

Ephraim, and was born in Egypt. Before the Israelites had reached Sinai, he was chosen by Moses to command the troops that fought against Amalek; and shortly before the death of the great lawgiver, he was publicly invested by the latter lawgiver, he was publicly invested by the matter with the whole civil and military government of the Israelites. The vigorous and, on the whole, successful manner in which he pursued the conquest of Canaan, and distributed the land among quest of Canaan, and distributed the hade among the tribes, is minutely described in the book which bears his name. He died at the age of 110, and was buried at Timnath-Scrah, in Ephraim.—The so-called Book of Joshua, in its present form, containing an account of the conquest and division of the 'Land of l'romise,' was neither written by him nor by any of his contemporaries; but the compiler has certainly made copious use, especially in the earlier chapters, of documents drawn up during the period of the conquest. Such passages as that relative to the harlot Rahaband she dwelleth in Israel unto this day' (vi. 25) -demonstrate their own antiquity; but on the other hand, such passages as the narrative of the capture of Hebron (of which there are several), which did not take place till after the death of J.; the frequency of the expression, 'unto this day,' in connections that forbid us to suppose the interval a brief one; the allusion to Judah and Israel as distinct (xi. 21); the lateness of many of the grammatical forms, &c., clearly indicate the gradual growth of the book under successive editors, the last of whom is placed by Masius, Spinoza, Hasse, &c., after the exile, and by Ewald in the time of Manasseh; while Keil and others place the book in the time of Saul. A Samaritan Book of Joshua (Chronicon Samaritanum), containing a chronological narrative of events from the death of Moses down to the time of the Roman emperor Hadrian, compiled from Arabic and Hebrew sources, about 1300 A.D., is extant in Arabic, and was first edited at Leyden in 1848, by Juynboll, along with a Latin version. It differs very considerably from the canonical Book of Joshua.

JOSI'AH (11ch. Yoshiyahu, 'Jehovah will help'), one of the kings of Judah, was the son of Amon and Jedidah, and succeeded his father (641 n. c.) at the age of eight years. He was apparently brought up under the eare of the priesthood, early manifested a pious disposition, and became a determined religious reformer, purging Judah and Jerusalem from idolatry. In like manner, it seems, he marched through the land of Israel. This statement has naturally excited much surprise. For more than a hundred years, the kingdom of Israel had been a part of the Assyrian empire; its people were, for the most part, carried into exile, and their place sup-plied by heathen colonists. It was in the reign of J. that Hilkiah the high-priest found the 'Book of the Torah'—by which some understand Deuter-onomy, others Exodus, and others, again, the whole Pentateuch-while the workmen were repairing the temple. J. does not appear to have heard of its existence before; at least, the words of it strike him as something novel, and excite the profoundest emotions in his breast. In commemoration of the discovery, the king celebrated the feast of the Passover with a splendour never before equalled. After this, he continued his work of extirpating every trace of idolatry. Wizards, conjurors, 'all the abominations' that could be 'spied in the land,' were 'put away.' In these efforts, the monarch were 'put away.' In these efforts, the monarch seems to have spent the greater part of his reign. He met his death at Megiddo, in the valley of Esdraelon, when attempting to check the advance of Pharaoh-Necho against the Assyrians. (Compare Herod. 1L 159.) J. was the last of the good kings of Judah. In his days prophesied Jeremiah and Zephaniah.

JOSIKA, MIKLOS (NICHOLAS), a very remarkable Hungarian novelist, was born of a distinguished family, 28th September 1796, at Torda, in Transylvania. In his youth, he served for some time in the Austrian army, but resigned his commission in 1818, married a wealthy Hungarian heiress, and for many years devoted himself to agriculture and study. his first works appeared in 1834 under the title of Iring and Vazlatok, and were exceedingly popular. From that period till the revolution in 1848, he From that period till the revolution in IS48, he wrote about 60 volumes of novels, all of which were published at Pesth. The most important are 4x valols Bathor y (The Last Bathory, 3 vol. 1840), Zrinyi a Kötto (The Poet Zrinyi, 4 vols. 1843), A Cachek Magyproroxidpm (The Bohemians in Hungary, 4 vols. 1845), and Jösika Istoia (Stephen Last All Caches Josika-one of the author's ancestors-5 vols. 1847). Involved in the Hungarian revolution, he was obliged to abandon his native country, and retired to Brussels, where he continued to reside until his death, which occurred in 1865. Among his productions written in exile, the best are Egy Magyar Családa forra-dalom Alatt (A Hungarian Family during the Revolution, 4 vols. 1851); The Mailly Family (2 vols. 1850); and Exter (Esther, 1853). J. is a thoroughly natural novelist, and has drawn his materials almost wholly from the history of his own land, of which he possessed a most minute and profound knowledge. He has been called the Walter Scott of Hungary.

JOST, ISAM MARKUS, an eminent Jewish scholar of Germany, born at Bernburg in 1793, died 1862. His principal works are Geskichte der Israeliten (History of the Israelites, 9 vols. Berl. 1820–1829, to which was added a tenth during 1846–1849, entitled Neuere Geskichte er Israeliten vorsal History of the Jewish People, 2 vols. Berl. 1849; Allyenacine Geskichte des Jüd. Folkes (Universal History of the Jewish People, 2 vols. Berl. 1831–1832); a Translation (into German) of the Mislam with text and commentary (6 vols. Berl. 1832–1834); Gesch. des Judenthums, &c. (3 vols. Leipsic, 1857–1859). He also edited a journal entitled Israelitische Annalem (Fikf. 1839–1841). Besides being a savant, he was a patriot, and warmly interested himself in behalf of the social and volitical liberties of his countrymen.

JOUDPO'RE, a city in Rajpotana, Hindustan, capital of a protected state of the same name, stands in lat. 26° 19 N., and long, 73° S. R. The population, not accurately ascertained, appears to amount to at least 30,000. Besides several magnificent tanks, the place is remarkable for its elaborately constructed and deep wells. The state of all the principalities of Rajpotana. Area, 33,672 square miles; pop. 17,83,600; a rmy, 11,000; revenue of the rajah, £180,000. J. is chiefly within the basin of the Luni; and its central parts, being level and well watered, are highly productive, vielding wheat, owner, and constructive.

JOUTFFEOV, Thisonone Shrox, a French philosephy, and properly and both sequences of the Jura, early devoted himself to the study of constructing for philosophy, and became a teacher of it, and in 1832 of the Jura, early devoted himself to the study of constructing for philosophy, and became a teacher of it, and in 1832 at a professor in the Collège de France. His bad health genius, His early compelled him to resign his professorship in 1837, with reference to and he died lat March 1842. His works consist which he passe chiefly of studies of the Scottish philosophy, and regarding heat, a he published translations of the works of Reid forms of energy and some of those of Dugald Stewart with notes to be considered and introductions. Of his original works, the most valuable is Medagoge Philosophysius (1833). He was at generalisation also known as a political writer, and in 1824 took sketch of this pratrin establishing the newspaper Le Globe. He show exterred to

was for some time a member of the Chamber of Deputies, and was a follower of Guizot.

JOUGS, JUGGS, or JOGGS, the name given in Scotland to a form of pillorly which was used also in Holland, and probably in other countries. The jougs were nothing more than an iron riog or collar, fastened by a chain of two or three links to a pillor or wall in some public place, such as a market cross, or the property of the property

represents the jougs at the churchyard gate of the picturesque little hamlet of Duddingston, within about a nulle of Edinburgh. The jongs obviously take their name from a widely-spread root, which appears in the Sanser, ngl, the Gr. zugon, the Lat. juguan, the Hal. group, the Fr. jougn, the Ger. jock, the Ang-Sax. jocc, and the Eng. yoke. The Beants (q. v.) were occasionally hung on the same pillar with the jongs.

JOULE, JAMES P., one of the most distinguished living experimental philosophers, was born in 1818, at Salford, near Manchester. In his youth, he had the good fortune to have for instructor in science the celebrated Dalton; and he early shewed, by constructing for himself electrical machines and other philosophical instruments, the bent of his genius. His carliest notable experiments were made with reference to electro-magnite engines, from capaciting heat, and the transformation of various forms of energy (see Force). He is justly entitled to be considered as the experimental founder of the modern theory of conservation of energy—the grand-est generalisation ever made in physical science. A sketch of this principle is given in the article FORCE above referred to.

JOUNPU'R, a town in the North-west Provinces of India, is situated on both banks of the Gumti, which is here crossed by an ancient bridge, so strong which is here crossed by an ancient order, so strong as to be periodically submerged without injury. Lat. 25° 44′ N., long. 82° 44′ E. This structure is commanded by a fort still older than itself, a work of the latter half of the 14th century. The population is 16,000. J. is the capital of a district of the same name, with an area of 1552 square miles, and about 800,000 inhabitants. Sugar is largely

JOURDAN, JEAN BAPTISTE, COMTE, a French marshal, born 29th April 1762, at Limoges, where his father was a surgeon. He early entered the army, embraced with great zeal the cause of the Revolution, and soon rose to the rank of a general of division. In September 1793, he obtained the command of the Army of the North, and on 16th October gained an important victory at Wattignies. In 1794 and 1795, he commanded the Army of the Meuse and Sambre, and prosecuted the war with great vigour and success. In 1796, he pushed his way far into Germany, but was driven back by the Archduke Charles; and this discomfiture led to his resignation of his command. In 1799, the Directory intrusted him with the command of the Army of the Danube; but he was defeated by the Archduke Charles at Stockach. Although he opposed the coup-d'état of 18th Brumaire, the First Consul employed him, in 1800), in the re-organisation and administration of Piedmont; and on the establishment of the Empire in 1804, he was made a marshal, and a member of the Council of State. He accompanied King Joseph to Naples, and afterwards to Spain, and in his service he was actively employed as a general. He offered his services to Napoleon after his return from Elba. Louis XVIII. made him a count in 1815. In 1819, he was made a peer of France; but his republican principles led him to enter heartily into the revolution of 1830. He lived and died poor. His death took place on 23d November 1833.

JOUSTS, exercises of arms and horsemanship. performed in the middle ages by knights and nobles. In the jonst, the combatants engaged one another singly, each against his antagonist, and not in a troop, as in the Tournament (q. v.). The number of courses to be run and strokes to be given was generally three, but sometimes a larger number. The weapon most in use in the joust was the lance, but sometimes the battle-axe and sword were employed. To direct the lance anywhere but at the body of the antagonist, was reckoned foul play. In the joust of peace, or joute de plaisance, a footencounter preceded the mounted combat. 15th c., the usages of jonsting had come to differ in different countries to such an extent, that an elaborate treatise was written in explanation of the various modes, distinguishing the characteristic differences.

JOWLOPPED. See JELLOPPED. JUAN, DON. See DON JUAN.

JU'AN FERNA'NDEZ, called also MAS-A-TIERRA, a rocky island in the Pacific Ocean, about 400 miles off Valparaiso, on the coast of Chili, to which it belongs. It is 18 miles long, 6 miles broad, which it belongs. It is is a mice long, o mice broady, and is for the most part covered with high rocky peaks, the highest of which, Yungn, is about 4000 feet above sea-level. There are also numerons and fertile valleys, which yield oats, turnips, apples, strawberries, melons, peaches, figs, grapes, sandal-wood, and other varieties of timber. Numbers of wild goats wander on the cliffs. A few settlers from the United States and Tahiti hold the island

Alexander Selkirk, a bucaneer, from the fishingtown of Largo, in Fifeshire, Scotland, resided in solitude for four years (1704-1708). His story is commonly supposed to have suggested the idea of the Robinson Crusoe of Defoc, but this is doubtful.

JUBÆA, a genus of palms of the same tribe with the cocoa-nut. J. spectabilis is a palm of 30 or 40 feet high, with a wide-spreading crown of pinnate leaves; a native of Chili, where it is called Coquito. The Chilians cut off the crown, and collect the sap, which flows freely for several months, a fresh slice of the top of the stem being cut off every morning. A good tree will yield ninety gallons of sap, which being boiled down to a syrup of the consistence of treacle, receives the name of miel de pulma (palm-honey), and is an important article of the domestic economy of the country. The Jubaa is, in fact, the Jaggery (q. v.) palm of Chili.

JU'BILEE, THE YEAR OF (Heb. Yobel), a peculiar institution among the Hebrews (Leviticus xxv.), by which, every fiftieth (not forty-ninth) year, the land that in the interval had passed out of the possession of those to whom it originally belonged was restored to them, and all who had been reduced to poverty, and obliged to hire themselves out as servants, were released from their bondage; no less were (Jos. Ant. iii. 12. 3) all debts remitted. The jubilee forms, as it were, an exalted Sabbatical Year (q. v.), and the land was completely to be left to itself in the former as in the latter. The design of this institution was chiefly the restoration of the equilibrium in the families and tribes. It was to prevent the growth of an oligarchy of landowners. and the total impoverishment of some families; as well as to increase the fertility of the soil and the growth of the population. It was proclaimed at the end of the harvest-time, like the subbatical year, on the tenth day of the seventh month-the day of atonement-by the yobel (a kind of horn), hence also its name. There is no trace in the whole history of the Hebrews down to the Babylonian exile that the inbitce had ever been observed; after the return, however, it appears to have been rigorously kept, like the subbatical year, for some time at least; but, from its general impracticability, it must soon have fallen into disuse. When the sublatical year was de facto repealed by Hillel's Prosbol (a legal document entitling the creditor to claim his debt during this period), mention is no longer made of the yobel. The speculations of modern critics on the possibility of the yobel, and on the date of its inanguration, cannot prevail against the undeniable fact that it has been kept, and also that it is much more in harmony with the primitive theocratic character of the Mosaic institutions-according to which all the land was held as a kind of toan from Jehovah, who atone had an absointe right over it-than with those of any later period, to which it otherwise would have to be referred.

JUBILEE, or JUBILEE YEAR, an institution of the Roman Catholic Church, the name of which is borrowed from that of the Jewish jubilee. The Catholic jubilee is of two kinds "ordinary and extraordinary." The ordinary jubilee is that which is celebrated at stated intervals, the length of which has varied at different times. Its origin is traced to Pone Boniface VIII., who issued, for the year 1300, a buil granting a plenary indulgence to all pilgrim-visitors of Rome during that year, on condition of their penitently confessing their sins, and visiting the church of St. Peter and St. Paul, lifteen times if strangers, and thirty times if residents of the city. The invitation was accepted with marvellous enthusiasm. Innumerable troops of pilgrims from every under lease from the Chilian government. Here part of the church flocked to Rome. Giovanni

Villani, a contemporary chronicler, states that the constant number of pilgrims in Rome, not reckoning those who were on the road going or returning, during the entire year, never fell below 200,000. during the entire year, never feir octow 2000000. As instituted by Boniface, the jubilee was to have been held every hundredth year. Clement VI, in obedience to an earnest request from the people of Rome, abridged the time to fifty years. His jubilee accordingly took place in 1350, and was even more numerously attended than that of Boniface; the average number of pilgrims, until the heats of summer suspended their frequency, being, according to Matthew Villani, no fewer than 1,000,000! term of interval was still further abridged by Urban VI., and again by Paul II., who, in 1470, ordered that thenceforward each twenty-fifth year should be held as jubilee-an arrangement which has continued ever since to regulate the ordinary jubilee. Paul II. extended still more, in another way, the spiritual advantages of the jubilee, by dispensing with the personal pilgrimage to Rome, and granting the indulgence to all who should visit any church in their own country designated for the purpose, and should, if their means permitted, contribute a sum towards the expenses of the Holy Wars. The substitution by Leo X. of the fund for building St Peter's Church for that of the Holy War, and the abusive and scandalous proceedings of many of those appointed to scandardous proceedings on many or mose appliance to preach the Indulgence (g. v.), were among the proxi-mate causes of the Reformation. In later jubilec-years, the pligrimages to Rome gradually dimin-ished in frequency, the indulgence being, for the most part, obtained by the performance of the prescribed works at home; but the observance itself has been punctually maintained at each recurring period, with the single exception of the year 1800, in which, owing to the vacancy of the holy see, and the troubles of the times, it was not held.

The extraordinary jubilee is ordered by the pope out of the regular period, either on his accession, or on some occasion of public calamity, or in some critical condition of the fortunes of the church; one of the conditions for obtaining the indulgence in such cases being the recitation of certain stated prayers for the particular necessity in which the jubilee originated.

JUDÆ'A. See PALESTINE.

JUDAH (Heb. Yehuda, 'the Bepraised One') was the fourth son of Jacob and Leah, and founder of the greatest and most numerous of the twelve tribes. In the march through the wilderness, it had the post of honour-the van-assigned to it; and tradition narrates that its standard was a lion's whelp, with the words: 'Arise, O Lord, and let thine enemies be scattered!' After the conquest of Canaan, its territories stretched from the Dead Sea on the east to the Mediterranean on the west (though the Philistines long held possession of the fertile district west of the mountains of Judah), and from Jerusalem (excluding that city) on the north to the land of the Amalekites on the south. The capital of the tribe was Hebron.

JUDAI'ZERS, See EBIONITES.

JUDAS TREE (Cercis), a genus of trees of the natural order Leguminose, sub-order Casalpinica. The European J. T. (C. Siliquastrum) is a native of the south of Europe, and of the warmer temperate parts of Asia. It has almost orbicular, very obtuse confirmation, the sentences of all courts-martial, leaves. The flowers, which are rose-coloured, appear with the evidence adduced, are submitted to him; before the leaves. There is a legend that Judas and it is for him to represent to the commander hanged himself on a tree of this kind. The in-chief any illegality of procedure, or other cirnangen niment out a dree of this kind. In the limit and the line with the procedure, or other cir-American J. T. (C. Canadres) is very similar, but cumstances redering it undesirable that the Queen has acuminate leaves. The flower-beds of the should be advised to continue the court's decision former are frequently pickled in vinegar. The wood [The judge-advocate-general receives a salary of

of both species is very beautiful, vemed with black, and takes an excellent polish.

JUDE, EPISTLE OF, one of the smallest and least important hooks in the canon of the New Testament, was placed among the Antilegomena (Doubtful Writings) by the primitive church, while some even considered it spurious. It was not made use of by the Asiatic churches until the 4th c., and does not appear to have been known in the West until towards the end of the 2d. Even those who quote it do so with hesitation, such as Clemens Alexandrinus, Origen, and Jerome. At the Reformation, similar suspicions revived, and were entertained first by Luther and Calvin, and afterwards by the Magdeburg Centuriators and Grotius. In modern times, the tide of critical opinion has run strongly against its canonicity.

JUDGE is the generic descriptive name given to those who are invested with the power of judging and deciding causes in the highest courts of common law. In Great Britain—though it is otherwise in America—it is not usual to designate the highest America—it is not usual to designate the inguest class of judges by the epithet of judge, and British lawyers never do so. Thus, instead of saying Judge Blackstone, Judge Pollock, Judge Eldon, the proper description is—Mr Justice Blackstone, Chief Baron Pollock, Lord Chancellor Eldon, &c., according to the particular court in which they presided. In Scotland, the usual prefix to the name of a judge is Lord; and the judges there, on their appointment, often assume new titles in addition to the prefix 'Lord.' In England, the judges of the superior courts are only called lords while they sit in court, courts are only called forces while they sit in our, and are so addressed by counsel, but not elsewhere. The practice has long been for the crown to confer the honour of knighthood on all the judges of the superior courts of law and equity in England, but not in Ireland or Scotland. All the superior judges are appointed by the crown, and since 12 and 13 Will. III. c. 2, have held their offices during good behaviour; since 1 Geo. III. c. 23, they have also continued to hold their appointments notwithstanding the demise of the crown. They can only be removed from their office on the address of both removed from their onice on the address of hold Houses of Parliament. They are all, except the Master of the Rolls, disqualified from sitting in the House of Commons. Judges have no privileges notes of Commons. Judges have no privileges over other persons in respect of their obeying the law, except that the common-law judges in England have the privilege of suing and being sued in their own court, though not of judging in their own

The term judge has also been appropriated as the proper descriptive title of the judges of the county courts established in England in 1846.— Judge courts established in Lagrand in Ion. - Deage Ordinary, in English law, is the descriptive title of one judge only—viz., the judge of the Divorce and Probate Court. In Scotland, the phrase is often apphed to all judges, superior and inferior, when-ever they have a fixed and determinate jurisdiction, in contradistinction to commissioners, who have an occasional and temporary judicial authority delegated to them.

JUDGE-ADVOCATE-GENERAL, the supreme judge, under the Mutiny Act and Articles of War, of the proceedings of courts-martial. This officer is also the adviser, in legal matters, of the Commanderin-Chief and Secretary of State for War. Before latter. As it is essential that the judge-advocategeneral should have an intimate acquaintance with the military law, as well as with the general law of the land, he is provided with an assistant or deputy, whose office is permanent, and who is selected from among barristers of eminence.

The Deputy-Judge-Advocate is an other holding a temporary commission as public prosecutor in every court-martial. He must be an officer of intelligence, as it is part of his duty to examine and cross-examine witnesses, to warn the members of the court of any illegality in their proceedings, and generally to fulfil, in the limited area of the court, the functions which belong to the judge-advocategeneral in regard to the whole army.

JUDGES, BOOK OF (Heb. Shoftim), a canonical book of the Old Testament, recording the achievements of those heroes who, at different periods in the early history of the Hebrews, before the consolidation of the government under a monarchy, from Joshua to Samuel, arose to deliver their countrymen from the oppressions of neighbouring nations, but only three of whom, Deborah, Eli, and Samuel, were Judges in our sense of the word. The contents of the book have given rise to much criticism. It cannot be said to be a history, properly speaking. The events recorded in it do not follow each other chronologically, nor is there any other order to be perceived in their arrangement. It is rather a collection of detached historical traditions from the time of the Hebrew republic -probably redacted in the commencement of the reign of David-from ancient poems and popular saras. It exhibits (whether with a royalistic tendency, as has been supposed by some, or in order to point the moral that however deeply sunk a people—emphatically the people—might be in slavery or idolatry, or both, God would always send them a deliverer from either at the right time) the lawless and ungodly state of Israel during the greater part of this period, and the evil consequences their intimate connection with the idolatrous nations around them brought upon them. The book naturally falls into two portions - the first, up to chapter xvi., containing the heroic deeds of the single 'judges;' the second, from chapter xvii., the two accounts of the idol of Micah, and of the crime of Benjamin. The space of time over which the book extends has of old been hotly contested: that it comprises no less than 300 years (cf. xi. 26) is, however, almost the only point on which we can feel certain, since there is no doubt that many of the events recorded in the book did not follow upon one another, but fell in the same period: a circum-stance which chronologers generally have failed to take into account. The book itself differs considerably from the other historical books of the Bible by its simplicity and originality. That most of the heroic adventures related contain-sometimes, perhaps, under a highly poetical guise—true historical facts, has been doubted by but a very small number of critics. Ancient traditions make Samuel the author, or rather redactor of the book, and there is certainly little to be said against, and much for, this supposition. Compare Ewald, Wette, Rosenmüller, Studer, Keil, &c. See Jews.

JUDGE'S CHAMBERS means the place where a single common-law judge sits near Chancery Lane, London, in an informal manner, to hear attorneys make applications of an unimportant nature arising out of actions pending in court. If the judge refuse,

£2000 and is a member of the House of Commons chambers all the year round to dispose of these apand of the ministry changing, of course, with the plications, which are chiefly matters of form, but of nrgency.

JUDGMENT is, in English Law, the term usually applied to the final determination of a commonlaw court in an action, and when the litigation is at an end. In the courts of equity, the more usual corresponding term is a decree or order, and in criminal and Admiralty courts, a sentence. judgments of the superior courts are, as a general rule, capable of being appealed against (see APPEAL). When a judgment is not appealed against within a certain time allowed for the purpose, then it is final, and binding on the parties. If the judgment is registered, it will have the effect of preventing the judgment debtor from selling or alienating his lands, but in general has no such effect on his goods and chattels or personal estate, except money invested in government stock. In order to make a judgment effectual in an action of debt, if the debtor refuses to pay, a further process is necessary on the part of the creditor, called Execution (q. v.). In Scotland, judgment is usually called a Decree (q. v.), and judgment by default is called a decree in absence.

JUDGMENT. This familiar word of every-day discourse has a technical meaning in Logic, to which corresponds its acceptation as the name of a faculty of the mind. A 'judgment,' in logic, is an affirmation of some kind or other, as 'snow is white,' 'man is mortal.' The contrast to it is a mere notion, as white, mountain, mortality. In a judgment, two notions must always enter, but this is not the whole; there must be some declaration coupling the two together, a function performed in all cases by a verb. A complete meaning, as expressed in a grammatical sentence, is a judgment. Other designations for the same thing are—proposition, assertion, predication.

The intellectual faculty called Judgment has reference to the logical force of the word, and means the power of forming judgments, and by implication, the forther power of determining them to be true or false. This last function is perhaps what is most prominently implied in the faculty, as commonly understood

The intellectual power of judging, when probed to its deepest foundations in the mind, resolves itself into one of two things—the discrimination of difference, or the perception of agreement in the midst of difference (see Intellect). A judge in a court of law finds that a case comes under, or does not come under, a certain statute; which finding constitutes his decision. A scientific man decides a theory to be true by a certain extent of coincidence with observed fact. An artist approves or disapproves a work of art by its agreeing or disagreeing with his standard, or those previous productions that have settled his conception of excellence in that anecies.

JUDGMENT (in Theology). The doctrine of a judgment after death has always been associated with the belief in man's immortality, and is maintained as a doctrine of natural religion on the ground of that responsibility of which conscience always more or less distinctly testifies, and of the evident absence of a due proportion of rewards and punishments to human actions in this life. This doctrine, however, as a doctrine of the Christian religion, contains many things of which there is no evidence apart from revelation. Thus, we are told of a day or time of judgment, when, in great solemnity, and in presence of an assembled universe, the judgment shall be pronounced; also, that the Lord Jesus Christ is to appear in glory as judge. As a doctrine or decide wrongly, there is an appeal to the court Christ is to appear in glory as judge. As a doctrine of which he is a judge. In general, a judge sits at of revelation, the doctrine of a final judgment is also brought into close connection with that of the Resurrection (q. v.) of the dead.

JUDI'CIAL COMMITTEE OF THE PRIVY-COUNCIL, those members of the privy-council who sit as a court of justice in the hearing of appeals, &c. See Privy-Council.

JUDICIAL DECLARATION, in Scotch Law, means a declaration made by one of the parties to a suit, and who has been specially ordered by the court to be examined on a particular point. It is not a statement made on oath. In England, the phrase is seldom used, though the same result is obtained by what are called admissions of the parties.

JUDICIAL FACTOR, in Scotch Law, is a person appointed by the Court of Session, on special application, as a guardian to protect the interests of minors, absent parties, and lunatics. In England and Ireland, the corresponding officers are called receivers or trustees, according to circumstances,

JUDICIAL RATIFICATION, in Scotch Law, means the declaration made by a married woman in the absence of her husband, before a justice of the peace, to the effect that a disposition or deed of alienation of her heritable property has been made without coercion or fear on the part of her husband, and voluntarily on her part. A notary and two witnesses must also be present, and the former indorses on the deed a memorandum of the ratifi-The object is to remove objections which cation. might otherwise be made to the validity of the deed. In England, a corresponding process is called an acknowledgment of a deed by a married woman.

JUDICIAL REMIT, in Scotch Law, is a reference by a court or judge of a cause, or part of a cause, to the decision of an arbiter or nominee, such as an engineer or accountant. The matter referred is generally some technical matter in which the referee is specially skilled. In England, the corresponding phrase is a reference to an arbitrator or

expert to report.

JUDICIAL SEPARATION, in English Law, is the separation of two married persons by order of the Court of Divorce. Married persons may, if they please, mutually agree to live separate, and they may enter into a deed of separation for that purpose, which to some extent is recognised as purpose, which to some extent is recognised as valid by courts of equity. This is called voluntary separation. But, in the eye of the law, two married persons living apart are still married, and retain the status of married persons, and must sue and be sued in all respects the same as if they were still collabiting. And a deed of separation is always revocable by the parties, though to some extent binding on each, if the other do not consent to renew the cohabitation. But when the parties have not mutually consented to separate, one of them can compel a judicial separation for certain them can compet a judicial separation for certain grounds of misconduct. Thus, either party may apply on the ground of adultery, or cruelty, or desertion without cause for two years and upwards. The kind of cruelty which has been held a ground of judicial separation is difficult of definition.

The consequences of a judicial separation are as

follow. The parties, not being divorced, cannot marry again; but there is no longer the duty of cohabiting. Part of the decree may consist of an award of a certain income to the wife after separ-

maintaining his wife, except so far as he may have been ordered to pay her alimony, and he is not liable for her future debts. These last consequences have been declared in England since 1857, when the law was materially improved on the subject, and a new Divorce Court established.

In Scotland, the law has also been recently changed, and now nearly coincides with the English law in many respects, this improvement being made by the Conjugal Rights' Act, 24 and 25 Vict. c. 86. By that act, whenever a decree of separation a mensa et thoro is obtained at the instance of the wife, all property which she may acquire, or which may devolve upon her, is held entirely separate from and independent of her husband; she can bequeath it by will as if he was dead. She can also enter into contracts, and sue and be sued in her own name, and the husband is no longer liable for necessaries or her debts, except so far as he is bound by the decree of separation to pay to her aliment.

As regards the grounds of judicial separation in

Scotland, they are nearly the same, being described by Mr Bell in his Principles thus: whenever life is endangered, or there is fair and reasonable ground of apprehension of personal violence, or there is continued annoyance, wearing out and exhausting the party, or there are adulterous practices. It will, however, be found that the grounds of divorce are more ample in Scotland than in England. See MARRIAGE.

JU'DITH, the heroine of an apocryphal and Ewald, &c.) called by her name, is represented as a beautiful Jewess of Bethulia, who perils her life and chastity in the tent of Holofernes, general of Nebuchadnezzar, in order to save her native town. by the assassination of the Assyrian commander. This she achieves, and escapes with the head of Holofernes to Bethulia. Her townsmen are inspired with a sudden enthusiasm, rush out upon the enemy, and completely defeat them. The tale is enemy, and compressly dereat them. The tale is not mentioned by Josephus; and has, from an early period, been held to be an allegory; but it seems more probable that it is a legend founded on some real fact. It has frequently furnished poets and painters with subjects.

JUGGERNAUT. See JAGGERNAUT.

JUGGLERS (Fr. jongleurs), a term now almost synonymous with conjurer, and applied to persons who perform tricks of legerdemain, originally designated the professional musicians who attended the troubadours and trouvères of Provence and the north of France, either singing their poems, or, if they sung them themselves, accompanying them with an instrument, which was reckoned beneath the dignity of the poet himself. The word is derived from the medieval Latin joculator; in Provencal, joglar, joglador; in old French, jonglere or jongler; in modern French, jonglere or jonglero; in modern French, jonglere. These musicians soon began to be also kept in the service of kings and princes, whence they received the name of menestrels or minstrels (Lat. minister, a servant). The profession was at this time an honourable one, and good endowments were devoted to the maintenance of minstrels; and when the art of the minstrel ceased to be exclusively employed for the entertainment of courts, those of this profession formed a separate guild in some towns, as in Paris. But it gradually lost respectability. Rope-dancers, and all who aftion, and the court may true orders as to the constant of the court may be orders as to the constant of the court may be ordered by the man and the court maintenance of children. But, tree feets of selfity, were designated by the name spective of this, the wife becomes, to all intents jongleur, until it becomes restricted to its present and purposes as regards her future property, in the acceptation.—The ancient Romans had their consame position as if alse were unmarried. On the jurges or wonder-workers (praestipiotores), their other hand, the husband is no longer responsible for its rowers of knives (centilatores), and their players

with balls and rines (pilarii). proficients in everything of this kind are and have for many ages been the Hindus and Chinese.

JUGLANS AND JUGLANDACE.E. See WALNUT.

JUGU'RTHA, king of Numidia, son of Mastanabal, who was a natural son of Masinissa, was carethe sons of his uncle Micipsa, who succeeded Masinissa on the throne. After Micipsa's death, J. soon caused Hiempsal to be murdered (118 B. C.). soon caused Hiempsat to be murdered (118 R.C.), and Adherbal fled to Rome. J. succeeded in bribing great part of the Roman senate, and obtained a decision in his favour, freeing him from the charge of the murder of Hiempsal, and assigning him a larger share of the kingdom than was given to Adherbal (117 B, C.). But J. soon invaded Adherbal's dominions; and notwithstanding injunctions by the Romans to the contrary, besieged him in the town of Cirta (112 p. c.), and caused him and the Romans who were captured with him to be put to death with horrible tortures. Herenpon, war was declared against J. by the Roman people; but, by bribing the generals, J. contrived for years to baffle the Roman power. At last the consul, Q. Cacilius Metellus, proving inaccessible to bribes, defeated him in 109 and 108 E.C., so that he was compelled to flee to the Mauritanian king, Bocchus. Marius, who succeeded Metellus in the command, carried on the war against J. and Bocchus, till at last Bocchus delivered up J. to the Romans, who exhibited him at Rome in the triumph of Marius (104 n. c.), and then threw him into prison to die of J. has obtained greater prominence in hunger. history than he deserves, on account of Sallust's having written the history of the Roman campaigns against him.

JU'JUBE (Zizuphus), a genus of spiny and decidoous shrubs and small trees of the natural order Rhamnacca. The species are pretty numerous. The COMMON J. (Z. vulgaris) of the south of Europe, Syria, &c., is a low tree, which produces a fruit resembling an olive in shape and size, red, or some-times yellow when ripe. The fruit is dried as a sweetment, and forms an article of commerce. Syrup of Jujubes is used in coughs, fevers, &c.; hut tho J. paste, or Pare de J., of the shops of Britain is made of gum-arabic and sugar, without any of the dried jelly of this fruit.—The J. of India (Z. Jujuba) is a similar small tree, with round or oblong fruit, sometimes of the size of a hen's egg.-A Chinese species of J. (Z. nitida), has a very pleasant yellow fruit about an inch long; and other species not much inferior are found in Africa, South America, and other warm countries.—The Lotts (Z. Lotus), a shrub two or three feet high, a native of Persia, the north of Africa, &c., produces in great abundance a fruit about as large as a sloe, and with a large stone, but having a sweet farinaceous pulp, which the natives of some parts of Africa make into cakes resembling gingerbread. A kind of wine is some-times made from it.—Z. Spina Christi, another native of the countries near the Mediterranean, is sometimes said to be the plant from the branches of which our Saviour's crown of thorns was made, and is therefore called CHRIST'S THORN and JEWS' THORN, names which, for the same reason, are also given to Paliurus aculeatus. The fruit is about the size of a sloe, oblong, and pleasantly acidulous.

JU'LIAN, surnamed the Apostate, on account of his renunciation of Christianity, Roman emperor 361 . 363 A. D., was born at Constantinople 17th November 331, and was the son of Julius Constantius, the brother of Constantine the Great. His proper name JULIAN CROSS, or CROSS O was Flavius Claudius Julianas. He and his brother a cross crosslet placed saltire-ways.

But the greatest Gallus, who were too young to be dangerous, were spared when Constantius II., son of Constantine, massacred the rest of the imperial family. They were, however, removed to a castle in Cappadocia, where they were subjected to a system of rigorous espionage, J.'s life was very miserable, and the monkish education which he received produced no other result than a strong detestation of the religion professed by his tormentors. He was fond of litera-ture and speculation, and he instinctively turned away from the rude asceticism, gloomy picty, and barbarous janglings of Homoousians and Homoiousians, to the cheerfulness, refinement, and pure intellectual meditativeness of the old Greek philosophers. Some of his teachers appear to have been (secretly) pagans, for the sudden change in the state religion brought about by Constantine had necessitated a great deal of hypocrisy, especially among scholars and government officials. At the age of 20, J. was at heart a disbeliever in the divine origin of Christianity. On the death of his brother Gallus, he was removed by Constantius to Milan, but was subsequently allowed to go to Athens, the home of Greek learning, where he gave himself up to philosophical pursuits, and enjoyed that cultivated society which he so highly relished. The emperor—though still jealous and suspicious—now conferred on him the title of Casar, and scut him to Gaul to protect it from the incursions of the Germans. J. defeated the Alemanni at Strasburg (357 A.D.), and compelled the Franks to make peace. His internal administration in Gaul was mild and judicious. His popularity, in consequence, became very great, and when Constantius ordered him to set out for the East, J.'s soldiers rose in insurrection, and proclaimed their favourite emperor, who most reluctantly acceded to their demands. Constantius at Mopsocrene, in Cilicia, 3d November, 361 A.D., removed the only obstacle out of his way; and on the 11th of December he made a triumphal entrance into Constantinople. He now publicly avowed himself a pagan, but surprised both Christians and pagans by his edict of toleration. Yet he was not absolutely impartial, for he chose most of his officers from the professed followers of the old religion, and compelled the Christians to contribute to the restoration of the heathen temples. In 362 A.D., he made great preparations at Antioch, in the hope of bringing the war with the Persians to a successful termination; and in the following year advanced to Ctesiphon and across the Tigris, but want of provisions and treachery necessitated his retreat. He was followed and attacked by the enemy, who were repeatedly repulsed, but in one of the engagements he was mortally wounded by an arrow, and died 26th June 363. J. was both a great monarch and a great man. His rule, compared with that of many of the so-called Christian emperors, was just, liberal, and humane; and though only 32 years of age when he perished, he had composed a great number of orations, letters, satires, and even poems (collected and published by Span-heim in 1696). Among his lost works are his Among his lost works are his Refutation of the Christian Religion, and Memoirs of his German Campaigns, and his Diary. The cause of J.'s opposition to Christianity has been already indicated. We may say further, in elucidation of this important point, that J. appears to have been more attached to philosophy than religion, and that he more readily apprehended as truth what commended itself to the intellect, than what spoke to the beart.

JULIAN CALENDAR. See CALENDAR. JULIAN CROSS, or CROSS OF ST JULIAN,

747

JULIAN EPOCH. See CHRONOLOGY. JULIAN YEAR. See YEAR.

JULIEN, STANISLAS-AIGNAN, the first Chinese scholar in Europe, was born at Orleans, in France, 21st September, 1799, and in 1823 became a pupil of Abel Rémusat, who had recently been appointed to deliver a course of lectures on Chinese. In less than a year, he had made himself master of the principal difficulties of the language, and actually executed (in Latin) a translation of the great Chinese philosopher, Mencius, which was published at the expense of the Asiatic Society of Paris (2 vols. 1824), and pronounced to be faultless. From this time. his labours have been chiefly directed to the languages and literature of the far East. Ancient and modern Chinese, Mantchu, Sanscrit, the Mongolian tongues, are familiar to him; although, at the same time, he is said to know almost the whole body of European languages. His translations (into French) European languages. Als translations into recent membrace the most important works in all departments of Chinese literature. He has given specimens of the Chinese drama in his Hoci-lan-k (The Circle of Chalk, 1832) and his Tchao-chi-koueul (The Chinese Orphan, 1834); of Chinese romances, by his White and Blue, or the two Snake Fairies (1834), and several other pieces which appeared in Salmi-gondis and the Constitutionnel. J. is also the first who has succeeded in translating Chinese poetry well -the constant use of allegory, and allusion to facts not known to Europeans, rendering it nearly unintelligible. But more valuable still than those purely literary productions, are his translations of the great works that enable us to understand the religion and philosophy of the Chinese, such as the Book of Rewards and Punishments (1835), in which are contained the doctrines of Tao-sse, the Book of the Way and of Virtue (1841) by Lao-tseu, written in the 6th c. B. C., and forming the oldest and most illustrious monument of Chincse philosophy; and above all, the history of the Life and Travels of Hiouen-Tsang (1852), a work of immense importance for the earlier history and geography of India, and the knowledge of Buddhism. But not content with these brilliant labours, J. has sought to instruct us concerning the industry and arts of the Chinese, in a variety of treatises, of which we may mention his Summary of the Principal Chinese Treatises upon the Culture of Mulberry Trees and Silk-worms (1837), and his Treatise on the art of Manufacturing Porcelain (1856). He is also reported to have the materials prepared for a great Chinese dictionary. On the death of Rémusat, he became his successor at the Collège de France, and in 1855 president of the college. He is also conservator of the Bibliothèque Impériale, and is specially charged with the oversight of the Chinese

of the papal provinces on the Adriatic, J. not only entered into the league of Cambray with the emperor Maximilian and Louis XIL of France, but had recourse to spiritual arms, by placing the republic under the ban of the church; and on the submission under the han of the church; and on the submission of Venice, apprehending the ambitious designs of Louis, he withdrew from the league, and entered into an opposite alliance, the 'Holy League,' to which Spain, England, and Switzerland were parties. which spain, England, and Switzeriand were parases. Hence arose his bitter quarrel with Louis XII., in which the latter attempted, but ineffectually, to enlist the sympathics of the church against the pope. The Council of Pisa, which was convened under Louis's influence, was an utter failure: and the opposing council, fifth of the Lateran, assembled by J., but not brought to a close during his lifetime, completely frustrated the designs of Louis. It is alleged that, in his hatred of France, J. was desirous of drawing even the Turks into the league; but this allegation is negatived by his entire career, one of the main features of which was a design for a holy war, in which he himself should take the command. As an ecclesiastical ruler, J. has little to recommend As an eccessistical ruler, of has note to recommend him in the eyes of churchmen. As a political sove-reign, he is described by Ranke as a noble soul, full of lofty plans for the glory and weal of Italy; and Professor Leo considers him, with all his defects, as one of the noblest characters of that age in Italy. He was a liberal and judicious patron of art, and a friend of the rising literature of the time. He died February 22, 1513.-J. III., a native of Monte San Savino, near Arezzo, was known before his elevation to the pontificate as Cardinal del Monte. He was one of the four legates of the pope under whom the Council of Trent was opened; and after his election to the papacy in 1550, he himself re-opened (in 1551) that council, which had been suspended for upwards of two years. He is connected with English history as having sent Cardinal Pole to organise with Mary the reunion of the kingdom with Rome; but his general government of the church is marked by no very striking events, and his private character is sullied by the taint of nepotism. He died March 23, 1555,

JULLUNDER, a city of the Punjab, stands in the Doab of the same name between the Sutlej and the Beas, in lat. 31° 21′ N., and long, 75° 31′ E. Having once been the capital of the Lodi-Afghams, it is surrounded by a vast number of large and magnificent mansoleums. The soil of the neighbourhood is remarkably productive; and the place, faller, as it is, from its former greatness, still contains 40,000 inhabitants.

JULUS, or IULUS, a genus of Myriapoda (q. v.), of the order Chilognatha. The whole of this order

Julus Terrestris.

and military enterprises for the complete re-establishment of the papal sovereignty in its ancient territion of the papal sovereignty in its ancient territory—Bologna, Ferrara, &c., and for the extinction genus J., as now restricted, contains many species, of foeign domination and foreign influence in Italy, several of which are American and some British, In pursuing his designs, for the purpose of compelling from the reputhio of Venice the restitution. The largest is the Spirobolus marginatus of Say, polling from the reputhio of Venice the restitution [1]. more numerous—some having 120 pair—and are so weak that the animal seems to glide along on its belly, the feet moving like a wavy fringe on each side. The body is nearly cylindrical, not flattened to any alarm, the animal rolls itself up in a coil. The Joll have not the jaws perforated as a poison duct, like centripeles. They limbit moist and dark places, and feed chiefly on decaying vegetable substances, sometimes also on decaying vegetable substances, sometimes also on decaying naimal substances.

JULY, the seventh month of the year in our calendar, fifth in the Roman calcular, where it was called Quintilis (the fifth). Originally, it contained 36 days, but was reduced by Romulus to 31, by Numa to 30, but was restored to 31 days by Julius Cesar, in honour of whom it was named July (Lat. Julius), on account of his birth having happened on the 12th of this month. It was called Jules-month, or mead-month, and lithus-arghera, or after-mild-month, by the Angle-Saxons (and the second processes of the sec

JUBBUSER, a town of British India, presidency of Bengal, is situated in the district of Bharuch, and 26 miles north-west of the town of that name. Pop. 16,000, who are principally employed in the cotton, grain, and coarse cloth

JUMI'LLA, a handsome town of Spain, in the modern province of Murcia, is situated in a delightful valley 35 miles north of the city of that name. Pop. 7400, who manufacture firearms, earthenware, and tiles.

JU'MNA, the principal feeder of the Gauges, is perhaps the only Indian river of the first class which has its course wholly in Hindustan-the Indus, Sutlej, Gauges, and Brahmaputra all rising in Tibet. Its source, at a height of 10,849 feet above the sea, is in lat. 31° N., and long. 78° 32' E., at the south-west base of the Jumnotri Peaks: and, after flowing 680 miles chiefly in a south-east direction, it joins the Ganges at Allahabad. After its first 100 miles, during which it receives many affluents, of which the Touse is the largest, it enters the plain of Hindustan in lat. 30 20 N., and long. 77 38 E., having still an altitude of 1276 feet above the sea. Below this point, it is joined by many considerable streams: the Chumbul, the Sind. the Betwa, and the Cane on the right; and the Hindon, the Seengoor, and the Rind on the left. All the way downwards, the J. is generally shallow, and, excepting as to descending rafts, unfit for navigation. By artificial means, however, its waters have been rendered doubly available both for commerce and for agriculture. From either bank, a canal has been drawn at once for the use of inland craft and for the purposes of irrigation. The one on the right side, begun in 1356, leaves the main channel a short distance below the point of its emerging from the mountains; while the one on the left side, commenced in 1824, takes its departure a little further down, near the village of Fyzabad. Both of them rejoin the parent stream at Delhi. Historically and politically, the J. occupies a more prominent position than the Gauges itself above their junction. The former was necessarily the first to cross the path of every invader from the north-west; and hence on it were built both Agra and Delhi, the two capitals of the Mussulman con-

JUMNO'THI, hot springs near the source of the Jumna, in lat, 30° 59′ N., and loug, 78° 35′ E., 10.849 feet above the sea. Their temperature is 104° 7 E., nearly that of boiling water at their elevation. They are overhung by three connected mountains known as the Jumnotri Peaks, whose altitudes respectively are 21,155, 20,916, and 20,122 feet. JUNCE-E, or JUNCA-CE-E, a natural order of endogenous plants, herbaccous, generally perennial, with creeping root-stock; narrow, often fistular leaves; regular flowers; the periant 6-partite; the leaves; regular flowers; the periant 6-partite; the stamens sax; the fruit a 3-valved capsule. This order is nearly alied to Liliacce, notivitistanding very great difference of aspect for rushes (Junce) are the best known examples of it. The species, about 200 in number, are mostly natives of cold and temperate climates.

JUNE, the sixth month of the year in our calendar, but the fourth among the Romans. It consisted originally of 26 days, to which four were added by Romulus, one taken away by Nuna, and the month again lengthened to 30 days by Julius Cesar, since whose time no variation has taken place. The Angle-Saxone called this month sear-month, or dr-month, and molesurer-mounth and molesurer-mounth and molesurer-mounth.

JUNG, JOHANN HEINRICH, generally called JUNG STILLING, an author, the events of whose life and whose gifts of imagination render him worthy of notice, although at one time his merits were greatly over-estimated. He was born of poor parents at Imgrund, in Nassau, 12th December 1740, and after trying various occupations, became a student of medicine at Strasburg, where he lived in intimacy with Goethe, who conceived a great liking for him, on account of his simple, pure, affectionate nature, settled as a medical practitioner at Elberfeld, and distinguished himself as an operator for cataract: He is said to have improved the eyesight of more than 2000 persons. J. subsequently held professor-ships at Marburg and Heidelberg. He died at Carlsruhe, 2d April 1817. His first publication was an autolography, II. Stilling's Jugend, Jünglingsjahre, Wanderschaft, Lehrjahre, Häusliches Leben und Alter (3 vols. Berlin, 1777-1778), which attracted much attention, and was followed by other publications from time to time, continuing the history of the author's career. In religion, J. represents a class by no means uncommon in Germany-viz., the piclistic rationalists, men who put little stress upon the (written) word of God, but are full of veneration (often degenerating, however, into a mere sentimental enthusiasm) for the spiritual truths of Christianity. J.'s collected works were published (1838) at Stuttgart in 14 vols.

JUNGERMA'NNIA, a Linnean genus of cryptogamous plants, containing a great number of species, which some modern botanists have divided into many genera, and some have even formed into an order, Jungermannineae, although it is more generally regarded as constituting a sub-order of Hepatics (q. v.). The distinctive characters of the sub-order are that the spore-causes open by four valves, and that the spores are mixed with cluters. The species much resemble mosses in appearance. Many are natives of Britain, some of them very common in moist places. The tropical species are very numerous, and some of them are to be found even on the young shoots and leaves of plants.

JUNGFRAU (the Maiden), one of the highest mountains of the Bernese Alps, rises on the boundaryline between the cantons of Bern and Valais, and attains a height of 13,720 feet. It received its name either from the unsulfied purity and dazzling brightness of the snow by which it is covered, or a prightness of the snow by which it is covered, or ever reached its highest point. In 1828, its aumain was attained by aix peasurs from Grindelwald; and in 1841, by Prof. Agassiz and Prof. Edward Forkes, accompanied by others.

JUNGLE-FOWL, the name given by the Australian colonists to a bird (Megapodius tunulus), which has also been called the MEGAPODE, totally

9

Only in

-present also in the

wood, particularly in

the young wood. wood is yellowish red,

circum-

different from the jungle-fowl of India. See Fowl. It belongs to the family Megapodida, All the It belongs to the family Megapoutide. All the species are large birds, with short wings and tail, and of slow, heavy flight. They are remarkable for the thickness of their legs (tarsi), and their long and thick toes; and for their habit of heaping up mounds of earth, decayed leaves, &c., in which they lay their eggs, which are hatched by the heat pro-duced by fermentation. The Australian J. makes heans sometimes fifteen feet high, and sixty feet in circumference at the base, under the shade of thick trees or shrubs, where the heat of the sun may not evaporate the moisture. In these heaps, it makes holes of several feet in depth, in which to deposit its eggs. How the young birds emerge, is not yet known, nor if they are assisted by the parent birds, Rnown, nor it they are assisted by the parent burds. The mounds of the J. were at first supposed to be sepulchral tumuli. The J. is mostly of a brownish colour. Its size is rather less than that of the common domestic fowl. The propensity to heap up earth is very early manifested by young birds.

JU'NIPER (Juniperus), a genus of trees and sbrubs of the natural order Coniferæ, sub-order Survey of the male and flowers, the male and female generally on separate plants, and the fruit a fleshy golbule (popularly a berry), containing three small nuts. The species are all evergreen, and have small narrow, rigid leaves, which are opposite, or in whorls of three or four, or imbricated in four rows. They are natives chiefly of temperate and cold regions, and are found in

Europe, Asia, Africa, and America. - The Common J. (J. communis) is found in all parts of

Europe and the north of Asia, and in the northern parts of North America. favourable stances does it become a tree of 15, 20, or at most 30 feet in height, and in general it is only a shrub from 2 to 6 feet high. The fruit takes two years to ripen; it is round, of a bluish-black colour, with a whitish bloom; it is of the size of a small currant, and is produced in great abundance. The little nuts or stones of the fruit have on the shell three glands, which abound, especially before ripening, in an essential oil—Oil of J.

Common Juniper (J. communis): , branchlet with male flowers; b, part of branchlet with female flowers; c, unripe fruit.

brownish in the heart, hard, and fragrant. When of sufficient size, it is much valued by turners. It is also used for veneering. The dry twigs, roots, and berries are used for fumigation. The berries have a strong and peculiar They are much used for flavouring gin, which derives its name from them (see GIN). also enter into several medicinal preparations, being stimulant, sudorific, and diuretic.—The bark of J. may be made into ropes, and in some parts of the Highlands of Scotland, the roots are woven into the coarse baskets which are used for potatoes, peats, &c.—Oil of J. is lighter than water ; specific gravity,

0.839. It is limpid and nearly colourless. It is obtained by distilling the unripe fruit, or the twigs. with water. The medicinal properties of J. depend on it; six drops are a dose.—Spanish J. (J. oxycedrus) grows in arid situations in the countries around the Mediterranean Sea. Its fruit is about the size of a hazel-nut; and from its fruit and wood is procured an essential oil of disagreeable odour, called Huile de Cade (q. v.), which is used in veterinary practice, particularly as a cure for scab in sheep.

—VIRGINIAN J. (J. Virginiana), the RED CEDAR of North America, is an evergreen tree, often 30-50 feet high, of conical form, with horizontal branches and very small leaves; a native of North America, from Lake Champlain to the Gulf of Mexico. It grows in sandy or rocky places. It is often planted in pleasure-grounds in Europe, and succeeds well in Britain. The berries are small and bright blue. The heart-wood is of a beautiful red colour, and is valued by turners, coopers, &c. It is imported into England for making pencils. There are often found on the branches fungous excrescences called Cedar Apples, which have been recommended as a vermi-fuge.—The Bernudas Cedar (J. Bernudiana) is a native of the Bernudas, a lofty tree, with very fragrant reddish-brown wood, which is used for furniture, pencil-making, &c., and also for lining cabinets, its flavour preventing the attacks of moths and other insects.—The Himalaya Mountains produce several species of J., trees of considerable size, beautiful appearance, and valuable wood. The only species of J. which is a native of Britain is the Common J., and it is found chiefly in the more mountainous parts.—The Swedish J. of our shrubberies is merely a variety of the commou juniper.

JU'NIUS, LETTERS OF, a famous series of political letters signed 'Junius,' which appeared in a London newspaper, The Public Advertiser, during the last year of the administration of the Duke of Grafton and the first two years of that of Lord North. They were 44 in number; besides which, are to be reckoned as proceeding from the same pen 15 signed Philo-Junius, 62 business-letters (mostly very short) addressed to his publisher, Woodfall very short) accressed to his publisher, woodland, and 10 to Wilkes (privately); and in addition, 113 letters under various signatures. The first of the letters of J., published January 21, 1769, treats of the 'State of the Nation,' and may be said to strike the key-note of all the subsequent correspondence. In it, the author singles out several leading members In it, the author singles out several leading members of the ministry, and boldly denounces their ineffici-ency; and the last of the letters, dated January 21, 1772, closes somewhat suddenly the long indictment against ministers in the same spirit in which it had begun. No sooner did the first Junius appear, than the court-party took the alarm. An invisible and dreaded censor was evidently moving among them-one who, though as yet the days of parliamentary reports were still far off, seemed cognizant of all the proceedings of both Houses, who not only knew intimately the public career of ministers, but was fully informed regarding the follies and the crimes of their private character. Sir W. Draper, who entered into controversy with this unknown adversary, was in the end overmastered, and reduced to mere humble complaint and confession. The Duke of Bedford, Lord Mansfield, and chief of all, the Duke of Grafton, writhed beneath his lashthe last of these being more indebted for immortality to the splendid sarcasm of Junius than to any measure which it was his fortune to introduce. any measure winch it was his fortaine to introduce. It cannot, however, be denied that the hatreds of Junius, though springing for the most part from his detestation of injustice, and his contempt for incapacity, were increased and imbittered by party

spirit and personal dislike. The style of these letters, though perhaps occasionally somewhat stiff and formal, is of the very highest class. Occasionally rising to the loftiest eloquence, it is always remarkable for closeness of argument, felicity of illustration and allusion, and brilliant epigram. Whoever Junius was, his life depended upon his preserving his nom de plume. He had made too many enemies to be safe in acknowledging himself. From the day of the publication of his first letter, however, conjecture has been busy framing theories of the authorship. Burke, Lord Shelburn, Colonel Barré, Lord George Sackville, Wilkes, Horne Tooke, Thomas Lord Lyttelton, among others, were supposed in turn to be Junius; but the general opinion now is, that Sir Philip Francis (q. v.) was the author of these See Prinip Francis (g. v.) was the author of these letters. The Franciscan theory is supported by a weight of evidence, which, although entirely circumstantial, is sufficient, Macaulay thinks, 'to support a verdict in a civil, nay, in a criminal proceeding.' The handwriting of Junius is the handwriting of Francis slightly disguised. Junius as is evident from his letters, knew the forms of the Secretary of State's office, was intimately acquainted with the business of the War Office, attended the House of Commons in 1770, and took notes of speeches, especially of those of the Earl of Chatham; denounced the promotion of Mr Chamier in the War Office as unjust to Mr Francis, and was bound by some strong tie to the first Lord Holland. All these circumstances in the position and actions of Junius, the nuknown author of the letters, correspond exactly with the history of Francis, and do not sgree in more than two points with the history of any other public man of that period. 'If this argument,' says Macaulay, 'does not settle the question, there is an end of all reasoning on circumstantial evidence. See Allibone's Dict. of Authors, Art. Junius, and Lippincott's Magazine for January, 1870, p. 118.

JUNK, a Chinese vessel, often of large dimen-

sions. It has a high forecastle and poop, and ordinarily three masts. Junks, although elumsy vessels,

incapable of much seamanship or speed, have proved themselves seaworthy on voyages extending even to America and Europe. The junk of Japan is considerably superior to that in use in China.

Junk, in the British navy, is a familiar term for the salt ment supplied to vessels for long voyages the name being probably derived from the fact that it becomes as hard and tough as old rope, pieces of which are officially styled junk.

JUNKSEYLO'N, or SALA'NG, an island in the Bay of Bengal, lies in lat. 7°46 N., and long. 98°18', E., near the west coast of the peniusula of Malacca, It belongs to Siam, and trades chiefly with the British settlements of Malacca, Penang, and Singapere. It yields tim, eithle birds'-nests, and Japan

JUNO AND HERA, the Roman and Greek names of the queen of heaven, and wife of the supreme divinity. The two conceptions have unfortunately been confounded, and hence their essential dissimilarity has been lost sight of—a dissimilarity, it may be remarked, as great as that which existed between the Roman and Greek character. We shall sudeavour to distinguish between the two conceptions.

Hera (meaning 'mistress'), the Greek goddess, was the daughter of Kronos and Rhea. She was the sister of Zeus, and afterwards became his wife. Her jealousy is proverbial, and was unfortunately too well founded, for Zeus was the reverse of a faithful husband. In the Homeric poems, she appears, on the whole, as an obstinate, quarrelsome shrew, whose temper is a source of frequent discord between herself and her lord, whom, however, she greatly fears. She is represented as often spitefully favouring persons who were the objects of the dis-pleasure of Zeus, and has to be punished for her disagreeable ways. Zens scolds and even beats her; and on one occasion, we read of his having tied her hands, and hung her up in the clouds. But she is, nevertheless, a female of majestic beauty, the grandest of the Olympian dames. As the only wedded goddess in the Greek mythology, she naturally presided over marriage and at the birth of children. She rode in a chariot drawn by two horses; and in her famous temple at Mount Eubæa, her statue, made of gold and ivory, bore a crown, symbolic of her queenly dignity. Her favourite residences were Argos, Sparta, and Mycenæ; but she had sanctuaries in many parts of Greece. Greek artists loved to represent her as a majestic woman of middle age, possessing a maternal dignity of mien, with beautiful forchead, large eyes, and venerable expression. Homer repeatedly calls her 'the venerable ox-eyed Hera.'

Juno (the name is from the same root as Jupiter), the Roman goddess, was the queen of heaven, and, under the name of Regina, was worshipped in Italy at an early period. She bore the same relation to women that Jupiter did to men, Like the Greek Hera, she took a special interest in marriage, whence her name of Juga or Jugalis (the voke-maker); but she was also a kind of female Providence, protecting the sex from the eradle to the grave. Her epithets, Virginalis (the goddess 'of virgins') and Matrona ('of mothers'), indicate this. It is a very significant feature of the Roman character, that J. was also believed to be the guardian of the national finances, watching over her people like a thrifty mother and housewife. A temple, containing the mint, was erected to her on the Capitoline as J. Moneta (the money-coiner). She was besides the goddess of chastity, and prostitutes were ferbidden to touch her altars. She had a multitude of other surnames, which we cannot afford space to enumerate. Her great festival was

called the Matronalia, and was celebrated on the lst of March. Her month (June) was considered the most propitious for fruitful marriages; and even yet, after eighteen centuries of Christianity, this old Roman faith lingers superstitiously in the popular mind.

JUNOT, ANDOCHE, Duke of Abrantes, and Marshal of France, was born October 23, 1771, at Bussy-le-Grand, in Côte-d'Or, entered the army as a volunteer in 1792, and distinguished himself in the early wars of the Republic. In 1798, he followed Napoleon to Egypt, was there created general of brigade, and particularly distinguished himself at Nazareth, where, at the head of 300 cavalry, he put to flight 10,000 Turks, after a conflict of fourteen hours' duration. In 1807, he was appointed to the command of the army of Portugal. His army, after undergoing dreadful privations, reached Lisbon, and J., with the greatest expedition, made himself master of all the strong places in the kingdom, and reorganised his army. For his brilliant conduct at this time he was created Duke brilliant conduct at this time he was created Duke of Abrantes, and appointed governor of Portugal; but being defeated by Wellington at Virneira, he concluded a convention at Cintra, returned to France, and subsequently served in Germany, Spain, Portugal, and Russia. In 1812, he was disgraced by Napoleon for a supposed want of energy, and sent to govern Illyria. This, along with other causes, produced mental derangement. He was causes, produced mental derangement. He was taken to his father's house at Montbard, near Dijon, and two hours after his arrival, precipi-tated himself from a window (22d July 1813), and fractured his thigh-bone. Amputation was performed, but J. franticly tore off the bandages, and died some days afterwards.—His wife, LAURE PERRON, the celebrated Duchess of Abrantes, has gained a reputation in the literary world by her Mémoires ou Souvenirs historiques sur Napoléon, la Révolution, le Directoire, le Consulut, l'Empire et la Restauration (Paris, 1831-1835), and by several minor works.

JU'NTA, i.e., an association, the name given in Spain to a body of persons combined for any political or civil object. The term was formerly applied more exclusively to assemblies of representatives of the people meeting without authority of the sovereign, but has been extended to those of the most strictly legal character.

JUPATÍ PALM (Raphia tædigera), a palm which grows on rich alluvial tide-flooded lands near the mouth of the Amazon. The stem is seldom more than six or eight feet high; but the leaves are often 50 or 60 feet long, rise vertically from the summit of the stem, and bend out on every side in summin to the seem, and beau due to every sale in graceful curves forming a magnificent plume. The loaves are perhaps the largest in the vegetable kingdom; they are pinnate, the leaflets about four feet long. The leaf-stalks, which are often twelve or fifteen feet long below the first leaflets, and four or firee feet long below the first leaners, and nor of five inches in diameter, perfectly straight and cylindrical, are almost like birds' quills in strength and lightness, when dried, of a soft substance, with a thin, hard, glossy outer covering. They are used for various purposes, as for laths, window-blinds, &c. The interior part is soft enough to be used instead of orce. instead of cork.

JU'PITER, or JUPPITER, in Roman Mythology, was the greatest of the gods. The name is a modification of Diovis pater, or Diespiter (Diovis, or Diesedivum, heaven), i.e., the Father of Heaven or

hurler), and Serenator (the Weather-clearer). But he possessed still higher and diviner attributes. The possessed 6th inguer and diviner attributes. The future was spread out clearly before his all-seeing eye; the destinies of men were in his hands, and events were but the expression of his omnipotent will. But he was not careless of mankind. He revealed himself in a variety of ways to them, and revealed image in a variety of ways to them, and taught men to interpret these mystic and symbolic revelations. Wonderful appearances in the sky, or unwonted circumstances happening on the earth, were the media of his communications; hence his surname of Prodigialis (the Sender of Prodigies). As the national god of the Roman people, he went with them into battle (like the Jehovah of the Hebrews), fought for them, procured them victory, and, generally speaking, was their protector at home and abroad. This conception of J. is shewn in such names as Imperator (the Ruler), Victor (the Conqueror), Stator (the Stayer or Stander-by). The strong sense of morality which marked the old Romans also found its expression in their view of the character of the best and greatest (optimus muximus) character of the best and greatest (optimus mercunner) of their gods. J. was the guardian of law, justice, and virtue; oaths and all solemn engagements were made as to him ('in the sight of God,' as we say). He had temples erected to him at Rome under all his different names; but the principal one was that on the Capitol, whence he had the title of Capitolinus, and where, with beautiful significance, the statues of Fides (Faithfulness) and Victoria (Victory) were placed beside his own. When consuls or other magistrates entered on the duties of their office, or when the army was about to open a or a general returned victorious from campaign, war, sacrifices were solemnly offered to J. and his war, acrinces were solemnly oftered to J. and his favour invoked. When the Romans began to know the religion and literature of Greece, they foolishly sought to identify their own noble, majestic, and gravely upright J. with the slippery, lustful, and immoral Zews of the Greeks. Hence have originated much confusion and misconception. See ZEUS.

JUPITER. See PLANETS: SOLAR SYSTEM.

JUPITER SERA'PIS, TEMPLE OF. The ruins of this temple at Puzzuoli, near Naples, afford a remarkable instance of the changes which have taken and are taking place in the relative position of the land and water on the earth. Only three of the original forty-six pillars exist. They rise out of the water, the pavement of the temple being at of the water, the pavement of the empte orang as present submerged; but they bear evidence that they have been at one time submerged to half their height, which is 42 feet. The base of the pillars as high as twelve feet is quite smooth; for the next night as twelve tere is quite smooth; but the fext nine feet they are penetrated by a boring shell, which is still active in the neighbouring rocks. The water must have covered this portion of the pillars, and while the molluses were busy, the lower twelve feet must have been protected from their ravages by being buried in mud. The changes of level have been so gradual that the pillars have not been moved from their original position.

JUPON, or JUST-AU-CORPS, a surcoat. The name jupon is chiefly applied to the short tight form of that military garment in use in the 14th

JU'RA, a range of mountains, of a pecunar nun-stone formation, known as the Jura Limestone, stending from the angle formed by the Rhone and the Ain, in a morth-easterly direction (with a gradually declining elevation), for more than 450 miles, to the upper part of the course of the Maine. The Rhine, breaking through it between Schaffhausen and Basel, divides it into two parts. miles, to the upper part of the course of the Heaven by Father. As such, J. had all power Maine. The Rhine, breaking through its between over the phenomena of the skies; hence his numerSchaffhausen and Basel, divides it into two parts, our epithets, such as Plurius (the Rainegiver), the Swiss or French, and the German Juna. The Tournes (the Thunderer), Falminator (the Lightningl

Credez, Dòle (which commands a splendid view of Mont Hane), and Mont d'Or, all of which are between 5000 and 6000 fact in height. The Swiss Jura consists of a number of parallel claims with long deep valleys between, and over it roads have been carried with great difficulty; but the German Jura is more broken up by cross valleys. In both parts of the range are numerous caves, which abound in magnificent stallactites, and in the bones of extinct animals; whilst in the Swiss Jura, there are several instances of rivers of considerable size of extinct animals; whilst in the Swiss Jura, there are several instances of rivers of considerable size. The southern part of the range lies partly within the French department of Jura, to which it gives its name. Magnificent pine-forcets are here a characteristic feature of the scenery.

JURA, a frontier department in the east of France, is bounded on the S. by the department of Ain, and on the E. by Switzerland. Area, 1943 square miles, of which upwards of one-third is under square miles, of which upwards of one-turn is under cultivation, and upwards of one-fourth in wood. Pop. 298,477. Of its surface, two-thirds are covered by the Jura Mountains; the remainder is a low plain about seven miles wide, skirting the western border. Chief rivers-the Ain, the Doubs, and the Louc. The soil on the mountains is thin and stony, but yields abundant grass, upon which great numbers of horses and cattle are fed from June to October; on the plain, the soil is rich, and grain-crops are produced in great abundance and The wines of Arbois, of Poligny, of Etoile, and of Salins, have some reputation; 8.800,000 gallons of wine are produced annually. The mineral wealth of the department is considerable; the working of iron is one of the chief branches of manufacturing industry. Cheese is extensively made, and there is a good trade in timber. The department is divided into the four arrondissements. Lons-le-Saulnier, Poligny, Sainte-Claude, and Dôle.

JURA, one of the Inner Hebridea lying off the coast of the mainland of Argyle, and having the island of Islay on the south-west. It is 27 miles long, and about five miles in average breadth. A ridge of bleak and rugged mountains traverses the whole length of the island, and rises in the Paps of Jura, in the south, to an elevation of 2566 teet. The west coast is deeply indented by Loch Tarbert, which nearly divides the island in two. The western shores are savage and rugged; the castern are pleasing in appearance, presenting green alongs and belt of plain. At the northern extremity alongs and a both of plain Art the northern extremity continued in the castern are pleasing in appearance, presenting green cuttivation. Oats, barley, postatoes, and flax are produced; and black cattle are reared for export. Pop. (1801), 844.

JURA'SSIC GROUP, the name given by continental geologists to the Oolitic series, because the chain of the Jura Mountains, on the north-west of Switzerland, is composed of these rocks. See OOLITE.

JURISDICTION, in Law, means the authority which a court or judge has to entertain a particular case and decide it. The general rule is, that if a court, which has no jurashiction to decide a particular case, does decide it, the judgment is a mero anility. Many nice questions often arise on the question of jurisdiction, which are too intreact to jurisdiction. In England, it is generally called a plea to the jurisdiction. In Scotland, it is included among what are called preliminary pleas.

JURISPRU'DENCE is the science of law, which professes to discuss the principles on which legal rights should be protected and enforced; or it may be called the philosophy of law. This subject has been less cultivated in England than in continental countries, or even in Scotland; for, in England, the habits of the people and also of their lawyers are too practical to admit of spending time in discussing elementary principles which are more or less vague and speculative. In its literal sense, the term means merely knowledge of the law, and seems to have been so used in the Roman law, from which it has been borrowed. The word is often used in a popular sense in this country as synonymous with law, and it is also so used in France; but it is also and more correctly used in contradistinction to law, as implying the system or supposed methodical scheme embracing the principles on which posi-tive law is founded. A distinction is sometimes made between general jurisprudence, which investigates the principles common to various systems of positive law, divesting these of their local, partial, and other accidental peculiarities; and particular jurisprudence, which confines itself to the particular laws of England, or France, or Scotland, as an independent system taken by itself. Jurisprudence thus embraces a wide range, as treating of all those duties which are enforced between man and man; and yet it may be safely said, that lawyers, though dealing with the results of the science every day of their lives, seldom give any attention to the latent and general principles on which these results are founded. The only writers who have devoted their attention to this speculative side of the law in this country are Bentham, whose various works abound with these discussions, and Mr Austin, whose Prorince of Jurisprudence Determined is an acute and masterly work on first principles, to whom may be added John Stuart Mill and Mr H. S. Maine.

JURY TRIAL (Fr. juré, sworn), is a mode of trial in the United Kingdom, by which a few of trial in the United Kingdom, by which a few citizens, selected for the purpose, are constituted the judges of the truth of the facts in suits between parties, and compelled to discharge this duty on the sanctity of their oath, but in sub-ordination to a higher judge, who has distinct functions of control. Various theories have been adopted as to the origin and development of this characteristic feature of the administration of justice in the United Kingdom, Jury trial does justice in the United Kingdom. Jury trial does not owe its existence to any positive statute, but has grown up insensibly, and has become inex-tricably intervoven with the people's habits. It was generally supposed, until recently, that our Anglo-Saxon ancestors had the credit of having nursed the germ of this vigorous plant of liberty; and a cartoon in the new Houses of Parliament has embodied this popular belief. Recent researches have, however, shewn that jury trial, as now known and practised, did not exist in those times, though it has been the natural development and sequence of other rudimentary forms of trail then prevailing, Indeed, the gern of jury trial is found in human nature itself, and in some phase or other, is detected in almost every form of civilisation, the essence of it being a reference of disputed facts to the impartial judgment of a few men of average as the litigants. In ancient Rome, a criminal trial as the fitigants. In ancent femer a criminal row was conducted before a presiding judge and a body of judices, taken from a particular class, whose duty it was to determine the fact of the guilt or innocence of the accused; but they could exercise the prerogative of mercy, which does not belong to the modern jury. The result of the forms of trial usual with the Anglo-Saxons has been summed

up by Mr Forsyth in his History of Jury Trial, and he states these conclusions. Courts were presided over by a reeve, who had no voice in the decision and the number of persons who sat was usually twelve. The assertions of parties were admitted as conclusive, when supported by the oaths of a certain number of compurgators. The testimony of the neighbourhood was appealed to for the purpose of deciding matters of general concern. Swom writnesses were appointed in each district, whose duty it was to attest all bargains and transactions, in order that they might be ready to give evidence in ease of dispute. Every care was taken that all dealings between man and man should be as open and public as possible. It was by a gradual process of improvement and it would be included our limits to discuss the details of this progress. It will suffice to describe the institution of jury trial as it now exists, and has for centuries existed with little alteration.

In criminal cases in England and Irelaud, there are two or three kinds of juries in requisition. In all cases of sudden death, homicide, or murder, the coroner of the district summons a jury of twelve men, who inquire into the circumstances of the death, and if it appear that such death was caused by the criminal misconduct of any person, the jury may find that such person was guilty of murder. This inquisition, or finding, is sufficient, without any other process, to put the alleged criminal on his trial; but it is often considered expedient to proceed also against the prisoner in the ordinary manner. In all criminal cases, the grand jury is the medium of accusation. They perform the duty of public accusers; they do not try a prisoner, but all indictments are in the first instance submitted to their consideration, for the purpose of seeing whether there is enough of doubt and suspicion to make it necessary to put the accused on his trial. Accordingly, in every county and borough of England where sessions of the peace or assizes are held for criminal trials, a jury of not less than 12. nor more than 23 men, are summoned to see that there is some foundation for each indictment. The judge first charges them-that is, gives them general directions as to particular crimes, and they hear witnesses for the prosecution only and ex parte, finding a true bill, or ignoring the bill, according as they think there is or is not a case worthy of trial against the prisoner. See Grand Jury. The chief duty, however, as to the trying of prisoners is discharged by the petit jury, which consists of twelve men, who are sworn to try the cause between the crown, as prosecutor, and the prisoner. Previous to this trial, the prisoner is not, as a matter of course, entitled, except in cases of treason, to a copy of the indictment, though in many cases he cau indirectly obtain a copy, or at least is generally made acquainted with the particulars of the charge against him. Nor is the prisoner entitled, except in cases of treason, to have a list of the witnesses who cases of treason, to have a use of the winnesses who are to be brought against him. The first thing is to arraign the prisoner at the bar, and ask him if be pleads guilty or not guilty. If he do not plead guilty, he is then put on his trial. He is not entitled to demand from the court to have a counsel to defend him, though practically there is little difficulty in procuring one. The jury are then sworn. The number of jurors is twelve, but a much larger number is summoned, and the prisoner is entitled to challenge those of the jury who, he has good cause to believe, will be hostile to him. He can challenge a certain number of these without giving

not, however, entitled beforehand, except in cases of treason, to have a list of jurors supplied to him. At the trial, the prosecuting counsel begins and makes a speech to the jury, commenting on the case. He then calls his witnesses, and it may be observed that it is a public duty for witnesses to attend, and they can be compelled, subject to fine and imprisonment, to attend and he examined. Each witness is first examined by the prosecuting counsel, the cross-examined by the prisoner or his counsel, and then re-examined by the prisoner or his counsel. A witness testifies on his oath, and if he speaks falsely, may be prosecuted for perjury. After the prosecutor's case is closed, the prisoner or his counsel addresses the jury, and if he has any witnesses, calls them, and they are examined, crossexamined, and re-examined in like manner. If the prisoner calls witnesses, the prosecuting counsel has the right of making a speech in reply; and even where the prisoner calls no witnesses, the prosecutor can frequently insist on replying, and thus having the last word. The judge then sums up the evidence by going over it in detail, explaining any points of law that may arise; but he carefully informs the jury that it is for them exclusively to say whether, upon the evidence as laid before them, they think the prisoner was guilty or not guilty. The jury must be unanimous in their finding. If they have a difficulty in agreeing, they are locked up a reasonable time, which means generally about six hours-though no definite limit is fixed-without food, till they agree. If, after this reasonable time has elapsed, they are unable to agree, they are discharged without a verdict. The consequence is that a new jury are summoned, when the same process is repeated. If they find the prisoner guilty, it is for the judge exclusively to pronounce gamey, it is not are large exclusively to problems the appropriate sentence, and some discretion is allowed to the judge on that point. But neither the judge nor the jury can pardon the prisoner; it is for the crown alone to do so, and practically the propriety of doing so is left to the Home Secretary, whose duty it is, if any application reasonably supported by evidence is made to the crown, to inquire into it, which he does by examining the matter and consulting the judge. The settled rule is, that no new trial can be had in criminal cases, even though some error may have been made by the judge or jury. The only mode of obtaining redress is by petitioning the crown to pardon the prisoner, or commute the sentence, as the case may be ; and the Home Secretary advises the crown as

men, who are sworn to try the cause between the crown, as procecutor, and the prisoner. Previous and course, entitled, except in cases of treason, to a copy of the indictment, though in many cases he can indirectly obtain a copy, or at least is generally negative the prisoner entitled, except in cases of treason, to a copy of the indictment, though in many cases he can indirectly obtain a copy, or at least is generally negative the process of treason, to have a list of the witnesses who are to be brought against him. The first thing is one to be brought against him. The first thing is to arraign the prisoner at the bar, and ask him if he pleads gulity for not gulity. If he do not plead gulity, he is them put on his trial. He is not cutified to demand from the certainly there is little difficulty in procuring one. The jury are then swom. The number of pirors is twelve, but a much larger number is summoned, and the prisoner is cutified to demanded the control of the procuring the prisoner of the pury who, he has good cause to believe, will be hostile to him. He can begin any reason; but when he exceeds such number, it must be fine the must state some valid reason. The prisoner is learned to the creation musher of control of these without giving any reason; but when he exceeds such number, it must fine the must state some valid reason. The prisoner is

the plaintiff's counsel sums up his case, and makes preferred by the jury in cases where there is little a second speech : but if the defendant's counsel calls witnesses, then he first makes a speech to the jury, next calls his witnesses, and lastly sums up his case in a second speech to the jury, after which the plaintiff's counsel replies : so that it depends on whether the defendant's counsel calls witnesses. whether or not he has the last word with the jury, The judge then sums up the evidence, and the jury must be unanimous in their verdict. If they do not agree after being shut up a reasonable time, they are discharged, as in criminal cases, and a new jury may be summoned. If there was any mistake of the judge, or any mistake and misconduct of the judy, the losing party may, in many cases, obtain leave to have a new trial, which is conducted in the

same way before other jurors.

In both criminal and civil cases, the functions of the judge and the jury are distinct. The judge has no right to decide the fact, nor the jury to decide the law; but in some cases, the jury cannot be prevented from practically deciding both. Thus, in the case of libel, it was at one time attempted by judges to confine juries to the decision of an unimportant fact ; and the practice of Lord Mansfield in so restricting the functions of juries was attacked by Junius and others, till finally Mr Fox's Act was cases, and made them practically judges of the law also. In other cases, however, the separation of the functions of judge and jury requires very nice disjudges can readily recognise these technicalities. In practice, there can be no doubt that juries can with difficulty be controlled in their decisions on all questions affecting personal and political wrongs; and it is especially to their control over the issues of the latter class of cases, often most judiciously exercised, that the great authority and permanent influence of juries are to be traced. One great advantage of jury trial, over and above the essential the experience and knowledge, as well as the love of fair-play, which are thereby acquired by the people who take part in it. On the other hand, it is often complained that in a great majority of cases, whether caused by qualifications of jurors being too low, and the essential obtuseness of unclucated minds, or the capricions and wayward humours which sway them, the result is little else than a lottery, and even indirect bribery is frequently suspected to operate in some of the cases, especially those which unscrupulous attorneys conduct. Probably the chief reason why jury trial has so long stood, and still stands, so high in public favour is, that notwithstanding all its glaring and familiar defects, no other machinery has ever been devised which is not open to similar or greater strictures.

In criminal trials in Scotland, prisoners have the of trial, to have a copy of the indictment, also a list of the witnesses to be brought forward against them, and likewise a list of the jurors, of whom forty-five are summoned. As regards the order of procedure at a criminal trial, a different practice prevails: the evidence is first given on both sides, and then the prosecutor's counsel addresses the jury, after whom the prisoner's counsel addresses the jury; so that in all cases the prisoner has the last word, and he always knows the whole of the prosecutor's case before he requires to open his own. The judge then sums up the case, as in England. From the forty-five jurors, fifteen are drawn by lot; these constitute the jury, and the verlict of a majority suffices. There is also a vertice of 'Not proven

moral doubt, though the legal evidence is insufficient. In England, such a verdict is equivalent to. and treated as, a verdict of 'Not guilty;' and it is so far final in Scotland, that the prisoner cannot a second time be put on his trial. The expediency of such a verdict has been objected to, as fixing a stigma on the accused person; but the answer has been made, that it is most in conformity with the true result of the inquiry. In Scotland, new trials are not allowed in criminal cases; and in case of pardons, the Home Secretary acts in the same way as he does in England.

As regards trial by jury in civil cases in Scotland, the practice was introduced by a statute in 1815, which imported most of the forms then existing in the English practice. As in England, the jury in civil cases consists of twelve persons. Unanimity is not now essential. By a recent statute, 22 and 23 Vict. c. 7, if, after being kept three hours in deliberation, nine or more of the jury agree on a verdict, such verdict is to be taken as that of the jury; and if, after being enclosed pine hours, the jury, or nine of them, cannot agree, the judge is entitled to discharge them, and generally does so. Moreover, the judge may allow the jury refreshment after they are locked up to deliberate. These latter modifications on the rigid rule have not been yet adopted in England.

A jury de medictate linguæ is a jury half com-posed of foreigners, and it is a privilege which may be demanded by foreigners, when indicted in England for felony or misdemeanour, if so many foreigners are found in the place.

JURYMAST, a temporary spar used to replace a mast which has been lost from any cause, and so to enable the vessel to reach some port for more

JUS DELIBERA'NDI. See ANNUS DELIBER-

JUS DEVOLUTUM, a phrase used in Scotch ecclesiastical law, to denote the right which devolves on the presbytery to present or appoint a minister to a vacant benefice, if the patron do not within six months present a properly qualified person.

JUS GENTIUM, a phrase now translated to mean a branch of International Law (q. v.).

JUS MARITI, a phrase used in Roman law, and adopted in the Scotch law to denote the legal right accruing to a husband qua husband over his wife's property. See HUSBAND AND WIFE.

JUS RELI'CTÆ, in Scotch Law, is the right of a widow to a share in the movable or personal property of her deceased husband. This is a vested or absolute right, and cannot be defeated by the husband's will; and hence the movable estate of the married parties is often called in Scotch law the goods in communion, because, on the death of the husband, there is a division of such goods between the widow, the children, and next of kin of the deceased. If the husband has left children, then the goods in communion are divided into three equal parts, one of which belongs to the widow. If, on the other hand, there are no surviving children or grandchildren, then the goods are divided into two equal shares, one of which belongs to the widow. When the husband dies insolvent, the wife cannot claim her jus reliefæ in preference to the creditors. Though the widow has this right to her jus reliefer at common law, yet, if she entered into an antenuptial contract of marriage, by which she he forty-live jurns, lifteen are drawn by lot; an antenuptual contract of manage, by some onstitute the jury, and the verbite of a accepted an equivalent provision, her right may suffices. There is also a vernict of 'Not-be defeated, provided the contract expressly stated allowed to be given, and which is often the one to be in substitution for the other. In England, there is no such absolute right of a widow to a share of a husband's goods, unless he died intestate, in which case, but in which only, she gets a similar share of the personal estate by virtue of the statute of distributions. See Goods in COMMUNION, HUSBAND AND WIFE, SUCCESSION,

JUS REPRESENTATIO'NIS a phrase adopted by the Scotch from the Roman law, to denote that in heritable succession, and also to a limited extent in movable succession, when one or more of the in movatic succession, when one or more of the culidren of a deceased person have predeceased, the children of such predeceasing children represent their parent, and take his or her share. Thus, if A die, and one of his children, B, had predeceased A, leaving children C, D, E, F, then C, D, E, F collectively take the share of A's property which would have come to B if B had survived A.

JUSHPO'RE, a protected state on the south-west side of Bengal Proper, is entirely surrounded by British territory. It contains 617 square miles and 27,000 inhabitants. Its chief place is a town of the same name. The country, a table-land, is much overrun with jungle, the cleared ground producing grain, chiefiy rice, and oil, and the uncleared portions abounding in wild silk.

JUSSIEU, Dr., the name of a family which, for more than a century and a half, has numbered among its members some of the first botanists of the age .- Antoine de J., who was born at Lyon in 1686, and died at Paris in 1758, was Professor at the Jardin du Roi, and the author of various works on botany; amongst others, an Appendix to Tournefort (Lyon, 1719). He made several voyages and journeys to foreign countries for the purpose of collecting plants, on which oecasions he was accompanied lecting plants, on which occasions he was accompanied by his younger brother Bernard, who co-operated with him in all his investigations, and acted as his assistant.—Bernard De J., who was born at Lyon in 1699, and died in Paris in 1777, contented himself through life in assisting his brother and nephew, without seeking renown by the publication of his own important observations. Having been named superintendent of the gardens at the Petit-Trianon in 1759, he arranged the plants in accordance with a natural system substantially the same as that which his nephew and pupil, Laurent de J., subsequently elaborated in a more perfect manner. As Bernard refused to make publicly known the prin-ciples on which his mode of arrangement was based, the glory of his labours devolved upon Laurent, who alone possessed the key to this botanical enigma. -Laurent de J., who was born at Lyon in 1748, and died at Paris in 1836, was worthy the rich heritage left to him by his learned and disinterested relatives. At the age of 17, he began his botanical studies under his uncle Bernard, and, four years later, was nominated demonstrator and assistant to Lemonnier, the Professor of Botany in the Jardin du Roi. He at once began to reform the arrangement of the gardens and collections of plants under his charge, and to apply to them his own and his uncle's ideas in regard to the natural method. For thirty years he continued to develop his novel views; and when his Genera Plantarum, which he began in 1778, was finally completed in 1789, the natural system was finally established as the true basis of botany (see Botany). In 1793, J. became Professor of Botany in the newly organised Jardin des Plantes, where he continued to teach till 1826, when blindness compelled him to resign his chair to his son Adrien. During his tenure of office, he founded Amen. During his tether of once, he foliated a simple among a the filterary of the Museum, which is one of the arises this paramount obligation?

If we inquire into the nature of justice by exammering the most office of the particulars coming under it, we find such Dictionnaire des Sciences Naturelles, rank among instances as the following: It is unjust to deprive a

the most valuable contributions to the literature of botany, and embody all the results of his own investigations.—Adrien de J., his son, was born investigations.—ADRIEN DE J., his son, was norn at Paris, December 23, 1797, and died in the same city, June 29, 1833. From his earliest years, he had shewn himself a worthy representative of the reputation of his family. As a youth, he carried off the first prize in the Concours, or annual competition among all the collegiate schools of Paris; and on taking the degree of M.D. in 1824, he preseated as his thesis a memoir on the family of the Euphorbiacea, which attracted the attention of all botanists. His subsequent papers on the Rutaceæ, Meliacea, and Malpighiacea, fully realised the expectations that had been entertained of him. His memoir on the embryo of the Monocotyledons is a work of great merit, and was to have been followed by a series of papers on similar subjects, when ill health compelled him to relinquish this project. He was also prevented, by the same cause, from extending his Cours Elémentaire de Botanique (1848) into a complete and general treatise. In 1831, he was elected a member of the Academy, and, shortly before his death, he was nominated to the presidency of that body. J. contributed many valuable papers to the Annales du Muséum, the Comptes Rendus, and the Dictionnaire Universel the Compos icentia, and the Decommute Converses d'Histoire Naturelle; but the services which he rendered to science were not due only to his writings, for his influence as a lecturer was of even higher importance, and has been manifested by the aumber of able lotanists of all nations who have owed their training to him.

JUSTE MILIEU, a French term, signifying the just mean, or, according to the common expression, the golden mean. After the revolution of 1830, this term acquired a political signification, and came into very frequent use, because of the declaration of the organs of Louis Philippe, that the juste milieu was the only principle of govern-ment which could secure the welfare of France.

JUSTICE, one of the cardinal virtues of the ancients, and the name for a principal department of social and moral duty in all ages. Practically, justice is considered to be clear and definite; justice is considered to be clear and definite; but theoretically, there have been great disputes as to its ultimate analysis and the source of its binding quality. It has been maintained very generally, that both the perception of what is just and unjust, and the powerful sentiment in favour of the one, and in opposition to the other, are instincts of our nature, or make a part of that comprehensive instinct termed Conscience, or the Moral Sense. On the other hand, it has been held that utility, in other words, the general interests of mankind at large, is what determines justice, and that the sentiment enforcing it grows out of a regard to those interests.

The supposed instinctive origin of the sense of justice is encumbered with all the objections that attend the hypothesis of innate notions generally, so powerfully set forth by Locke in his Essay on the Understanding (see ETHICS). But neither is the other view free from serious difficulties, of which the greatest is the universally felt contrast between the Just and the Expedient, or the simply useful. We are frequently called upon to sacrifice expediency to justice, which would seem to imply an obligation higher than the interests of mankind. Fiat justitia, ruat orlum—'Let justice be done, although the universe should collapse.' Whence

man of his personal liberty, his property, or any other thing belonging to him by law; justice, therefore, requires us to respect each one's equal rights. Sometimes, however, we call the law itself unjust, in which case we sympathise even with disobedience to it. It is then supposed that there is some higher law that should have preference—as, for example, the moral law. Thus, it is conceived by most men at the present day to be unjust to hold our fellowcreatures in slavery. Again, it is considered unjust to break faith with any one; in other words, promises and engagements must be fulfilled in order to do justice. It is unjust to shew partiality in cases where all are equally entitled to favours. Impartiality in public tribunals is of the very essence of justice. Nearly the same idea is expressed by the notion of equality. In all these cases, there are some definite individuals-one or more-that are considered to be possessed of a right, and to be wronged if that right is not fulfilled. Herein lies the difference between justice and Benevolence or generosity, this last being the mere overflowing of our disinterested fellowfeeling, which no one can claim as a right, and for whose neglect we are not punished.

These particulars, which are among the most marked instances of the property in question, do not suggest any qualities present in all just actions, and absent in the opposite, excepting the existence of a so-called right on the part of somebody, and also the sentiment which demands the punishment of those that violate those rights. We are no nearer the solution of the original question, which is, Why should these rights be either determined or enforced on any other ground than expediency, or the wellbeing of mankind? It is admitted on all hands that the just and the expedient concur in the long-run, but yet people demur to making expediency the test of justice. Probably, there is something peculiar in the application of the term 'expediency,' which is the cause of the apparent paradox whereby the two

qualities are made the same, and yet not the same. This is really the case. Of the social regulations that affect the wellbeing of mankind, there are two widely different classes. In the first place, there are the interests of Security, or those requisites without which human society could not be main-tained. Respect for liberty, life, and property, and the performance of engagements, are essential to the very existence of human beings in society: if were to escape with impunity, disorganisation and ruin would be the inevitable consequences. The strength of the sentiment that injustice calls forth is therefore not a matter of surprise; cristence is at stake, and whatever be the force of our impulse of self-preservation, and our desire of the preservation of our fellow-beings, the same will be the measure of our repugnance to the acts that endanger both the one and the other. Compare these interests with another class of things, also for the good of society, as, for example, the promotion of trade, manufactures, or seience, all which are very advantageous to mankind, but not absolutely essential to our existence. They at most express the difference between two grades of happiness, not the difference between existence and annihilation. The contrast between the just and the expedient may now be apparent; both relate to the welfare of mankind; but the one is concerned with being, the other with well-being, to use a favourite distinction of Oliver Cromwell's. The one is so immensurably superior in point of urgency to the immensionably superior in point of urgency to the other, as to account for the very different degrees. JUSTICE, Lord CHIEF, the title given in of our attachment to the two interests. The super-England to the chief judge of the Courts of Queen's rior claims of justice to generosity flow from the Bench and Common Pleas. The chief of the former same considerations; in fact, the argument is an court is called the Lord Chief-justice of England

identical one. We can live without generosity, or with some very small share of it; a thoroughly selfish community, if not also very short-sighted as well, might exist; but a community where justice was nowhere observed, could not exist. Still, the grounds of justice are and can be no other than general utility. 'If,' says Mr John Stuart Mill, that expression does not seem to convey a sufficient feeling of the strength of the obligation, nor to account for the peculiar energy of the sentiment, it is because of the extraordinarily important and impressive kind of utility which is concerned. The interest involved is that of security, to every one's feelings, the most vital of all interests. All other earthly benefits are needed by one person, not needed by another; and many of them can, if necessary, be cheerfully foregone, or replaced by something else; but security no human being can possibly do without; on it we depend for all our immunity from evil, and for the whole value of all, every good beyond the passing moment, since nothing but the gratification of the instant could be of any worth to us, if we could be deprived of everything the next instant by whoever was momentarily stronger than ourselves. Now, this most indispensable of all necessaries, after physical nutriment, cannot be had unless the machinery for providing it is kept unintermittedly in active play. Our notion, therefore, of the claim we have on our fellow-creatures to join in making safe for us the very groundwork of our existence, gathers feelings around it so much more intense than those concerned in any of the more common cases of utility, that the difference in degree becomes a real difference in kind. The claim assumes that character of absoluteness, that apparent infinity, and incommensurability with all other considerations, which constitute the distinction between right and wrong, and that of ordinary expediency and inexpediency. The feelings concerned are so powerful, and we count so positively on finding a responsive feeling in others (all being alike interested), that ought and should grow into must, and recognised indispensability becomes a moral necessity, analogous to physical, and often not inferior to it in binding force, On Utiliarianism.

If there were such a thing as intuitive, eternal, and immutable justice, independent of all the concerns of this world, and paramount over the highest interests of mankind, it ought to be something clear and unambiguous, the same in all ages and nations, being revealed to the human mind without any reference to men's outward circum-But, not to repeat the arguments that stances. refute this notion as respects morality in general (see ETHICS), it may easily be seen that as to justice in particular there is a very great disagreement among mankind in everything except the first essentials of social security namely, the respect for legal rights, the keeping faith, and the like, These things men in all ages have recognised as a part of justice; but in the things less essential to the common safety of mankind, where notions of just and unjust are still admitted and pleaded, there is anything but unanimity of opinion; nav, what is considered just in one country and time, is considered unjust in other countries or other times. Primogeniture is one example; slavery is

JUSTICE, COLLEGE OF. See COLLEGE OF

while the other is merely the Lord Chief-justice of the Court of Common Pleas.

JUSTICE OF THE PEACE, in England, is a person appointed by commission of the crown, or by act of parliament or charter, to exercise certan judicial authority in a county or borough. The person who practically appoints to the office is the lord chancellor, who in his discretion may include in the commission certain persons who must have an estate of £100 a year, clear of all rents and charges; or if he has no estate in possession, but is entitled to the reversion thereof. if it be of the rent of £300 a year. All persons having the above qualification may be appointed justices of the peace; but practising attorneys or solicitors are not eligible for counties, though they are for boroughs. The office of justice of the peace is entirely gratuitous, for they receive neither salary nor fees, and hence the justices are often called the 'great unpaid.' But in modern practice it has been found necessary to deviate from this rule, and to appoint in all the cities and many large towns certain paid justices called stipendiary magistrates at a fixed salary, who discharge the duties of justices, which are necessarily onerous and important. In the city of London and certain other places, the mayor and certain corporators are con-stituted by charter justices of the peace by virtue of their office.

The institution of justices of the peace is very ancient. Previous to 1327, there were conservators of the peace in every county chosen by the freeholders out of the principal men of the county to perform similar duties, but by a statute of Edward III., a change took place in the practice, and ever since, the election of justices has been taken from the people, and exercised by the crown. At first, however, they were still called merely conservators or keepers of the peace, and were not dignified with their present title. Gradually, the office grew more and more important, in consequence of many statutes adding to their duties and jurisdiction, until, in the thirtieth year of the reign of Elizabeth, the form of commission was revised, and was settled nearly in the form which is now used. The commission is in the name of the sovereign, addressed to certain persons by name, and directing them 'to keep our peace in our county of ----, and to keep all ordinances and statutes for the good of the peace, and for the good rule and government of the people, and to chastise and punish all persons that offend against the said ordinances.' The commission then assigns them to inquire by the oath of good and lawful men of all manner of felonies, or good and rawal ment of an infiling of colories, possonings, enchantments, sorceries, arts, magic, trespasses, forestallings, regratings, engrossings, and extortions whatsoever, and of all crimes and offences, &c.' Formerly, it was usual to select the most eminent to be of the quorum, a name derived from the first word of the clanse quorum aliquem vestrum A, B, C, D, &c. unum esse volumus, and one of these must always be present; but now nearly all are included in the quorum crause, and longer an objection to a warrant that one of the convicting justices is not of the quorum. new justices are appointed, the commission is sent by the clerk of the peace to the crown-office, where the names are inserted. On appointment, the justice must take an oath that he possesses the necessary estate as a qualification; and if he act

country. As the appointment is practically in the hands of the lord chancellor, it is a frequent charge brought by one political party against another that the appointments are given as rewards for political service; but owing to the frequent alternation of power among parties, the undue preponderance of one set of politicians is speedily neutralised by the

acts of their successors. acts of their successors.

The functions of justices of the peace are exceedingly multiarious in the present day, for there are few departments of the law in which the aid of justices is not required for purposes either of administration or of judicial decision. For the last century especially, there has been a continual addition to their duties created by successive acts of parliament, and this is caused by certain remedies which either did not exist before being created, or by their being transferred from other courts and jurisdictions to the summary powers of justices. Of late, about twenty statutes every year involve material alterations, chiefly by way of addition to this branch of jurisdiction. To enumerate all the heads of law which in part have been confided to the disposal aw which in part have been contact to the disposal of justices, would require too much space; but it may suffice briefly to indicate the general character of their duties. These are either administrative or judicial. Thus, in carrying out the provisions of the poor-law, if the parish officers require to remove a pauper from one parish to another, instead of intrusting this power to these officers, they are required to go before justices of the peace, so as to shew the circumstances under which the removal takes place, and to satisfy the justices that the statutes on the subject have been complied with. But the great and distinguishing functions of justices are concerned in the judicial decision of what are called offences punishable by means of summary convictions or orders. The theory on which all this jurisdiction is founded is, that while the graver crimes must be left to the ordinary remedy of an indictment, and the slighter wrongs to that of an action at law, there are many intermediate offences which are not worthy of the solem-nity of an indictment, nor yet fit to be left to the slow, expensive, and often clusory result of a civil action. Hence this intermediate class of cases arises, which justices can punish by fine and imprisonment swiftly and decisively. Thus, if certain classes of servants employed in agriculture or mechanical arts servants employed in agriculture or meanancia arise suddenly break their engagement, they may be fined or imprisoned by justices, for if there were no speedy remedy like this, the mischief often caused to the master might go unredressed. In like manner, justices punish poaching offences, whether against fish or game, personal assaults,

trespasses, forestallings, regratings, engressings, and extortions whatseever, and of all crimes and offences, &c.' Formerly, is was usual to select the most eminent to be of the quorum, a name derived into the first word of the clanse quorum aliquem returnan A, B, C, D, &c. usuam classe; and it is no longer an objection to a warrant that one of the most proper and objection to a warrant that one of the most proper and objection to a warrant that one of the most proper and objection to a warrant that one of the most proper and objection to a warrant that one of the most proper and objection to a warrant that one of the most proper and objection to a warrant that one of the most proper and objection to a warrant that one of the proper and objection of the class of misdemeature which the proper and objection to a warrant that one of the proper and objection of the proper and objection to a warrant that one of the proper and objection objection to warrant the committed objects of the proper and objection objection to warrant the committed objects of the proper and objection objection to warrant the committed objects of the proper and objection objection to warrant the committed objects of the proper and objection objection to warrant the committed objects of the proper and objection objection to warrant the object of the proper and objection objection to warrant the committed objects of the proper and objection objection to warrant the committed objects of the proper and objection objection to warrant the committed objects of the proper and objection objection to warrant the committed objects of the proper and objection objection to warrant the committed objects of the proper and objection objection to warrant the committed objects of the proper and objection objects on the class of mission objects on the object of the proper and objection objection to warrant the class of the cla

fike malice can be proved against them, they seldom he concurred. In case of the sovereign's minority, escape being sued and amerced in heavy damages.

As regards Scotland, the first act establishing justices was that of 1587, c. 82. The office was further regulated by acts in 1609, 1617, 1633: by instructions during the Protectorate in 1655, embodied in the act 1661, which is the principal statute regulating the duties of justices. Two justices are held to form a quorum. The jurisdiction of justices is confined in practice to the penal statutes in reference to revenue, highways, fishings, game, and public-houses, and in many of these the sheriffs have cumulative jurisdiction. Their ordipary criminal jurisdiction is confined to breaches of the peace, petty thefts, and trifling assaults. They appoint a procurator-fiscal or public prosecutor for their own court. The civil jurisdiction is chiefly confined to the small-debt court. In many counties, the sheriffs' small-debt court is the only tribunal resorted to. No particular qualification as regards rank or property is essential. The appoint-ment is less popular, and the range of authority and jurisdiction, as just shewn, is much inferior to what it is in England. This is chiefly due to a different arrangement of judicial business, and to the antiquity of the practice of local sheriff courts in Scotland, which are presided over by trained lawyers, who are paid by a fixed salary. These officers absorb much of the multifarious jurisdiction exercised by justices of the peace in England.

JUSTICE-CLERK, Lonn, a hich judicial officer in Scotland, being the second highest judge in point of rank, and in the absence of the Lond Justice general, the presiding judge of the Court of Justiciary. His usual duty is to sit as chief of one of the divisions of the Inner House called the Second Division of the Court of Session (a.v.). The office in its origin was, as its anse imports, of a more

JUSTICE-GENERAL, LORD, the highest judge in Scotland, also called the Lord President of the Court of Session. Formerly, the office of Justicegeneral was a sincerre, and not a judicial office, but the title is now, since 1831, associated with that of

the Lord President.

JUSTICES, LORDS. From the times of the Norman and Plantagenet kings, it has been the occasional practice in England for the sovereign to appoint one or more persons called Lords Justices, to act as his substitutes in the supreme government during his absence from the kingdom. Subsequent to the Revolution, these appointments have been made by letters-patent under the great seal, and the authority of parliament has sometimes been required in confirmation of their powers. On five occasions, such appointment was made by William III. when going abroad, though while his queen was alive, he delegated his authority to her during his absence. The statute 12 and 13 Will. III., settling the succession on the House of Hanover, provided 'That no person who shall hereafter come to the crown shall go ont of the dominions of England, Scotland, or Ireland, without consent of parliament;' but this clause was repealed by I Geo. I. c. 2, and the first sovereign of the House of Hanover, during five of his absences in Germany, made an appointment of lords justices. George IV., on his visit to Hanover, delegated his authority to 19 guardians, of whom the Duke of York, heir-presumptive, was one. On none of the absences of her present Majesty from her kingdom has there been any delegation of the royal authority; and on one of these occasions, Lord Chancellor Lyndhurst stated in the House of Lords that the law officers regarded it nanecessary in point of law to appoint lords justices, in which opinion

he concurred. In case of the sovereign's minority, a regency has generally been resorted to. The powers of lords justices have been assally limited in the matter of pardoning and reprieving criminals, summons or prorogation of parliament, the disposal of public moneys in the treasury, and of church preferment in the gift of the crown. The lords justices appointed under the commissions of 1719 and 1729 could continue the existing parliament by short prorogations, till otherwise directed under the royal sign-mannal—the other acts here specified could not be exercised without the special signification of the royal pleasure, except when necessary for the public service. The power to create peers for the public service. The power to create peers not been delegated, by Charles I. in 1644; and 100 feet been delegated, by Charles I. in 1644; and in whose favour, afterwards Earl of Ghomeyan, in whose favour, afterwards Earl of Ghomeyan, in whose favour, accordance to the create of the control of Lords.

Lords justices have sometimes been appointed to carry on the government of Ireland in place of a viceroy; in modern times, this has only been done during occasional absences of the lord-livement, or in the interval between the demise of one lordheutenant and the appointment of his successor. These lords justices have usually been the Lord Primate, the Lord Chancellor, and the Commander

of the Forces.

JUSTICES' CLEIK. an officer, generally a solicitor, appointed by justices of the peace in England is assist them in their duties. Owing to the justices a great part of the peace of the law, and yet being called we not being trained hwyers, and yet being called we not being trained hwyers, and yet being called we not be a persion of much constitution of the law, and construct the persion of much local inthuser, and in practical person of much local inthuser, and in practical effect gaides and controls the justices are properly speaking, not a public officer, but in the nature of a servant of the justices. By various statutes, be is entitled to receive fees in connection with the business transacted by the instinces.

JUSTICIARY COURT, the highest criminal court in Scotland. Its judges are five of the judges of the Court of Session—viz, the Lords President, Justice-clerk, and three others appointed by patent. The quorum of the high court consists of three judges. It sits usually in Edinburgh, but also holds circuit-courts twice a year in some of the locate towns, and three in Glasgow, the kingdom corrections, and three in Glasgow, the kingdom or circuits. The jurisliction embraces all crimes whatever; and it is an appellate court as regards inferior criminal tribunals. Its decisions are final, there being no appeal to the House of Lords.

JUSTIPIABLE HOMICIDE is the killing of a human creature without incurring legal guilt, as where a man is duly sentenced to be hanged; where one, in self-defence, necessarily kills another to preserve his own life, &c.

JUSTIFICA/TION, a term of technical theology, Among Protestants generally it is beliaved to express an act of divine favour whereby a sinner is absolved from the penalty of his sins, and accepted as righteous, not on account of anything in himself, but on account of the righteousness of Christ imputed to him. According to this view it is a purely forensic net—the act of a judge sitting in the forum, or pluce of judgement, and acquitting the condemned by an exercise of elemency, in consideration of the merits of norther, who has paid the penalty which was justly his due. In this forensic secons of the word the aposte is understood by many Protestants to speak (Rom, iii. 26) of old as 'this justifier of him which believed in Jesus.'

Justification is not by Protestants generally believed

to be attained by virtue of any spiritual birth. In the opinion of others who appear to have a clearer view of Christian faith as shown by their Christian works, it is the inward birth of Christ in us bringing forth righteousness and holiness that justifies us, which new birth, having removed and done away the contrary nature and spirit that bore rule and brought condemnation, comes into dominion over all in the heart of the believer. Those who are thus clothed with Christ, who have put on Christ, are they whom God therefore truly accounteth righteous and just. The formal cause of justification is not the works, they being bat an effect of it, but this inward birth, by which we come to be made partakers of the divine nature and are made one with Christ, as the branches with the vine, so that his obedience becomes ours, his righteousness oars, his death and safferings oars. Many Protestant sects esteem the distinction between justification and sanctification a cardinal one, but others above its termination had almost proved fatal, by a referred to believe the term should be more frequently domestic revolution, to the authority of J. himself. understood as implying making one jast, its original signification, and not repating one merely so, and to in the circus in 532 was but an outburst of political be identical with sanctification.

The doctrine of justification is laid down plainly in the Epistle of Paul to Titus, when he says: 'According to his mercy he hath saved us by the washing of regeneration, and renewing of the Holy Ghost,' &c., and clearly ascribes the immediate cause of justification to this inward work of regeneration, which is Jesus Christ revealed in the soul, the washing or regeneration being that inward power and virtue whereby the soul is cleansed and clothed with the rightconsness of Christ. This view of justification appears to be that entertained by many of the Christian Fathers of both the earlier and the latter age of the Church. Melanchthon says, 'To be justified by faith signifies in Scripture not only to be pronounced just, but also of unrighteous to be made righteous.' According to St. Augustine, to be justified was no other than of unjust to be made just, through the grace of God, for

Christ.

Zninglius asserts ' that the sanctification of the Spirit | is true justification, which alone suffices to justify."

JU'STIN, a Roman historian who flourished, in all probability, in the 3d or 4th c., although some assign him an earlier date. His History—which is of great value, from its being our only authority on many important points—is merely a selection of passages from the Universal History of Trogus Pompeius, a work now lost.

JUSTINIA'NUS (JUSTINIAN) I., FLAVIUS Anicius, nephew, by the mother's side, of the Emperor Justin, was born 483 A.D., in the village of Tauresium, which afterwards grew into the splendid city of Justiniana, and on the site of which the modern Kustendje stands. Although of obscure parentage, he shared the success of his maternal uncle, Justin, heing invited at an early age to Constantinople, where he received a careful education, and if the reports of his courtly biographers can be accepted, attained to considerable eminence in philosophy, theology, and law, as well as in the more elegant pursuits of poetry, music, and architecture. When his uncle was elevated to the purple in 518, he appointed J. commander-in-chief of the army of Asia. The tastes of J., however, inclining him rather to civic pursuits, he declined this appointment, and remained attached to the court of Constantinople. In 521, he was named consul, and during the remaining years of the reign of his uncle, he continued to exercise great influence. In 527, the Emperor Justin, by the advice of the senate, proclaimed him his partner in the empire. Justin survived the step but a few months, and J. was crowned as sole emperor, along with his wife,

the famous Theodora, whom, despite of her more than dubious antecedents as an actress, he had raised to the position of his wife. J., ou his accession, was in his 45th year. His reign, which extends over 38 years, is the most brilliant in the history of the late empire. Although himself without the taste or the capacity for military command, he had the fortune or the skill to select the ablest generals of the last days of Roman military ascendency. Under the direction of his generals, and especially of the celebrated Narses (q. v.) and Belisarias (q. v.). his reign may be said to have restored the Roman Empire, at least in outward appearance, to its ancient limits, and to have reunited the East and West under a single rule. In his first war—that with Persia—he concluded a treaty by which the crisis that had so long threatened was at least warded off; but the rejoicings which celebrated A conflict of the so-called Blue and Green factions discontent, which went so far as to elect a rival emperor, Hypatius. J. himself was struck with dismay, and had made preparations for flight; but the vigour and determination of Theodora arrested the revolt. Narses, with a relentless hand, repressed the tumults, 30,000 victims having, it is said, fallen in a single day. By the arms of Belisarius, the Vandal kingdom of Africa was re-annexed to the empire; and the same general, conjointly with Narses, restored the imperial authority as well in Rome as in Northern Italy and a large portion of Spain. One of the most extraordinary, though in the end ineffective, works of the reign of J. was the vast line of fortifications which he constructed, or renewed and strengthened, along the eastern and south-eastern frontier of his empire. These works of defence, and the construction of many public buildings both in his capital and in other cities of the empire, involved an enormous expenditure, and the fiscal administration of J., in consequence, pressed heavily on the public resources; but it is admitted to have been ably and aprightly conducted. It is, however, as a legislator that J. has gained renown. Immediately on his accession, he set himself to collect all previous legislative enactments which were still in force; and in order to do this thoroughly, he first compiled a code, which comprised all the constitutions of his prede-cessors (527—529). See Code. The authoritative commentaries of the jurists were next harmonised, and published under the title Digesta Pandecta (529 —533). See PANDECTS. The code was republished in 534, with the addition of J.'s own constitutions. His third great legal undertaking was the composi-tion of a systematic treatise on the laws, for the guidance of students and lawyers. This was published a short time before the Digest, under the title of Institutiones, i. e., 'Institutes.' All these works were accomplished under the careful superintendence and direction of Tribonian, and were written originally in Latin. The later treatises which J. caused to be written were in Greek, and were entitled Novellæ, i. e., 'New Works.' The character of J. as a ruler contrasts favourably

with that of most of the emperors, whether of the earlier or the later empire. His personal virtues were of a class and in a degree soldom united in one of such station; and his public administration, with the single exception of that of ecclesiastical affairs, in which he was an arbitrary and imperious intermeddler, exhibits great ability, and just and apright inten-tions. He died at the age of 83, and in the 38th year of his reign, November 14, 565.

JUSTI'NUS, surnamed the MARTYR, and

frequently the PHILOSOPHER, a Father, and, after Tertullian, the most distinguished apologist of the Christian Church, was a native of Flavia Neapolis, a Roman city erected on the site of the ancient Sechem. in Samaria. The date of his birth is variously assigned to the years 89, 113, 114, and 118 A.D. His father Priscus was a heathen, and J. was educated in the religion of his father. He became an ardent student of the philosophy of his age, beginning with the school of the Stoics, but finally adhering to that of the Platonists. With the last, as he himself relates, he was in the commencement highly satisfied; but, as he was one day wandering along the sea shore, he encountered a man of mild and venerable aspect, who created in J.'s mind a desire for higher knowledge than Plato had reached, referring him to the study of the Jewish prophets, and through them to the great Christian teacher whom they foretold. The result was his conversion to Christianity, at some date between 119 and 140 A.D. After his conversion, he retained the garb of a philosopher, but, as a Christian philosopher, he strove by his writings and his instructions to bring others to the truth which he had himself discovered. He is said to have been beheaded about the year 165, in the reign of Marcus Aurelius, because he refused to offer sacrifice to the heathen gods. His death is attributed by the ancients to the enmity and malignant arts of the Cynic philosopher Crescens. The works of J., although not very voluminous, are highly interesting and important. The books ascribed to him with certainty are two Apologies for the Christians, the first addressed 'to Autoniaus Pius, the second 'to the senate;' a Dialogue with Tryphon the Jew, which professes to be the record of an actual discussion held at Ephesus. The Address to the Greeks is not so certainly a genuine work of J., and the same may be said of his Exhortation to the Greeks, his Letter to Diognetus, and his work On the Monarchy of God, an argument against the polytheism of paganism. The other works ascribed to him are certainly spurious. The first edition of his works is that of Robert Stephens (Paris, 1551). The Benedictine edition of J. is that of Maran (Paris, 1742), and a recent edition has appeared in Germany by Professor Otto, 2 vols. Svo (Jena, 1842-1844).

JUSTINUS L, or JUSTIN THE ELDER. Emperor of the East, was born in 450 A.D., of barbarian parents, and entered as a private into the emperor's body-guard, of which he rose to be commander. He held this last post till the death of Anastasius L, whom he succeeded on the throne, 518 A.D. Feeling that, from his total want of learning, he was unfitted to direct the internal civil administration. he wisely resigned this duty to the quæstor Proclus, whose administration gave general satisfaction. In 519, he entered into an arrangement with the pope, which resulted in a cessation of hostilities between the Greek and Latin churches. In 523, he resigned to Theodoric, king of Italy, the right-which till this time the eastern emperors had always exercised —of appointing 'consuls' in Rome; and the same year he became involved in a war with the king of Persia. In 525, occurred a terrible earthquake. which laid Edessa, Pompeiopolis, Corinth, and Dyrrachium in ruins, and the ill-fated Antioch was completely destroyed by fire and inundation combined. On hearing the news, J. took off his crown, pnt on mourning, and ordered a supply of money and necessaries for the unfortunate sufferers. Sometime before his death, which took place in August 527, he had adopted his nephew Justinian, and associated him with himself in the government.

JUSTINUS IL, or JUSTIN THE YOUNGER.

in 565 A.D., and espoused Sophia, the niece of the Empress Theodora, a beautiful and able, but revengeful woman. In order to ingratiate himself with the people, he immediately paid his prede-eessor's debts, and gave considerable largesses to the lower classes. His rule was weak and despicable, and though the empress was the de fucto sovereign. she too often allowed her passions to blind her reason. Through her influence, Narses (q. v.) was dismissed from the exarchy of Ravenna, though at the time J. was fully aware that the Longobards were meditating an invasion of Italy. The joy of these savages, on hearing of the disgrace of the one man whom they dreaded, was excessive; and in 568 they burst like an avalanche upon Italy, which from this time was for ever lost to the Greek Empire. The emperor had better fortune towards the east and north; but though he had enough of able generals, such as Marcian, Tiberius, and Mauricius, yet the incompetent government found it impossible to raise a disciplined army, and was obliged to have recourse to the fatal expedient of employing mercenaries. Khosrû, king of Persia, took Dara after a long and gallant resistance, and followed up his success by conquering Mesopotamia and Syria. He was repeatedly driven back by Mauricius, but returned with redoubled fury. In the midst of this war, J. died, 26th September 578, after appointing Tiberius, one of his generals, as his successor. J. had been insane from 574, from which time till his death the supreme authority was in the hands of the empress.

JUTE is the fibre of an Indian plant, the Corchorus capsularis of botanists (see Corchorus), and another species, C. olitorius; the former, however, is the one from which the fibre is chiefly obtained. The fibre constitutes the inner bark, and is separated by

Jute (Carchorus capsularis).

maceration. It is sometimes obtained 12 feet long. Jute-fibre has become a very important part of the commerce of this and other countries, although its commerce of this and other construct actions introduction to Europe for the purposes of weaving is of comparatively recent date. Previous to 1830, it was scarcely known, except in the form of gunny-bags, in which sugar, rice, pepper, and other products of India had been constantly imported, without attracting attention to the nature of the material of which they were made. When the raw Emperor of the East, succeeded his uncle, Justinian I., fibre was first introduced, its great length led to

the impression that it would be useful for cordage; subsequent trials, however, soon shewed that its liability to injury from moisture made it useless for that purpose. But its capabilities for employment in such fabrics as matting and coarse carpeting soon became apparent, and a vast trade sprang up. Its employment for coarse bagging is immense; it is used for the cottons of India and America; all the sugar and rice, the pepper, ginger, cinnamon, gums, dye-stuffs, oil-seeds, and numerous other articles of Indian produce, reach us in gunny-bags, and almost every producing country either imports gunny-bags or jute for making them. In Great Britain, large quantities of gunny or jute bagging are manufac-tured at Dundee and other places; and it has the beneficial effect of relieving large quantities of hemp for the more important purposes of sail-cloth and cordage. Jute can be bleached only with difficulty, otherwise, the worn-out gunny-bags would furnish an abundance of paper material. Very much employed, especially in India, for making inferior kinds of wrapping-paper. In 1866 guonies and gunnybags, valued at £102,858, were exported from British India. In 1869 there were imported into the U. States 5743 tons of gunnies and gunny-bags, valued at \$347,-000. It is imported in bales, usually weighing about

32 wits, each state of C. capsularis has been successfully attempted in England, a good crop of fibre being obtained; but the plants, although attaining 14 feet in height, did not ripen their seeds well.

JÜTERBOGK, a small manufacturing town of Prussia, in the province of Brandenburg, is situated on the Nuthe, 27 miles south of Potsslam. Here considerable wool and flax markets are held, and wine is produced to some extent. Woollen-cloth manufactures, spinning, weaving, and dyeing are also carried on. Pop. 6237. In the vicinity is the field of Dennewitz, where the Prussians defeated the French under Ney and Oudinot, September 6, 1813.

JUTLAND (Dan, Juliand), the only considerable peninsula of Europe that points directly north, forms a portion of the kingdom of Denmark, and comprises the province of North Jutland. The duchy of Sleavig (q. v.), now separated, was called by the Danes South Jutland. The province of North Jutland has an area of 3670 square miles, and a population (1860) of 705/318. See Descarks. J. is population (1860) of 705/318. See Descarks. J. is by the Cimbri (q. v.), and from this circumstance in has received the name of the Cimbrian Peninsula, or Chersonesus. In historical times, we find it inhabited by the Jutes, who took part in the expedition of the Saxons to England. As allies of the Saxons they waged war with Charlenagne, and under the name of Normans (Northmen), frequently desolated the coast of Germany and France.

JUVENALIS, DECEMBS JUNIUS, the Roman statist, was born at the Volscian town of Aquinum.
The year of his birth is unknown; but it may be taken for granted that he was a youth in the reign child sent to another reformatory school than the of Nero; that he was come to man's estate, and one named by the magistrate, on paying the addition of the survived into the times of Hadrian (117—118 A. D., He scenus to have enjoyed a competence, cutyer by the school is paid by the 18 A. D., He scenus to have enjoyed a competence, and the presence of the conveyence of the conveyen

posterity depends altogether on his writings-on his sixteen satires, still surviving, which occupy the very first rank in satirical literature, and are of priceless value as pictures of the Roman life of the Empire J. and Horace respectively represent the two schools into which satire has always been divided; and from one or other of them every classical satirist of modern Europe derives his descent. As Horace is the satirist of Ridicule, so J. is the satirist of Indignation. J. is not a man of the world so much as a reformer, and he plays in Roman literature a part corresponding to that of the prophets under the Jewish dispensation. He uses satire not as a branch of comedy, which it was to Horace, but as an engine for attacking the brutalities of tyranny, the corruptions of life and taste, the crimes, the follies, and the frenzies of a degenerate state of society. He has great humour of a scornful, austere, but singuhas great numour of a scornful, austere, but singularly pungent kind, and many noble flashes of a high moral poetry. We would especially point out that the old Roman genius—as distinct from the more cosmopolitan kind of talent formed by Greek culture-is distinctly discernible in Juvenal. He is as national as the English Hogarth, who perhaps gives a better image of his kind and character of faculty than any single English humorist or moralist that we could name. J. has been better translated in our literature than almost any other of the ancients. Drydcu's versions of five of his satires are amongst the best things Dryden ever did. Dr Johnson imitated two of the most famous in his London and Vanity of Human Wishes; and the version of the whole of them by Gifford is full of power and character. The best known modern edition of J. is that of Ruperti, and there are good recent English ones by Macleane and Mayor.

JUVENILE OFFENDERS. The practice of singling out offenders of a tender age from adult offenders, and subjecting them to different punishment and reformatory treatment, has gained ground of late years. In the eye of the law, persons are considered capable of committing crime when of the age of seven, and are punishable like other persons, But in England and Ireland, in cases of larceny, whenever a person under the age of 16 is brought before justices, and is convicted, he or she may be committed to the house of correction for three calendar months or less, or, in the discretion of the justices, shall be fined £3 or less; or if a male under 14 years, shall be once privately whipped (with a birch rod, not more than 12 strokes), either instead of or in addition to such imprisonment. The juveof or in addition to stein man isomers. The late-ing office is the process of the peace, and may insist upon being tried by jury, if he prefer it. And in all cases of juveniles under 16 being convicted of offences, the justice or magistrate may, in addition to the sen-tence then passed, provided such sentence is not less than 14 days' imprisonment, direct the offender, at its expiration, to be sent to a reformatory school for a period of not less than two years, and not more than But the parent or guardian may have the child sent to another reformatory school than the one named by the magistrate, on paying the additional expense, if any. The expense of the conveyance of the offeader to the school is paid by the county or borough, but his continued maintenance there must be paid for by the parent or step-parent,

and in Latin, Kappa, or k, was supplanted by c (see and in Latin, Kappa, or k, was supparative by a lace Alphabet, and letter Cl, except in the case of a few words, as Kalenda and Kaso. In the languages derived from Latin, accordingly, k is used only in writing foreign words. Although unknown to the Angle-Saxon alphabet, it has in modern English to a considerable extent taken the place of c in words of Saxon origin. See C. The character Koppa, or q, has been retained in modern alphabets, as it was in Latin, only in the combination qu. This is clearly a relie of the primitive nature of written antal articulation followed by a particular vowel sound : so that there was one character for ba, and another for bo : one for ka, and another for ko or ku, as in hieroglyphs. K (q, or c hard) is the sharp mute of the guttural series, k, g, ch, gh, See LETTERS. The interchanges of k are indicated under C.

KAABA (Arab. 'square house'), the name of an oblong stone building within the great mosque of Mecea (q. v.). According to the legend, Adam first worshipped on this spot, after his expulsion from Paradise, in a tent sent down from heaven for this purpose. Seth substituted for the tent a structure of clay and stone, which was, howrebuilt by Abraham and Ishmael. Certain it is that the building existed from time immemorial, and served the Arabs before Mohammed as a place of idolatrous worship, probably to Zohal (Saturn). It is, as it now stands-rebuilt is 1627-35 to 40 feet high, 18 paces long, 14 broad. Its door, coated with silver, is opened only three times in the year -once for men, once for women, and once for the purpose of cleaning the interior. Next to this door, in the north-east corner of the edifice, is set the famous lava-like Black Stone which, since the second year of the Hedjrah (q. v.), has served as Kibleh, i. e., as an indicator of the direction towards which all Moslems must turn in their prayers. This stone, which is said to have dropped from paradise together with Adam, is held in extreme veneration, and one of its principal names is 'The Right Hand of God on Earth.' It was It was originally of white colour, but the sins of mankind have caused it to shed so many silent tears, that it has become (externally) quite black. Others explain this change of colour by the unnumbered kisses and touches bestowed upon it by the pilgrims, part of whose ccremonies (see HAJJ) consists in compassing the K. seven times, each time either kissing this stone, or touching it with the hand, and kissing the latter. A smaller stone, to which, however, less veneration is shewn, is set in the south east corner of the Kaaba. The outside of the K, is annually covered anew with the richest black silks, on which are embroidered sentences from the Koran in gold ; a pious contribution first on the part of the califs, later of the sultans of Egypt, now of the Turkish emperors. The K. has a deuble roof, supported by pillars of aloe-wood, and it is said that no bird ever rests upon it. The whole edifice is surrounded by an enclosure of columns, outside which there are found three oratories, or places of devotion, for different sects; also the edifice containing the well Zem-Zem, the eupola of Abbas, and the Treasury. All these are further enclosed by a splendid colonnade, surmounted by cupolas, steeples, spires, crescents, all gilded and adorned with lamps, which shed a brilliant lustre at night. These surroundings, between which and the K. run seven paved causeways, were first devised by Omar, for the better preservation of the K. itself.

KAMA, or CAMM (Antilops Counci), as species of antelope, a native of the south of Africa, nearly allied to the Bubblus (q. V.) of the north of Africa. It is the Harte-best of the Dutch colonists of the Cape of Good Hope, where it is the most common of all the large antelopes. Its horns are rather short and thick, curved like the sides of a lyre. It inhalts plans, and congregates in large herds. Its flesh is very good, more resembling beef than that of almost any other antelope. It is very capable of domestication.

KA'BA-NAGY, a small town of Hungary, situated in a plain 20 miles south-west of Debreczin. Pop. 6600.

KABYLES, another name for the Berbers (q. v.).

KATFA, a fortified town and scaport of South Russia, in the government of Taurida, is picturequely situated on the east coast of the Grimea, 70 miles east of Smiferopol, The harbour, a portion of the lay of K., an inlet of the Black Sea, is sleep and safe. It contains a citatel, a barracks, and a museum of antiquities chiefly collected in the vicinity; and although it has greatly declined, it is still the seat of considerable trade. The principal exports are wheat, hides, ascketcht, and goats' hair. In 1839, 213 vessels of 42,194 tons entered and cleared the port. Pop. 8309.

K., the ancient Theodosia or Feodosia, was in the 13th c., when it was under the Genoese dominon, the centre of trade. In 1465, it fell into the hands of the Turks, under whom it had 100,000 inhabitant. In 1783, it was taken by the Russians, to whom it was celed by the treaty of Jassy in 1792.

KAFFIR, or KAFIR, the name of a great family of the human race inhabiting the south part of the continent of Africa, classed by Dr Latham in division B of the variety Atlantide, their physical conformation being modified negro, and struggle of many months, the enemy was finally which also includes the Betjunans (µ, v), Ovampos, repulsed; and Sr H. Smith being relieved by Sir Damanns, and other similar turbes living in the H. Pottinger, and he by Sir George Grey, the physical conformation being mounted argue, and which also includes the Betjinans (n.y.), Ovannoos, Damaras, and other similar tribes living in the region south of 18° south latitude, and extending to the boundaries of the Cape Colony. By the term K., however, the tribes inhabiting the coastcountry on the east side of South-east Africa are generally understood, and recent events have further generally influenced and recent versions have a more particularly applying to the tribes living in the country between the Cape Colony and Natal, those east of the latter colony, as far north as Delagon, being now better known as Zulus or Zulu Kaffirs. being now better known as Zulus or Zulu Kamrs. Gendral distribution of the K. races: 1. Tribes (Amatabele, Amazulu, &c., north of Natal; Amam-pondo, Amaxosa,* &c., in Kaffraria Proper) speaking the Zulu language and its dialects, inhabiting the east-coast region; 2. Tribes (Makololo, north, and Bakuku, north-west of Lake Ngami; Bakalihari, &c.) speaking the Sichuana language and its diaact, speaking the Sicurana language and its dia-lects, inhabiting the central region, and known under the general name of Betjians; 3. Tribes (Ovampos and Damaras) speaking the Ovampo or Otjiherero and its dialects, inhabiting west-coast region.

History, dc.—The word K. is derived from the Arabic Kiajir, 'an unbeliever,' which was applied by the Mohammedan inhabitants of the east coast to the native tribes living south of them, and adopted by the Portuguese, after their settlements at Melinda and Mozambique, to designate the inhabitants of the vast region lying to the south, and extending to the country of the Hottentots, now

the Cape Colony.

The oldest genealogical records of the K. chiefs go back to 1617. In 1688, the old Dutch colonial records first mention the Kaffirs as having at that early period driven the Hottentot aborigines as far south as the Great Fish River; and in 1784, the latter was declared the boundary of the Cape Colony to the east. In 1798, commenced on series of K. wars, and between that and 1811 they were repeatedly attacked and driven across the Fish River. In 1819, under the leadership of a false prophet called Makanna, they ventured to attack Graham's Town, but were repulsed with great slaughter. A period of broken peace and ill-kept treaties then succeeded, during which time a con-siderable European and Hottentot population had been settled along the frontier (1820). In 1828, they were driven ont of the Kat River Valley, which was filled with Hottentot settlers; then came the great war of 1834—1835, which cost upwards of a million sterling, and ended in the Kaffirs being driven to the east of the Great Kei, and the territory between it and the Great Fish River was taken possession of by Sir B. Durban, but immediately restored by the then Colonial Secretary, Lord Glenelg. In 1846, war, which had been long inevitable, again broke ont, and the Gaika and Islambie Kaffirs, members of the great Amaxosa tribe, invaded the colony, and overran the whole of the frontier districts as far west as Uitenhage, and north to the Stormbergen, inflicting great and north to the Scornmergen, initioning general tools even on the imperial troops on many occasions. Again, under Sir H. Smith, they were in 1848 driven back, and the country they inhabited once

latter, by his wise and astute policy, succeeded in breaking up the power of the chiefs, dispersing the tribes amongst the European settlers, and utterly destroying their strength, in which he was not a little assisted by a terrible famine which about that period fell on the unfortunate people, they having neglected to plant their fields, and having killed nearly all their cattle, at the command of a false prophet called Umlangeni, whose influence the deluded chiefs used to urge their people to this last war. Since 1852, the principal actors in these great frontier contests, the well-known chiefs Macomo, Pato, Seyolo, &c., are miserable exiles and prisoners on a sandy islet in Table Bay, and another K. war appears to be a very remote contingency. A well-armed European population now occupies British Kaffraria, and the natives look for justice to local magistrates instead of to their former chiefs. Beyond the Kei River, the chiefs still rule, but their power is very much broken, as our frontier police control matters with a pretty high hand on both sides of the border.

The K. races are a tall, well-made, and generally handsome people, of a dark brown or bronze colour, and hair in short woolly tufts. As we proceed to and has in some wonly thus. As we proceed to the north, they gradually become more assimilated to the negro type, until at last the two races seem to blend together. They are brave, and in times of peace, kind and hospitable to strangers, affectionate husbands and fathers; and their minds have a peculiarly acute and logical turn, which in many of peculiarly acate and logical turn, which in many of our 'palavers' with them often gave them the hest of the argument. They are an honest people, except, perhaps, in the article cattle. Although their idea of God appears very indistinct, and their feelings of veneration but small, yet they are very super-stitious, and dread the influence of wizards and sorcerers. Their huts, which are built by the women, soreciets. Their mins, which are built by the women, are of a bee-hive shape, composed of wattles stretched with grass, and a collection of them is called a 'kraal,' a word of Portraguese origin signifying an enclosure. The general rule of the chiefs is patriarchal, they being assisted, however, by a number of 'pakati,' or councillors, whose advice is generally followed by the chief. Polygamy is allowed, and wires are generally purchased for cattle. The chief has absolute power over the property of his whole tribe, although he seldom exercises it. If any individual accumulates great wealth, an accusation of witcheraft is sure to make him disgorge it. They practise, in common with all other African nations, circumcision and many peculiar rites of purification, many of them analogous to those prescribed in the Mosaic law; hut these rites appear, both in Africa and Asia, to have been generally practised at an earlier period even than the Jews adopted them. The K. criminal code is very simple: a fine, great or small, of cattle pays for almost any offence, and the lex talionis is strictly forbidden even in case of murder. Many of their ceremonies and dances are of a very gross and obscene nature, although the K. women, especially after marriage, are very chaste and modest in their deportment, and present driven back, and the country they inhabited once classte and modest in their deportment, and present more annaced to the British crowa, under the title in this respect a striking contrast to the Hottento of British Kaffraria. Unfortunately, however, the race. The Kaffra are strictly a pastoral people, influence of the chiefs remained unbroken, and they and the men tead their herdis exclusively, even used it for evil by again invading the colony in 1851, and this time not only the Gaika tribes, but the labor of the Amaxosa and Amamtembu, besides a numerous body of rebel Hottentots, all well arrand, and provided with ammunition. Again, after a "The prefix Ama signifies tribe or family," the first prefix Ama signifies tribe or family, first prefix Ama signifies tribe or family,

chila, but the use of firearms is now prevalent amongst all the South-African tribes; and in the late war, the K. warriors, in skirmishing, excited the admiration of the light companies of some of our most distinguished regiments. The K. language is considered as a dialect of the Sichman, which is the original stock of the different tribes of the K. race. It is fine, sonorous, and expressive, with a most ingenious and complicated system of grammar. On the Cape frontier, inany Hotentot and Dutch words have been introduced; and in the Zula distect, the Weeleyam missionaries and Eishop Colerso of Natal have published many excellent African Israin, to checked the philology of South-African Israin, to checked the philology of South-African Israin, to checked the philology of South-African Israin, to the checked the

The Amalougu, or Fingues, are the remains of various Zulu tribes, refinges from the wars of Chaka, reduced to slavery by the Amaxona Kaffirs, and resemed by Sir B. Durban in 1835, and settled by him along the frontier of the Cape Colony. They are a saving, careful people, and many of them are converted to Christianity. They have always been our tirm allies against their hereditary enemies the Kaffirs, although of the same race and language. The Fingues are often, from their money-making propensities, called the Jews of the K. race. The Amanpondo, Amabaxa, and other tribes living near the Natal frontier, have never been at war with us, although often quarrelling amongst themselves: they are gradually declining in numbers, and are not near so fine a race as the frontier Kaffirs.

The number of the K. races has been estimated at three millions, scattered over an area of about a million square miles. Of these, there may be about 390,000 in Kaffraria Proper, 150,000 in British Kaffraria and Cape Colony, and 150,000 in Natal.

KAFFIR CORN. See DURRA.

KAFPRANRIA, PROFEE OF INDEFENDENT. The general designation of Kaffracia was fournerly applied to the whole of the coast region of South Africa cast of the Great Fish River, and extending as far north as Soldal, but it is now limited to a comparatively small region enclosed by the high and almost impossable mountain-chain called Kalambi, or Quathiamla, running parallel to the coast (see Carle nor Goom Hork and Africa) at a distant of about 20 miles from it between the cast frontier or almost 20 miles from it between the cast frontier area of about 25000 square miles, lying between the Great Kei and Unzinendurivers.

K. is drained by the Great Kei, the Umzimveobo or St John's River, and its fan-like branches, the Tystes and Tena, which rise in the Quathlands, the Umziment, Umtata, Umbasher, and several other atreams, with short courses, which rise in a high exception of the control of the course, which rise in a high exception of the course, which rise in a high case the course of the nonatinus at a height of about 2540 feet above the sea. The rivers, especially near the coast, run through deep-wooded khods, sunk below the level of the surrounding country, and none of them are navigable. The course generally is rocky and dangerous, and should not be approached closer than three unlies; anchorage may be found in one or two shallow bays east of the 8t. John's River.

K. is inhabited by the remains of the Amaxons and Amantenbu tribes of Katifrs (who, since the annexation of British Kaffraria, have retired across the Ker River), the once powerful tribes of the Annagaleka, Anamupoudos, and Amabaxa, besides the remains of many broken Zuiu tribes, refugees from the wars of Chaka and Dingaan, who have found shelter in that portion of the country that borders a Natal. The total number of natives may be

roughly estimated at 300,000; but it is probable in a very few years the whole region will be absorbed into the neighbouring colonies of British Kaffarnia and Natal, as the population is rapidly decreasing, and the chiefs fast losing their prestige and influence. The paramount chief is Bill, or Credit, of the Amagaleka tribe, who has his principal kraal about 20 miles east of the Green Kei Bilow.

east of the Great Kei River.

The soil of K. is fertile. The natives raise sufficient crops of Iadian and Katfir corn, pumpkins, &c., for their own use. Cotton has been successfully grown in many localities along the coast. Cattle, horzes, and goats thrive well, and a considerable trade with the adjacent colonies is carried on in hides, horns, goat-skins, tallow, and wagon-wool. The Wesleyan Sciecty have established many well organized stations, forming convenient haling places of the control of the control of the control of the trade with the control of the control of the control trade with the control of the control of the control of the trade of the control of the control of the control of the trade of the control of the control of the control of the trade of the control of the control of the control of the trade of the control of the control of the control of the trade of the control of the control of the control of the trade of the control of the control of the control of the control of the trade of the control of the trade of the control of the control of the control of the control of the trade of the control of the control of the control of the control of the trade of the control of the control of the control of the control of the trade of the control of the control

KAFPRARIA, BRITISH, a country of South Africa, between the Graat Kei, the White Kei, the Keiskamma, and Indian Ocean (wrested from the Kaffirs, by the Cape colonists in the war of 1846–1847), forms what is now the independent colony of British Kaffirmi. It has an area of 4309 square miles, and is bounded on the north by a high and pecturesque range of mountains called the Amatola (4000 to 5000 feet), a continuation of the Great Winterherg and Katherg ranges in the Cape Colony. It is well watered by the Keiskamma, Chunnie, Buffalo, Gonubi, and other minor streams or torrents, generally running in deep and rugged bels, and by the Great Kei, a considerable stream, dividing it from Independent Kaffraria. None of these rivers are navigable.

The physical aspect of British K, is similar to that of Lower Alkany, or the east-coast region of the Cape Colony. Many fertile, well-watered valleys are found amongst the spurs of the Amatola Monntains. Behind these mountains are high grassy plateaux, extending to the Kei River, and well adapted both for grazing and agriculture.

In 1859, Pritish K. was divided into farms of from 100 to 3000 acres, which were granted free on certain terms of settlement and defence; and it now contains a population of from 8000 to 10,000 souls of British and German descent, and probably 100,000 of the native races, Amasoss and Amafenge Kaffirs.

The principal town is King William's Town, the head-quarters of the military and seat of government, and containing a population of about 2500 souls. The port of British K. is East London, at the mouth of the Buffalo River, where there is good anchorage. There are numerous military posts and German villages extending along the line of the Buffalo from the sea to the mountains, and also several mission-stations, Episcopal, Wesleyan, Presbyterian, and German; and the natives are in numerous eases reclaimed from heathenism, and becoming an orderly and civilised population. In 1861, by her Majesty's letters-patent, British K. was declared an independent colony, under a lieutenantgovernor, the governor of the Cape being styled High Commissioner. Its revenues are derived from quit-rents of the farms granted, and the revenue duties collected at the port of East London, and are at present about sufficient to pay the expenses of the limited executive.

The larger fees nature have nearly disappeared, although a few years back the high plains morth of the Amatola, called the Bontelsak Flat, were the favourite hunting-grounds of South African sportsmen. A considerable number of the German Legion, sent here after the Crimean war, have received grants of land, and make excellent settlers, 3Two

English, and one or two German newspapers are published in King William's Town.

British Kaffraria, formerly a separate government, was incorporated with Cape Colony in 1866.

KAPIRISTA'N (i.e., country of the Kafirs or infidels), a country of Central Asia, on the south declivity of the Hindu Kush, forming part of the northern basin of the Cabul, in 35"—36 N. lat., and 69° 20'—71° 20' E. long.; area, 7000 square miles. The country is divided into narrow valleys by spurs of the Hindu Kush. The inhabitants, whose number is unknown, differ, as the name of the country implies, in creed and origin from the great body of the neighbouring tribes; in features and complexion, they claim kindred with Europeans. Their language, too, is said to be wholly independent of the other dialects of Central Asia. This state of isolation is mainly owing to the natural strength of the region, which, though repeatedly invaded, has never yet been subdued. The soil is fertile enough to render external intercourse comparatively unnecessary, yielding, as it does, fruits, wheat, and millet, and feeding large berds of cattle, sheep, and goats. Metals and timber likewise abound, the people working in the same with considerable skill.

KA'FTAN, an article of Turkish dress, resembling a dressing-gown, which is in use also amongst other

oriental nations.

KAIN, an old term in Scotch Law, used to denote rent paid in kind, as in the shape of poultry or animals, to a landlord. The word is said to be derived from conum, a Latinised form of the Gaelic

ceann, 'the head.'

KAIRWA'N, a decayed town of Northern Africa, in the state of Tunis, is situated 80 miles south of the town of that name, in a treeless, marshy plain.

It is surrounded by a brick wall, surmounted by four towers. It contains about 50 ecclesiastical structures, of which the Okbah Mosque, one of the most sacred of Islam, is compassed by a quadrangular wall, and contains numerous ancient pillars of marble, granite, and porphyry. The trade is chiefly in furs; saddlery and sandals are manufactured. Pop. 12,000.

KAISARIYEH. See CESAREA.

KAI'SERSLAUTERN, or LAUTERN, a small town of Rhenish Bavaria, is pleasantly situated on the Lauter, 25 miles north-west of Landau. Pop. 12,029.

KAKODYLE. See CACODYLE.

KALAMAZOO', a city of Michigan, United States, is situated in the south-west portion of the state, on the west bank of the river of the same name, 65 miles from its mouth, and 143 miles west of Detroit, on the Michigan Central Railway. It has a state lunatic asylum, a college for both sexes, ten churches, two newspapers, and several manufactories. Pop. in 1860, 6070.

KA'LBÉ, or CALBE, a town of Prussian Saxony, in the government of Magdeburg, is situated 18 miles south of the town of that name, on the left hank of the Saale. Spinning and weaving, with manufactures of paper, tobacco, and sugar, are here carried on. Pop. 6863.

KALE, or BORECOLE (Ger. Kohl), a cultivated variety of Brassica oleracea, differing from Cabbage in the open heads of leaves, which are used for callinary purposes as greens, and also as food for cattle. There are many sub-varieties, of which some are of a green, and others of a reddish-brown or purplish colour; some have the leaves comparatively plain, and others have them very much waved or curled, some also fringed or laciniated. Most of the

he reckoned perennial, as the Milan Kale (Chou de Milan), and are frequently propagated by cuttings, The kind called German Greens is one of the most delicate, and is very much cultivated in Britain. chiefly as a winter vegetable. The more the leaves are curled the more is it esteemed. The mode of its cultivation nearly agrees with that of cabbage.

KALE, SEA. See SEA KALE.

KALEI'DOSCOPE (from Gr. kalos, beautiful, eidos, image, and skopeo, I see), an optical instrument invented by Sir David Brewster in 1817. It consists of a tube, through whose whole length pass two mirrors or reflecting planes, which are hinged together along one edge, and make with each other an angle which is an aliquot part of 180°, whilst the one end is fitted up with an eyeglass, and the other is closed by two glasses, at a small distance from each other, between which are placed little frag-ments of glass or other variously coloured objects. The eye looking into the tube now perceives these objects multiplied as many times as the angle which the reflecting planes make with each other is con-tained in the whole circumference of a circle, and always symmetrically disposed; and the slightest shaking of the instrument produces new figures. There are various modifications of the kaleidoscope, by some of which its power is much increased; and it is not only a pleasing toy, but of great use to pattern-drawers and others, to whom it supplies endless varieties of figures.

KALENDAR, See CALENDAR,

KALENDS. See CALENDS.

KALEWALA. See FINNISH LITERATURE.

KALGUEF, or KOLGUEV, an island of Russia, in the Arctic Ocean, 240 miles in circumference, belongs to the government of Archangel, and is situated 115 miles east of the northern extremity of the peninsula of Kauin. It is the resort of innumerable flocks of wild-fowl, especially eider-ducks, geese, and swans, which are caught in great numbers by the fowlers who visit the island every summer.

KALIDASA, the greatest dramatist, and one of KARIDASA, the greatest dramatist, and one of the most celebrated poets of India. He is known to the literary public of Europe especially through his drama S'akumtala, which, first introduced to the notice of the western world by Sir William Jones (1789), created so great a sensation throughout Europe, that the early success obtained by Sanscrit studies in England and Germany may be considered due to this master-piece of Sanscrit literature. Another drama of the same poet, and next in renown to S'akuntala, is the Vikramorvas'i, or the Hero and the Nymph. Besides these works, Hindu tradition ascribes to his authorship a third drama and several poems, which no European critic will believe could ever have sprung from a mind like that of Kalidasa. Professor Lassen, in the Indische Alterthumskunde, passes the following judgment on this poet: 'Kâlidasa may be considered as the brightest star in the firmament of Hindu artificial poetry. He descrives this praise on account of the mastery with which he wields the language, and on account of the consummate tact with which he imparts to it a more simple or more artificial form, according to the requirements of the subject treated by him, without falling into the artificial diction of later poets, or overstepping the limits of good taste; on account of the variety of his creations, his ingenious conceptions, and his happy choice of subjects; and not less on account of the complete manner in which he attains his poetical ends, the beauty of his narrative, the delicacy of his sentiment, and the fertility of his imagination.' But although we are enabled by kinds are biennial, like the cabbage, but some may his works to appreciate the merits of this poet,

we know little of his personal history. That he lived at Ujayini of Oujein, and that he was 'one of the nine geme of the court of Vikramāditya,' is all that is related in regard to him. But as there have been several Vikramādityas at Ujayini, his date is su uncertain as that of any personage of the ancient history of India. Dr Bhão Dáji, in a learned and ingenious cssay 'On the Sansert Poet, Khildhaa' (Journal of the Bombay Brunch of the Royal As. Soc., October 1800), his endeavoured to identify Vikramāditya, the contemporary of K., with Harsha Vikramāditya, and that the great poet would therefore have lived in the middle of the 6th c. of the Christian era.

KALIHA'RI DESERT. The Kalihari is a vast central and nearly uninhabited tract of country lying between Great Namaqualand and the Betjouana country, in South Africa, extending from the northern banks of the Gariep or Orange River to the latitude of 21' south, or the verge of the Ngami region, a distance of nearly 600 miles, with an average breadth of about 350 miles, and presenting some curious physical features quite distinct from other desert regions of the globe. It is a nearly waterless, sandy, but in many places well wooded region, on which rain seldom falls, intersected by dry watercourses, with a substratum of a tufaceous limestone, and to all appearance formerly the bed of an immense lake. Livingstone considers it remarkable for little water and considerable vegetation, and therefore very different from the karroos of the Cane Colony, which have neither water nor vegetation except after heavy rains, and from the bare and sandy deserts of North Africa and Arabia mountains or elevations of any considerable height are found in the Kalihari, the general level of which may be considered as 3000 feet above the sea. The few springs or 'sucking-places' which here and there are found are generally carefully concealed by the Bakillhari, a miserable wandering race of Betjouana Bushuen, who roam through the desert in quest of game, of the skins of which they make the fur-robes called 'carosses.' The Kalihari has been crossed by C. J. Andersson and others, near its outskirts; but of its central parts very little is known. After heavy rains, immense herds of clephants, rhinoceroses, and giraffes are found in its dense thickets, and feed on the succedent wild melons called 'Kengwe,' which then abound there. In the north part, are immense forests of thorn-

KA'LISZ, a town of Poland, on the Prosna, in the government of Warsaw, 136 miles west-southwest of the city of that name. It is one of the oldest Polish towns, and was formerly the capital of a palatmate. Population 12,253, who carry on an extensive trade. The alpioning county is the best coltivated in the kingdom. Two famous Lattles were fought here—the first between the Poles and Russians and the Swedes in 1706; the other between the Russians and Saxons in 1813.

KALIYUGA, in Hindu chromology, the fourth or last of the periods contained in a Malayuga or great Yuga (q. v.). It may be compared to the Iron Age of classical mythology. It comists, according to native imagination, of 432,000 solar-sidereal years, and begins 3102 years before the Christian cra. The relation of the four Yugas being marked by a successive physical and moral decrement of created beings, the Knityuga is the worst of all. 'In the Krita (or first age,' Manu says, 'the (geniss of) Trath and Right (in the form of a bull) stands firm on his four feet, nor does any advantage accrue to men from iniquity. But in the following ages, by reason of mijust gains, he is deprived anecessively

of one fost; and even just emoluments, through the prevalence of theif, falsehood, and fraud, are gradually diminished by one foot (i. e., by a fourth part). The estimate in which this Kaliyuga, our present age, is held by the modern Hindus may be gathered from one of their most celebrated Purknas, the Padma-Purkna. In the last chapter of the Krjalyoga-fran of this Purkna, the following account is given of it: 'In the Kaliyuga, (the genius of) light will have but one foot; every one will delight in evil. The four castes will be devoted to wicked for them. The Ferhamas will neglect the Velas, hanker after presents, be hustful and crude. They will despise the scriptures, gamble, steal, and desire intercourse with wildows. For the sake of a livelihood, some Brahmans will become arrant regues.

. The Sudras will endeavour to lead the life of the Brahmans; and out of friendship, people will bear false witness they will injure the wives of others, and their speech will be that of falsehood, Greedy of the wealth of others, they will entertain a guest according to the behest of the scriptures. but afterwards kill him out of covetousness; they are indeed worthy of hell. The twice-born (i.e., the first three eastes) will live upon debts, sell the produce of cows, and even their daughters. In this Yuga, men will be under the sway of women, and women will be excessively fielde. . . . In the Kaliyuga, the earth will bear but little corn; the clouds will shed but little rain, and that, too, out of season. The cows will feed on ordure, and give little milk, and the milk will yield no butter; there is no doubt of that. . . . Trees, even, will wither in twelve years, and the age of mankind will not exceed sixteen years; people, moreover, will become gray-haired in their youth; women will bear children in their fifth or sixth year, and men will become troubled with a great number of children. In the Kaliyuga, the become kings, bent upon evil; and those living in foreign countries will be all of one easte, and out of lust take to themselves many wives. first twilight of the Kaliyuga, people will disregard Vishn'u : and in the middle of it, no one will even mention his name.

KALMAR, a town and scaport on the south-cast coast of Nevelen, cayated of a hen of the same name, is situated on the Kalmar Sound, opposite the island of Uland, and about 200 miles south-south-west of Stockholm. It has a good harbour, a handsome cathedral, and a large and beautiful castle, in which, on the 12th July 1397, the treaty called the 'Union three northern kingdoms upon Queen Margaret of Demnark and her heirs for ever, was agreed to by the departies of the three kingdoms, The union, nevertheless, lasted only till the death of Margaret (see DESMARR, HISTORY or). The commerce of the town is considerable, and manufactures of sugar and tobacco are carried on. Pop. 7534.

KALMIA, a genus of plants of the natural order Ericor, consisting of evergreen shrules, mostly about two or three feet high, natives of North America, with red, pink, or white flowers, generally in coryunbs. The flowers are very delicate and beautiful, and the corolla is in the shape of a wide and shallow led!. Some of the species are frequent ornaments of gardens in Britan. They delight in a peatsoil. K. hatifolia, the MOUNTAIN LATER, or CALICO BERM ON FORTH America, coequies large tracts on the Alleghany Mountains. It grows to the height of ten feet, and the wood is very hard. It is narrotic and dangerous; the leaves are p-eisonous to many animals, and the honcy of the flowers possesses noxious with advantage in cutaneous diseases.

KA'LMUCKS, or, as they call themselves, the Derben-Ueirat (the Four Relatives), and also designated by the name of Eleutes and Khalimik (Apostates), are the most numerous and celebrated of the Mongol nations. They are divided into four tribes, the first of which, the Khoskóts (Warriors), number nearly 60,000 families, and inhabit the country around the Koko-nur, which they consider the native country of the race. One portion of this tribe migrated to the banks of the Irtisch, and became subsequently incorporated with the second tribe, the Dzangars; another portion mi-grated to the banks of the Volga, in the 17th c., and is found at the present day in the government of Astrakhan. The second tribe are the *Dzūngars*, who give the name to a large territory (Dzungaria) in the west of Chinese Tartary; at the present day they number about 20,000 families. The third tribe are the Derbets or Tchoros, who deserted Dzûngaria, and finally, to the number of 15,000 families, removed a few years ago to the plains of the Ili and the Don, where they are being rapidly incorporated with the Don Cossacks. The fourth great tribe of the K. are the Torgots, who, about 1660, separated from the Dzungars, and settled in the plains of the Volga, whence they were called the K. of the Volga; but finding the Russian rule too severe, the majority returned to Dzûngaria.

No Mongol or Turkish race presents such charac-teristic traits as the K.; indeed, they answer exactly to the description given of them by Jornandes 13 centuries ago, when, under the name of Huns, they devastated Southern Europe. The Kalmuck is short the statted Southern Europe. The Raimier's source in stature, with broad shoulders, and a large head; has small black eyes, always appearing to be half-shut, and slanting downwards towards the nose, which is flat, with wide nostrils; the hair is black, coarse, and straight, and the complexion deeply swarthy. The Kalmuck is considered to be the original type of the Mongol and Mancha races, and his ugliness is the index of the purity of his descept. They are a nomad, predatory, and warlike race, and pass the greater part of their lives in the saddle. Their usual food is barley-flour soaked with water, and their drink is the 'koumiss' (made from fermented mare's milk). In 1829, Russia established a Kalmuck institute for the training of interpreters and government officials for the K. of Russia, and she has since been making great efforts to introduce civilisation among them. Many still retain their native Buddhism.

KALO'CSA, a town of Hungary, near the left bank of the Danube, about 70 miles south of Pesth. It contains a fortified bishop's palace, with a library of 30,000 volumes. K. is a steam-packet station on the Danube, and contains a population of 11,400.

KALONG, a name originally Javanese, and belonging to one or more species of frugivorous Bat (q. v.) inhabiting Java, hut now frequently applied to all the frugivorous bats, the family Pteropidae, or at least to all the species of the genus Pteropus. The Pteropide are all large bats, and some of them are the largest of all the Cheiroptera. They are called Roussette by French naturalists, and often, popularly, FLYING FOX by Europeans in the East. They are found in the East Indies, Japan, Australia, Africa, and South America. There are many species. Their food consists chiefly of soft fruits, as bananas, figs, &c. The Javanese K. (Pteropus Javanicus) measures about 5½ feet in expanse of wing. The principal allituent of the Volga, rises in the govern-head and body are more than a foot long. It is ment of Viatka, and after a south-west course of gregarions, and during the day, great numbers may 1100 miles, joins the Volga in the government of be seen hanging by their hinder claws, motionless | Kasan, 50 miles above the town of that name. Its

properties. A decection of the leaves has been used and silent, on the branches of trees which they have selected for their abode. The body is covered with fur of a reddish-brown colour. This and the other true Pteropi have no tail, and a smaller number of vertebre—24 in all—than any other manumalia. Some of the Pteropide have a very short tail. The flesh of some of them is eaten, and one, inhabiting the Moluceas and Isles of Sunda, has been called the Eatable Kalong (P. edulis). It is said to be white and delicate. Some of the species are migratory.

KALPA, in Hindu Chronology, a day and night RADPA, in Thum Caronology, a day and mem of Brahma, which, according to some, is a period of 4,320,000,000 solar-sidereal years, or years of mortals, measuring the duration of the world, and as many, the interval of its annihilation. The Bhavishya-Purafua admits of an infinity of kalpas; other Puranas enumerate thirty. A great kalpa comprises not a day, but a life of Brahma.—In Vedic literature, kalpa is a Vedânga. See Kalpa-Sûtra.

KALPA-SÛTRA is, in Vedic Literature, the name of those Sanscrit works which treat of the ceremonial referring to the performance of a Vedic sacriice. See Veda.—In Jaina Literature, it is the name of the most sacred religious work of the Jainas. See Jainas. It is chiefly occupied with the legendary history of Mahavîra, the last of their 24 defied saints, or Tirthankaras, but contains also au account of other four saints of the same class. The name of the author was Bhadra Bâhu, and the work was composed, as Stevenson assumes, in the year 411 was composed, as Stevenson assumes, in the year 411 of the Christian era; but the conjecture of another writer places it 632 after Christ. It is held in so high respect with the Jainas, that, of the eight days in the middle of the rains which are devoted to the reading of those works esteemed peculiarly sacred, no less than five are allotted to the Kalpa-Sûtra.' Stevenson, The Kalpa-Sûtra and Nava Taiva (Lond.

KALU'GA, a government of Russia, lies immediately south-east of that of Smolensk. Area, 11,780 sq. miles; pop. in 1864, 964,796. The surface is flat; the soil, stony, sandy, and only moderately fertile. More than half of the province is under forest. It is watered by numerous rivers, the chief of which is the Oka. The principal occupation of the inhabitis the Ora. The principal occupation of the innabitants is the cultivation of hemp. Sailcloth, which is not only sent to the ports of Russia and Europe, but also largely exported to America, is the chief article of manufacture. Coloured cloths for the China trade are also made. The government of K. is divided into eleven districts

KALUGA, chief town of the government of the same name, is situated on the right bank of the Oka, in lat. 54° 31' N., long. 36° 20' E. From the 14th to the 18th c., its stronghold was a great protection against the invasions of the Lithuanians, the Tartars of the Great Horde, and especially against the Crimean Tartars. Situated in the centre against the trimean tartars. Situated in the centre of the empire and on a navigable river, it carries on an extensive corn-trade, the corn being sent down the Oka to Nijni-Novgrood, and thence up the Volga, the Volga canals, and the Neva, to St Petersburg and the Baltie ports. The value of this branch of trade is 22,000,000 rables (\$2,500,000). There are several leather and other factories in the town. Pop. 34,668. K. has for many years been a place of banishment for political offenders; and is at present the residence of Schamyl, the Circassian

KA'MA, a navigable river of European Russia, the

chief tributaries are the Viatka, the Tchoussovaia, and the Bielaia. This river is navigable 40 miles below its source, and the navigation commences in the beginning of May. The annual value of the goods conveyed on the K is estimated at £8,000,000. The river abounds in fish, especially salmon.

KAMA, or KAMADEVA, the Hindu god of Love, and one of the most pleasing creations of Hundu fiction. In Sanserit poetry, especially that of a later period, he is the favourite theme of descriptions and allusions; and mythology exalts his power so much that it allows even the god Brahna to succumb to it. According to some Puranas, he was originally a son of Brahma; according to others, a son of Diurma (the genius of Virtue), by Sraddhá (the genius of Faith), herself a daughter of Daksha, who was one of the mind-born sons of Brahma. The god Siva being on one occasion greatly incensed at K., reduced him to ashes; but ultimately, moved by the affliction of Rati (Voluptuousuess) the wife of K., he promised her that her husband should be reborn as a son of Krishna. The god Krishna, accordingly, having married Rukmint, she bore him Pradyumna, who was the god of Love. But when the infant was six days old, it was stolen from the lying-in chamber by the terrible demon S'ambara : for the latter foreknew that Pradyumna, if he lived, would be his destroyer. The boy was thrown into the ocean, and swallowed by a large tish. Yet he did not die : for that fish was eanght by fishermen, and delivered to Mayacatt, the mistress of S'ambara's household; and when it was ent open, the child was taken from it. Whilst Mayavati wondered who this could be, the divine sage, Narada, satisfied her curiosity, and counselled her to rear tenderly this offspring of Krishna. She acted as he advised her; and when Pradyumna grew up, and learned his own history, he slew the demon S'ambara. Mayavatt, however, was later apprised by Kr'ishna that she was not the wife of Sambara, as she had fancied herself to be, but that of Pradyumna-in fact, another form of Rati, who was the wife of K. in his prior existence, -K. is described or represented as holding in his hands a bow made of sugarcane, and strung with bees, besides five arrows, each tipped with the blossom of a flower which is supposed to conquer one of the senses. His standard is, agreeably to the legend above mentioned, a fabulous fish, called Makara; and he rides on a parrot or sparrow—the symbol of voluptuousness. His epithets are numerous, but easily accounted for from the eireumstances named, and from the effects of love on the mind and senses. Thus, he is called of love on the mind and senses. Thus, he is called Makradhoopi, 'the one who has Makara in his banner;' Mada, 'the maddener,' &e. His wife, as before stated, is Rati; she is also called Kāmakalā, 'a portion of Kāma,' or Priti, 'allection.' His daughter is Trishā, 'thirst or desire;' and his son is Aniruddha, 'the unrestrained.'

KAMINETZ-PODOUSK, or PODOJSK, a town of West Russia, capital of the government of Podolia, is picture-squely situated near the Austrian frontier, on a steep rock above the river Smortizza, an afflient of the Dimester. Its foundation dates from the carriest times. Pop. 19,579. The most root the carriest times. Pop. 19,579. The most the Dominiona Church. The delications, which were razed in Bil2, lawe been renewed. K. was, before the partition of Poland, the strongest bulwark of that country against the Tarks.

KAMPEN, one of the prettiest towns of the Netherlands, in the province of Overyssel, is situated near the mouth of the Yssel, in the Zuyder Zee. Here a bridge 790 feet long, and upwards of 20 feet broad, extends across the river. Though formerly of greater importance, it still carries on a considerable general trade. 1'op. 12,316.

KAMPTU'LICON, the name given to a newly invented floor-cloth, which is said to be mide of india-rubber and eork; much of it, however, consists of oxidised linseed oil and cork. The cork is reduced to a state resembling very fine sawdust, and kneaded up with the real caoutchouc, or with the artificial kind made of oxidised linseed oil. the whole being kept very soft by heat. The mass is then made into sheets by passing through cylinder rollers heated with steam, The sheets, when cold, are ready for use, when no ornamental surface is required; but very excellent designs may be painted upon it, the same as upon ordinary flooreloth. Kamptulicon, notwithstanding the ease with which it is made, is more expensive than the floor-cloth made by painting hempen or linen fabrics; it has, however, qualities which render it very valuable for special purposes; its clasticity to the tread not only makes it agreeable to walk on, but it is noiseless, and is consequently well adapted for hospital passages and other positions in which quiet is desirable; it is also impervious to damp, and thereby well suited to damp stone floors where other fabries would soon decay.

KAMTCHA'TKA, PENINSULA OF, forms the south-east extremity of Siberia, from which it stretches southward, extending in lat. between 51° and 60° N., and in long between 155° 40' and 164° 20' E. It is 725 miles long, and averages 190 miles in breadth. A chain of volcanie mountains traverses the centre of the peninsula, and gives rise to the rivers, of which the Kamtchatka is 150 miles in length. There are about 14 volcanoes in the peninsula, the most remarkable of which-the volcano of Plutchevsky-is 16,000 feet high. This mountain now only emits smoke and embers; but in former times, eruptions used to take place every seven or eight years. The soil, in general, is stony; but there are many tracts of mountain-slope which are arable. Agriculture, however, is much hindered by untimely frosts, periodical rains, and sometimes by multitudes of mice and rats. The bread required by the inhabitants of the fortresses of Petropaulovsk and Tagil is supplied from Okhotsk. The principal occupations of the inhabitants are fishing and The most valuable domestic animal is a hunting. The most valuable domestic animal is a peculiar kind of dog which never barks. K. was annexed to Russia at the end of the 17th c., after the expedition of the Cossack chief Atlasof, Pop. 10,000, made up of Kamtchadales, Kourdetri, Omototzi, and Russians. The Kamtchadales - the preponderating race of the inhabitants-live mostly in the south. They are small in stature, with a large head, broad face, black hair, small eyes, broad shoulders, and hanging lips and stomach. Formerly, they lived in tents made of branches; they now dwell in huts. They have nominally embraced Christianity, but retain much of their savage nature and superstitions. Nijni-Kamtchatsk, the chief town of the government, is situated on the river Kamtehatka. The fort of Petropaulovsk, with a fine harbour covered with ice only during a brief period of the year, is most picturesquely situated, and enjoys a healthful climate,

KAMYSHIN, a tawn of Russia, in the government of Saratov, 120 miles below the town of that name, on the right bank of the Volgs, lat. 50° 5° N., long, 45° 25° E. It possesses about 7500 inhabitants, who carry on a considerable trade in corn.

KANAGA'WA, a town of Japan, and the shipping port of Yeldo. It was opened (together with Hakodadi and Nagasaki) to British subjects on the 1st July 1859 by the treaty of August 1858, 769 It is situated on the northern edge of a bight on the western side of the great bay of Yeddo, and about 16 miles from that city. Here is located the official section of the small foreign community which, through the manœuvres of the Japanese, has been established—not at K, but at Yckohama on the opposite point of the bay. K. has a larger foreign trule than any other port of Japan. In 1868, 2855 vessels, of 304,241 tons, entered, and 365, of 289, 3655 vessels, of 504,241 tons, entered, and 365, of 289, of the latter belonged to the U. States. The value of exports from K, to the U. States, during 186S, was 83,863,208.

KANARIS, KONSTANTIN, a native of the isle of Ipsara, distinguished for his exploits in the Grecian war of independence, and particularly for the destruction of Turkish vessels by fireships. He was master of a small merchant-vessel before the commencement of the war. In 1822, he blew up the Turkish admiral's ship in the Strait of Chios, and thus avenged the cruelties which the Turks had perpetrated on the Greeks in that island. November of the same year, he burned the Turkish admiral's ship in the harbour of Tenedos. His native isle of Ipsara having been ravaged, he took revenge, on 17th August 1824, by burning a large Turkish frigate and some transport-ships which were carrying troops to Samos, and thereby saved Samos from the calamity which Chios and Ipsara had endured. In 1825, he formed the hold design and endured. In 1825, he formed the host design of burning the Egyptian fleet in the harbour of Alexandria, where it lay ready to carry troops to the Peloponnesus, and it appears that only an unfavourable wind springing up prevented his success. He was appointed to important commands by the Greek president, Capo D'Istrias, and in 1848 and 1849 was war minister of Greece, and president of the cabinet. Recently (1862), as admiral of the fleet, he took part in the revolution which overthrew the government of King Otho.

KANAWHA, GREAT. See GREAT KANAWHA. KANDAVU, one of the Fiji Islands (q. v.).

KANE, Sir Robert, M.D., a celebrated chemist, was born in Dubhin in 1810. He was educated for the medical profession, and in 1832 was received as a member of the Royal Drish Academy, and in the same year projected the Dublia Journal of Medical Science, which at first treated only of chemical and pharmical subjects. In 1840, he received the gold metal of the Royal Society of London for his researches into the colouring matter of lichens. From 1844 till 1847, K. was Professor of Natural Philosophy to the Royal Dublin Society, and in the last-mentioned year received the Cunningham Gold Medal of the Royal Dublin Society, and in the Museum of Industry in Ireland, was appointed its Mirst director, and the same year received from the Lord-Ineutenant the honour of knighthood. At present (1870), he holds the office of President of the Chemistry. In Ireland, was exposured in the Contract of the Chemistry (1841—1842, 1849), as work of wieldy acknowledged merit; Industrial Resources of Ireland (1844), being the substance of a becture delivered in the previous year, and published at the expense of the Royal Society of Dublin.

KANE, ELISIA KSPT, M.D., a celebrated Arctic explorer, was born in Philadelphia, United States, February 3, 1820, entered Virginia University in 1830, afterwards studied medicine, and entered in 1711. It is of a grayish-brown colour, the fur the navy as a surgeon, in which capacity he visited distinct and the first of absence, Arabia, Egypt, Greece, and Western Land. It sometimes attains the weight of 160 has, Europe. Soon after returning home, he was ordered or upwards. Its flesh is highly esteemed, and it is

to the west coast of Africa in May 1846, but being attacked by fever, was compelled to return in the following April. He was then transferred to the military staff, and served in Mexico. In May 1850, he commenced his career of Arctic discovery as surgeon, naturalist, and historian to the first Grinnell expedition. In the spring of 1853, he was again sent out, this time as commander of a second Grinnell expedition, in which he achieved important results. These results are fully detailed in his Second Grinnell Expedition in Search of Sir John Franklin (2 vols. Philadelphia, 1856). On his return, in the autumn of 1853, honours were showered on the fortunate adventurer; he received gold medials from the Queen of Great Britain, the Royal Geographical Society of London, the American Congress, and the New York Legislature; but his health, which had been preceives since 1844, was rapidly failing, and after a visit to London, where he died on February 16, 1857. He life has been written by W. Elder, M.D. (8vo, Philadelphia, 1857).

KANGAROO' (Macropus), a genus of marsupial quadrupeds, of which there are many species, almost all Australian, although a few are found in New Guinea and neighbouring islands. The genus, which some naturalists subdivide, is the type of a family Macropida, including also the Kangaroo-rats or Potoroos (q. v.), which have canine teeth in the upper jaw, whilst the kangaroos have no canine teeth, and in their dentitiou generally, and in their digestive system, make a nearer approach than any other marsupial quadrupeds to the ruminants; the potoroos, on the other hand, approaching the rodent type. Kangaroos are said sometimes to ruminate. The stomach of kangaroos is large, and is formed of two elongated sacs. They are entirely herbivorous. The Macropide are all characterised by great length of the hind-legs, whilst the fore-legs are small; but the radius allows a complete rotation of the fore-arm; and they make use of the fore-feet as organs of prehension, and for many purposes, with great adroitness. The fore-feet have five toes, each armed with a strong curved nail; the hind-feet have four toes—one very large central toe, with a very large solid nail. The hind-feet are very long, through an extraordinary elongation of the metatarsal bones. The tail is very long thick, strong, and tapering, and is of great use in balancing the animal in its leaps, and also for sustaining the body in its ordinary erect sitting posture, in which it uses the hind-legs and the root of the tail as a tripod. In this posture, also, it usually walks by the hind-legs alone. The head is in form somewhat like that of a deer; the ears moderately large, and oval; the eyes large, and the aspect mild.

The GREAT K. (M. giganteus) is generally about

The Great K. [M. giyanteug] is generally about 1/2 feet in length from the nose to the tip of the tail, the tail being rather more than three feet in length, and fully a foot in circumference at the base. The height of the animal is rather more than fifty inches, in the erect stifting posture already mentioned, but it sometimes raises itself on its toes to look around it, and its height is then greater than that of a man. The Woollty K. or RED K. [M. loning»] rather exceeds it in size. The Great K. was first discovered in Cook's first voyage, 22d June 1770, and until that time it may almost be said that kangaroos were unknown to Europeans, although a New Onimer Section 1. Let Brown 1. The Section of the Section 1. Let Brown 1. The Section 1. The Section 1. The section of the

much sought after by the colonists, so that it is now rare in regions where it was once abundant. It is not properly gregarious. The kangaroos are all timid animals, making their escape from their pursuers by extraordinary leaps. The Great K. often

Great Kangaron (Macropus giganteus)

proves too swift for greyhounds. When driven to bay, it sometimes kills a dog by a single stroke of its hind-leg, the great nail ripping him open at once. Some of the kangaroos inhabit open plains, some are more generally found in forests, some are frequent on the snowy summits of the highest Australian They are of very various size; some mountains. are not much larger than a rabbit. They are easily tamed; some species have been brought to Britain, and have bred in zoological collections, but have not yet been properly naturalised.

The exceedingly immature state in which young kangaroos are born, and the manner in which they are nourished, fall to be noticed in the article MAR-SUPIATA. Ere they finally desert the pouch of the mother, the young may be seen poking their heads out of it, and nibbling the herbage among which

she moves.

KANGAROO GRASS (Anthistiria australis), the most esteemed fodder-grass of Australia. grows to a height much above that of the foldergrasses of Britain, affords abundant herbage, and is much relished by cattle. The genus is allied to Andropoyon, and has clusters of flowers with an involucre. The awns are very long and twisted, both in the K. G. and in a nearly allied species, A. ciliata, which is one of the most esteemed fodder-grasses of India.

KANO, a great manufacturing and mercantile town and capital of a province of the same name, in the empire of Sokoto, Central Africa, stands in lat. 12° 2' N., and long. 8° 22' E. The province is estimated to contain 500,000 inhabitants, and from its beauty and wealth, has been called the 'Garden of Central Africa.' The wall which surrounds the town of K. is 15 miles in circuit, and between it and the town, which is circular in shape, and is about three miles in diameter, a space intervenes large enough to supply the inhabitants with corn in case of siege. The houses are built of clay, covered for the most part with conical thatched roofs. The industry consists chiefly in the weaving and dyeing of cotton cloths, which are exported from K. to the value of £30,000 annually, to Timbaktu and to Tripoli over Bornu.

KANSAS, one of the United States of America, lying between lat, 37° and 40° N., and long, 94° 40' and 102° W. It is bounded on the N. by Nebraska, E. by Missouri, S. by Indian Territory, and W. by Colorado, having a breadth of 208, and an extreme length of 408, miles, and containing 81,318 sq. miles or 52,043,520 acres, 21,120,000 of which remained unsurveyed in 1869. Three-fourths of this aren is esteemed adapted to agriculture, one-fifth is both agricultural and mineral, and nearly 2,000,000 acres are strictly mineral lands. Coul and iron are the principal minerals, no precious metals or copper having been found. The grazing lands, are principally west of the 99th degree of W. longitude, and cover an area of 13,066,000 acres. No mountain-ranges or swamps exist in K., but the land rises in bluffs and rolling prairies. The timbered lands lie principally along the streams, but even the dry portions, now destirate of trees, are susceptible of reclamation by planting and irrigation. Under the supervision of R. S. Elliot, Industrial Agent of the Kansas Pacific R. R., efforts for the redemption of the arid plains once called the 'Great American Desert' appear to be highly promising. Already the climate is believed to have changed, and the rains are increasing yearly ; but that this is due to cultivation and forest-planting is not yet fully ascertained. The climate experiences extremes of heat and cold, but is generally healthy. During the year 1869 the crops yielded most abundantly. Immense beds of iron have been discovered in the northern part. Lignite and a superior coal are abundant, and marble, kaolin, and sult have been found. Education is in a flourishing state, and there are 1707 schools, with 48,007 pupils, a state university, agricultural college, normal school, blind and deaf and dumb asylums, and 9 colleges sustained by religious denominations. The prairies abound in game, the rivers with fish. In 1870 there were 1500 miles of railroad open to traffic, and 2197 more projected. Topeka, on the Kansas river, is the present K. was organised as a territory in 1854, and became the scene of violent contests between northern and southern settlers, on the question of slavery. Organised and armed parties of emigrants were sent from the free states, and armed bands invaded it from Missouri. A civil war broke out between these parties, both of whom formed state constitutions in 1856. After much violence on both sides, a constitution was adopted in 1859, excluding slavery, and K. was admitted into the Union, January 29, 1861. Pop. 1860, 107,206; 1870, 361,089.

KAN-SU', the most north-western province of China, is bounded on the E. by Shen-se, on the S. by Thibet and Se-Chuen. Area estimated at from 80,000 to 100,000 square miles; pop. at 16,000,000. Its surface is mountainous; chief river the Hoang-ho. Lan-chow is the capital, and there are six other cities of the first rank.

KANT, IMMANUEL, one of the greatest and most influential metaphysicians of all time, was the son of a saddler, of Scotch descent, and was born at Königsberg, 22d April 1724. He was educated at the university of his native town, and after spending some years as a private tutor, took his degree at Königsberg, in 1755, and began to deliver prefections on logic, metaphysics, natural philosophy, and mathematics. In 1762, he was offered, but declined the chair of poetry, and in 1770, he was appointed professor of logic and metaphysics. He died 12th February 1804. K.'s private life was uneventful, yet curious and almost ludicrous in its mechanical regularity. As Socrates could hardly be induced to go beyond the walls of Athens, so K. clung with ovster-like tenneity to the city of his birth, never leaving it during the thirty years of his professorship.

He remained a bachelor all his life. K. was a man of unimpeachable veracity and honour, austere even in his principles of morality, though kindly and courteous in manner, a bold and fearless advocate of political liberty, and a firm believer in human progress. The investigations by which he achieved the reputation of a reformer in philosophy, refer not so much to particular sections or problems of that science, as to its principles and limits.

The central point of his system is found in the proposition, that before anything can be determined concerning the objects of cognition, the faculty of cognition itself, and the sources of knowledge lying therein, must be subjected to a critical examination. Locke's psychology, indeed, at an earlier period in Locke's psychology, indeed, at an earlier period in European specimition, had shewn a similar tendency; but before K., no thinker had definitely grasped the conception of a critical philosophy, and K. himself was led to it not so much by Locke, as by Hume's acute scepticism in regard to the objective validity of our ideas, especially of the very important idea. of our ideas, especially of the very important near of causality. The Kantian criticism had a twofold aim: 1st, to separate the necessary and universal in cognition from the merely empirical (i. e., from the knowledge we derive through the senses); 2d, to determine the limits of cognition.

In regard to the former of these, it is of importance to observe, that K. did not subject the old psychological doctrine of 'faculties' to any analysis, but attributed to each of these—viz, to the faculties but attributed to each of these—viz., to the faculties of Sense, Understanding, Judgment, and Reason—certain innate à priori forms, conceptions, and functions, which, as constituting the necessary condifficions, which, as consistently der increased, on account of their subjective necessity, a universal subjective validity. Thus, in the Sense, as the faculty receptive of external impressions, there must lie, according to K., the forms of Space and Time; in the Understanding, as the faculty by which the manifold in appearance is combined in the unity of conception, the Categories; in the Reason, as the faculty of principles, the Ideas of the Unconditioned and the Absolute; in the Judgment, in as far as it is not merely subsumtive, but also reflective, the conception of Design or Conformity to the purpose in view; finally, in the Will or the Practical Reason, the Categorical Imperative of

the Moral Law.

In regard to the latter aim of the Kantian criti-In regard to the latter am of the Rantian critical exists—viz, to determine the limits of theoretical knowledge—the efforts of K. go to shew that universal forms existent a priori in the human mind, can afford knowledge only under the condition that the objects which they cognize are presented by which they cognize are presented by the control of the condition empty forms, by which something indeed is thought, but nothing known. Even within the limits of Experience itself, we are cognizant, according to K., through the forme of the Sense and of the Understanding, not of things as they are in themselves, but only as they appear; hence the opposition between noumena and phanomena. But when we try to transcend those limits, and to ascertain the intelligible basis of the phenomenal world by the forms of the Sense and the Categories, the Reason becomes entangled in an unavoidable Dialectic, for which there is no objective, but only a critical solu-tion. The objects of this Dialectic, the carrying

of Nature), the Reason is involved in a series of self-contradictions (in the Kantian technology, antinomies). The result, according to K., of the critical examination of all claims to a knowledge transcending Experience in the regions of rational or speculative Psychology, Cosmology, and Theology, is the necessity for abandoning the hope of attaining such. The idea (native to the Reason) of the Unconditioned is allowed to possess a regulative, not a constitutive value; that is to say, it is a principle necessary for the extension of our inquiries beyond the fixed limits of experience, without, however, yielding us an extended knowledge. So far the philosophy of K. is purely negative and destructive. Hamilton, Mansel, and others have—in regard to the limits Mansel, and others have—in regard to the limits of the knowable—merely reiterated the arguments of the great German, while in regard to the points in which they do differ from him, as, for example, the nature of our knowledge, it is a matter of very great doubt if they are as logical and consistent as their predecessor.

But the austere and stoical morality of K. was something too positive to allow him to rest satisfied with merely negative results; hence he sought in the reality of his Ethics a compensation for the nihilism of his Metaphysics. He maintained the unconditional validity of the Moral Law, and of the consequences which legitimately flow from it. This validity, however, it should be observed, is simply moral, and in no way demonstrates the metaphysical reality of the ideas, which, nevertheless, by a power of its own, it compels us to accept. The Reason, as operating in the sphere of Ethics, is called by K, the Practical Reason, or the Practico-legislative Reason. The ideas which the Practico-legislative Reason postulates are, 1st, the idea of Freedom; 2d, of Immortality, as the necessary condition for an ever-increasing approximation to the fulness of the Moral Law; and 3d, of the Being of God, as the necessary condition of such a regulation of the universe as shall shew the order of nature to be the expression of a moral design. Rejecting all the onto-logical, cosmological, and physico-theological proofs of the existence of God as mere futilities, K. based his belief in God on the inward necessities of a practical morality. Religion -i. e., the recognition of our duties as divine commands—has, in the system

of K., the closest dependence on Morality; in fact, becomes identical with it. This purely ethical conception of religion led him to a criticism of the positive dogmas of theology from an ethical standpoint, in which are contained most of the elements of theological rationalism. The application of the Practical Reason, as understood by K., to the Practical Reason, as understood by K., to Asthetics and Jurisprudence is equally fruitful of important results. K.'s first work, Gedanken von der wahren Schitzung der lebendigen Kräfte Choughts on the True Estimation of the Active Powers), was published in 1747. The principal of its successors were, Die falsche Spitzfindlykeit der vier sullegistischen Einer. his Successors were, I mach i programagner wer wire syllogistischen Figuren (The False Hair-splitting of the Four Syllogistic Figures, 1762), Beobach-tungen über das Gefühl des Schönen und Erhabenen (Observations on the Beautiful and Sublime, 1764); De Mundi Sensibilis et Intelligibilis Forma et Principiis (On the Form and Principles of the Sensible and Intelligible World, 1770); this is the prelude to his Kritik der reinen Vernunft (Critique of the Pure Reason, 1781); Grundlegung der Metation. The objects of this Dialectic, the carrying of the Fure Reason, [781]; Grandleping the Meta-out of which constitutes an essential and Icading physick der Sitten (Basis of the Metaphysics of part of the Critique of the Fure Reason, are the Soul, the Worth, and God; and in relation to the (Critique of the Practical Reason, 1788), Kritik Soul, the Worth, and God; and in relation to the (Critique of the Tractical Reason, 1788), Kritik Beginning and End of the Worth, of the Beginning and End of the Worth, and the Critique of the Judgment, Non-unity of the ultimate particles of Thing, of blosces Terming! (Religion within the Limits Causality through Freedom or through the necessity) of Mere Reason, 1799. For an account of the

influence of K. in the development of speculation in Germany, see German Philosophy.

KAOLIN is the name given by the Chinese to the fine white clay which they use in making their porcelain. It is furnished by the decomposition of a grantite rock, the constituents of which are quartz, mica, and felspar, the latter having gradually monifered, by the joint action of air and water, into this substance. A very similar clay, to which the Chinese name has been given, occurs near St. Austel in Cornwell, and near Limoges in France; near Newcastle and Whimigeon, Jel. 1, Ferth Amley, N. J., Bichcastle and Whimigeon, Pel. 1, Ferth Amley, N. J., Bichcastle and Whimigeon, Pel. 1, Ferth Amley, N. J., Bichcastle and Whidington, Pel. 1, Ferth Amley, N. J., Bichcastle and Whidel Sillar of aluminis; and these clays, which are much valued by the porcelain-makers, and be represented by the formula Ald 2, 28(1); + 2110.

KAPILA, the renowned founder of the Sankhya (q. v.), one of the philosophical systems of the Hindus. Professor J. E. Hall, in his learned and excellent preface to his edition of the text-book of the Sankhya, the Sankhya-Pravachana, says: 'By the prevalent suffrage of mythology, Kapila is reputed to have been a son of Brahma; but he is otherwise described as an incarnation of Vishnu, He is also recounted to have been born as the son of Devahuti; and again is identified with one of the Agnis or fires. Lastly, it is affirmed that there have been two Kapilas—the first, an embodiment of Vishuu; the other, the igneous principle in human disguise. It must be acknowledged, in short, that we know nothing satisfactory concerning Kapula; the meagre notices of him that are pro-ducible being hopelessly involved in uncertainty, and inextricably embarrassed by fable. Yet it may be credited, with but little hesitation, that he was something more substantial than a myth; and there seems to be tolerably good ground for receiving, as an historical fact, his alleged connection with the Sankhya.' - Biblio'heca Indica, Sankhyapr., p. 14, seq.

KARAITES. See JEWISH SECTS.

KARAMA'N, KARAMA'NIA, or CARA-MANIA, an inland eyalet of Asis Minor, is bounded on the W. by Anatolis, on the E. by Rumili, on the S. by the Taurus Monatains. Cattle-breeding is the chief employment of the inhabitants, who are for the most pert nomable Turks. The town of the control of the control of the control of the condition of the control of the control of the condition of the control of the control of the constrome of the control of the control of the constrome of the control of the control

KARAMSIN, NICHOLAS MICHAILOWITSH, the reatest of Russian historians, was born on 1st December 1766, at Bogoroeldza, in the government of Simbusk. His father was an officer of Tartar descent, and placed him in the army, but he soon retired from it, and devoted himself to literary pursuits, and after a tour in Germany, Switzerland, and France, took part in establishing the Moscow Journal, and published volumes of tales, poetry, &c. But the work which first gained him a high reputation was his Letters of a Russian Traveller (6 vols. Moscow, 1797-1801), a work which exercised an extraordinary influence in the improvement of literary taste in Russia. After some other literary attempts of no great importance, he directed his attention to the history of his country. In 1803, he was appointed imperial historiographer, with a pension of 2000 rubles; and from this time he laboured uninterruptedly at his *History of* Russia (12 vols. Petersb. 1816—1829), for the preparation of which he had access to all the national archives. For this work, the Emperor Alexander, who had read part of it in manuscript, made him a present of 60,000 rubles. It has been translated

It is in high repute in Russia, displays much research and judgment, and is, in fact, by far the most valuable work in Russian historical hterature. K. died on May 13, 1826.

KARA'SU-BAZAR, a manufacturing town in the Crimea, 25 miles cast-north-cast of Simferopol. It is surrounded by gardens, and contains 5 churches and 22 mosques with numarets. Fop. 15,287, who carry on considerable trade and manu-

facture morocco leather and other articles.

KARATCHE'F, a town in the north-west of the
government of Orel, European Russia, on the
Sniejas, an affluent of the Dezna, dates from the
12th c., and contains 10,750 inhabitants, who carry
on a large trade in cordage.

KARDZSA'G-UJ-SZALLA'S, a market-town of Hungary, capital of the district of Great Cumania, is situated about 90 miles cast-south-east of Pesth. It is the centre of a district of exnherant fertility, and is the mart for the grain, fruit, wine, and cattle raised in that district. Pop. 12,000.

KARF'LIA, an ancient province of Sweden, near the Gulf of Finland, annexed to the Russian empire by Peter the Great, and now forming portions of the governments of Finland, St Petersburg, Olonetz, and Archangel. The original inhabitants were of Finnish origin.

KARENGIA (Pennistum distichum), a grass closely ullied to the Millets, and producing a gram of the same kind. It is a native of Central Atrica, and is extremely plentiful on the southern borders of the Sahara, supplying in some places the principal part of the food of the inhabitants.

KARIKAT, a remnant of the once extensive possessions of France in India, lies on the Coronandel Coast, on the estuary of one of the branches of the Kaveri, within the limits of the Brtish district of Tanjore. It contains only 63 square niles, with about 50,000 inhabitants, of whom more than 49,000 are natives. K. was ceded to the French by the Rajah of Tanjore in 1759. Having subsequently fallen into the hands of the English, it was restored at the general pacification of ISI4, on condition that it should nether contain any forthin-cation, nor possess any garrison, unless for purposes of police. This tract is of little commercial important that the estuary is navigable even for coasting craft. K. is 150 miles to the south of Madras, being in lat. 105 55 N., and long 79 53 15.

KARNA'C. See THEBES.

KARRAC. See ILEAS.

KARRAC is the original Hottentot term, now generally adopted into the language of physical geography, for the immense barren tracts of table-lands, about 2000 feet above the sea-level, which capp such a farge portion of the surface of the Cape Colony and the region north of it. The karroos of South Africa are generally composed of shallow beels of the richest clay-soil, resting on a substratum of slaty rock, and only want the fertilising power of water to render them as productive as any other part of the surface. After high which as quickly vegetation quickly spring the provided of the contract of the surface. The power of the contract of the surface. The provided is the contract of the c

paration of which he had access to all the national archives. 60 miles, and only inhabited by the Boers in the winter season, when water and grass are abundant.

Within the last few years, by the introduction of nerino sheep, and the construction of danns, land in the karroo is becoming more valuable; and farms that, a few years ago, were considered nearly valueless, now realise considerable sums.

KARS, the capital of a pashalik in the Turkish evalet of Ererum or Armenia, 110 miles northeast from Erzerum, near the Russian border. It is situated on a table-land of upwards of 6000 feet in elevation; the climate is therefore rather severe. Pop. 1,2000, mostly Armenians, who carry on an active transit trade. In 1828, it was taken from the Tarks by the Russians under Pakievitzeh. The siege of K. by the Russians under Mouravierf, and its defence by the Turks, with the sail, and under the conduct, of General Williams, form one of the most brilliant passages in the history of the Turks of the Company of Theoremse.

KARTTIKEYA, the Hindu Mars, or god of war, a being represented by the Puranic legends as sprung from Siva, after a most miraculous fashion. The germ of K. having fallen into the Ganges, it was on the banks of this river, in a meadow of S'ara grass, that the offspring of S'iva arose; and as it happened that he was seen by six nymphs, the
Ki'ittikûs (or Pleiades), the child assumed six faces, to receive nurture from each. Grown up, he fulfilled his mission in killing Taraka, the demon-king, whose power, acquired by penances and ansterities, threatened the very existence of the gods. He accomplished, besides, other heroic deeds in his battles with the giants, and became the commander-in-chief of the divine armies. Having been brought up by the Krittikas, he is called Karttikeya, or Shan'matura, the son of six mothers; and from the circumstances adverted to, he bears also the names of Gangeya, the son of Ganga; S'arabhû, reared in S'ara grass ; Shan'mukha, the god with the six faces ; &c. One of his common appellations is Kumāra, youthful, since he is generally represented as a fine youth; and as he is riding on a peacock, he receives sometimes an epithet like S'ikhivahana, or 'the god whose vehicle is the peacock.'

KASCHAU, a town of Hungary, is situated in the beautiful valley of the Hernad, surrounded by vine-dad mountains, 130 miles north east of Pesth. It contains 15 churches, of which that of St Elizabeth (built 1342—1382) is said to be by far the finest Gothic edifice in Hungary. Stoneware, leather, doth, sugar, tobacco, and raper, are manufactured. Pop, exclusive of suburbs, 13,100. Two battles were fought near K, during the Hungarian revolution, both of which the Austrians gained.

KASHA'N, one of the most flourishing towns of Persia is situated in a well-peoplet, well-cultivated district, 3690 feet above sea-level, and 92 miles north of Ispahan. The vicinity is celebrated for its fruit, and the town for its extensive manufactures of silk-stuffs, gold brocade, carpets, and coppervares. It is a large town, and abounds, like all Persian towns, in mosques, bazaars, baths, &c. Pop. 30,000.

KASHGA'R. See CASHGAR.

KASKA'SKIA, a river of Illinois, United States of America, which rises in the eastern part of the state, and running south-west, falls into the Mississippi at Kaskaskia. It is navigable to Vaudalia, 150 miles.

KASSIMOF, a town in the north-east of the government of Riazan, European Russia, on the Lett bank of the ORa, dates from the 12th century. Pop. 10,08S. The chief branches of industry are rauning, rope-making, and chemicals. In the vicinity are several tombstones and other interesting relies of the time of the Mongolian rule.

KASTAMU'NI, a town of Turkey in Asia, in the north of Anatolia, is capital of an eyalet of the same name. The glory of this city has to a great extent departed. It contains thirty mosques, and about as many public baths; but its industrial products comprise only ootton goods to a small extent, and some conper-waves. Pop. 30,000.

and some copper-wares. Fop. 30,000.

KAT RIVER, a branch of the Great Fish River, in the Cape Colony, rising in the Didimaberg, in the valleys of which, in 1828, were settled, under the care of the London Mission Society, a large body of Hottentots and Bastancky, who occupied the country formerly inhabited by the Kahr chief Macomo and his people. But in the commencement of the war of 1859, the credulous the Hottentot population believing that the Colonists were about to drive them from their farms, threw themselves into the arms of the Kahr chiefs. This left to the brashing my of the settlement an insison station and exclusive native reserve; and it now forms the division of Stockenstroem, and is inhabited by a rather dense, mixed population of Hottentots, Fingoes, and Europeans. It is one of Hottentots, Fingoes, and Europeans. It is one of the best watered, wooded, and fertile districts in the Cape Colony, and includes an area of about 400 square miles.

KATER, HENRY, a mechanist of considerable eminence, was born at Bristol in 1777, and died in London in 1830. At his father's desire, he began the study of the law, but in 1794 reliquished his legal studies, and obtained a commission in the 12th Regiment of Foot, then stationed in India. During the following year, he was actively engaged, under closed Lambton, in the trigonometric survey of India; and on his return in 1808, became a student in the senior department at Sandhurst, and was shortly afterwards promoted to a company in the 62d Regiment.

His contributions to science are chiefly to be found in the Philosophical Transactions, to which, between the years 1813 and 1828, he contributed fifteen papers. The most important of these memoirs are those relating to his determination of the length of the seconds' pendulum at the latitude of London; and those which describe his 'floating collimator, an instrument for aiding the determination of the horizontal or zenith points. For the invention of this instrument, he received the gold medal of the Royal Astronomical Society. In addition to these memoirs, he was, conjointly with Dr Lardner, the anthor of 'A Treatise on Mechanics' in the Cabinet Cyclopædia. Most of the learned societies in Great Britain and on the continent enrolled him among their members. His memoirs on the verification and comparison of the standards of weights and measures of Great Britain and Ireland, induced the emperor of Russia to employ him to construct-standards for the weights and measures of that country; and for these labours he received the order of St Ame, and a diamond snuff-hox. He died from an affection of the lungs in the fifty-third year of his age.

KATRINE, Loui, one of the most celebrated of Scottish lakes, is situated near the south-west border of Perthshire. It is eight miles in length, and three-quarters of a mile in mean breadth; greatest depth, 78 fathoms; height above the sea,

about 370 feet. Its shape is serpentine, and dis-like (Lundon, 1861), has shewn that he cannot have been plays great variety of shore and background. Ben a contemporary of Părfini, as was generally assumed; Venue and Ben Au are on its banks. It contains mud in a paper recently read by him before the Royal several silets, one of which, Ellen's Isle, is the Asiatic Society (February, 1863), he has proved that centre of the action of the Lady of the Lady. this K, lived at the same time as the great grammar-Several also of Wordsworth's lyrics were written

on subjects suggested in this locality.

The waters of Loch K. are remarkably pure, having only one degree of hardness, and in all, two grains of solid matter to the gallon. The new water-supply to the city of Glasgow (q. v.) is drawn from this lake and those connected with it (Vennachar and Achray). The water is conducted tirst by a tunnel 6975 feet long through a mountain, and then by aqueducts, pipes, and tunnels, to the reservoic near the city-a distance of upwards of 25 miles.

KATSENA, a large, but now desolate town of Central Africa, capital of a province of the same name, subject to the Sultan of Sokoto, is situated in a beautiful and salubrious district in lat. 12° 54' N., and long. 7° 25' E., ninety miles north-west of Kanó. It is surrounded by a wall about fourteen miles in circuit, and contained at one time at least 100,000 inhabitants. In 1807, the conquering Falbe assailed it, and a war was commenced, which lasted for upwards of seven years. The capture of K. was achieved only through its destruction. It has now a population of from 7000 to 8000, and Kano (q. v.) has taken its place as the centre of commerce for the country.

KATTIMUNDOO', or CUTTIMUNDOO, a substance somewhat resembling gutta-percha. It is the milky juice of the East Indian plant, Euphorbia nereifolia, and is either obtained as a natural gum, which has cozed through the bark, or by making incisions, and collecting the juice which flows. is much used in India as a cement for knife-handles, and for similar purposes, but is not exported to

KATTYWA'R, a term originally applied to one of the ten districts of the peninsula of Guzerat, has gradually been made to extend, as a collective name, to the whole of them. In this larger sense, it stretches in N. lat. from 20° 42' to 23° 10', and in E. long. from 69° 5' to 72° 14', containing about 20,000 square miles, and about 1,500,000 inhabitants. This province of India, touching on part of its eastern frontier the district of Ahmedabad, is everywhere else hounded by water-the Runn and Gulf of Cutch, the Arabian Sea, and the Gulf of Cambay. Politically, the country is divided among more than 200 chiefs, some of them paying tribute to the Guicowar of Guzerat, and the rest to the British government, but all of them being under the protection of the latter. Between them, these petty princes have a revenue of about £500,000 sterling, and a force of about 4000 cavalry and 8000 infantry. The climate is unhealthy, and the surface is generally undulating. The principal crops are millet, maize, wheat, sugar, and cotton.

KATYAYANA, a name of great celebrity in the literary history of India. It belongs, in all probability, to several personages renowned for their contributions to the grammatical and ritual literature of the Brahmanical Hindus; but it is met with also amongst the names of the chief disciples of the Buddha, S'akyamuni.—The most celebrated personage of this name, however, is K., the critic of the great grammarian Pan'ini; and he is most likely the same with the K. who wrote the gramma-tical treatise called the Pratisiakhya of the white Yajurveda. See VEDA. Professor Goldstücker, in his Pan'ini, &c., his Place in Sanscrit Literature

rian Patanjali, whose date he had previously fixed between 140 and 120 before the Christian era. See

KA'TYDID, a species of Grasshopper (q. v.) of a pale-green colour, a native of North America, very plentiful in some parts of the United States, where its peculiar note is frequently heard during the summer, from the evening twilight till the middle of the night. This note is almost like a shrill articulation of the three syllables kat-y-did, following each other in quick succession, after which there is a pause of two or three minutes. The organ of sound is a transparent elastic membrane in a strong oval frame, in each of the wing-covers ; these membranes, by the overlapping of the wing-covers, can be made to rub against one another, and the sound is produced by the friction.

KA'TZBACH, a small river in the Prussian province of Silesia, falling into the Oder at Parchwitz, It has become famous in history from the battle fought on its banks on 26th August 1813, between the French troops under Marshal Macdonald, and the Prussians under Blücher, in which the latter were completely victorious. The French lost in the battle of the K. 5000 killed, and 18,000 wounded and prisoners, with 103 cannons, two eagles, and

KAULBACH, WILHELM VON, a celebrated German painter, was born at Arolsen, in the principality of Waldeck, 15th October 1805, and in his seventeenth year entered the Academy of Arts at Düsseldorf, where he soon became one of Cernelius's best pupils. He seemed thoroughly penetrated by the severely ideal and allegorical spirit of that great master, yet even from the first he displayed no lack of individual genius. Among his first important productions (1828—1829), were six symbolical figures, the best known of which is 'Apollo among the Muses.' To the same period belongs a work of a wholly different and even opposite character, 'The Madhouse, conceived and executed in the most vigorously realistic spirit. It added immeasely to K.'s reputation, and King Ludwig of Bavaria now employed him to decorate Duke Maximilian's palace in Munich. For this he executed, in the strictly antique style, sixteen frescoes illustrating the fable of Psyche and Cupid. His designs from Klopstock, Goethe, and Wieland, for the same monarch, are also worthy of mention. In 1837, K. completed his 'Battle of the Huns,' a picture representing the grand legend of the continued struggle in midair of the souls of the Huns and Romans who had fallen before the walls of Rome, which was regarded as the culmination of the new German school. Nevertheless, the realism of which we have spoken still found expression in various works, spoken still found expression in various works. His patient study of Hogarth is quite visible in his illustration of Schiller, of Goethe's Faust, and Reincke Fucks. In 1846, K. completed what is probably his chef-d'courve, the 'Destruction of Jerusalem by Titus,' It is a marvellous mixture of history and symbolism. Of K.'s other works, it will be sufficient to mention 'The Tower of Babel' (for the new museum at Berlin), and a series of frescoes representing the history of art since the renaissance (for the Pinacothek at Munich). Latterly, he has painted a great number of portraits. K. is undoubtedly one of the greatest modern painters that Germany has produced.

KAUNITZ, WENZELIUS ANTHONY, PRINCE VON,

Count of Rietberg, a great Austrian statesman, horn east, and the government of Nijni-Novgorod on the at Vienna in 1711; studied at Vienna, Acipsie, and west. Area, 23,650 square miles, §ths of which Levden; travelled in England, France, and Italy; is cultivated, \$\frac{1}{2}\$th in postures, and \$\frac{1}{2}\$th cover and being the head of an ancient and honourable with forests. Pop. in 1864, 1907, 122—mostly Christoniily, soon received important political appoint times, with a number of Moslems, and some ided family, soon received important political appoint-ments from the Emperor Charles VI. He continued to fill important situations under Maria Theresa, He gained great fame as a diplomatist, in 1748, at the congress of Aix-la-Chapelle. He was afterwards Austrian ambassador at the French court; and in 1753, was appointed court and state chancellor, and in 1756 chancellor also for the Netherlands and Italy, and continued for almost forty years to have the principal direction of Austrian politics. The project of the partition of Poland originated with him. He had so much to do in the management of the political affairs of Europe, that he was jocularly called the European coach-driver. He was very vain and confident of his own abilities, so that his highest praise for anything which he thought well done was to say with an oath: 'I could not have done it better myself.' He was narrow in his political views, regarding exclusively the supposed interests of Austria, but sincere and upright according to his notion of his duty. He took a very active part in the ecclesiastical reforms of Joseph II., so that at Rome he was styled the heretical minister. He was a liberal patron of the arts and sciences. He retired from public life on account of old age, when Francis II. ascended the throne, and died 27th June 1794.

KAU'RI, or KOWRIE, or K. PINE (Dammara custralis), a species of Dammar (q. v.), a native of New Zealand. It is a tree of great size and beauty, and is said sometimes to attain a height of 140 feet or more, with whorls of branches, the lower teet or more, with whorts of branchess, the lower of which die off as it becomes old. The timber is white, close-grained, durable, flexible, and very valuable for masts, yards, and planks. It is much used for masts for the British navy, no other being considered equal to them. The Fiji Islands, New Hehrides, and Australia produce other species, the timber of all of which is sold under the name of K. Pine, although there are differences of quality. All of them are trees of dark dense foliage. All of them also produce a resin called K. RESIN, or K. Gum, and sometimes Australian Copal and Australian Dammar, of which large quantities are imported into Britain and North America, chiefly from New Zealand. It is sometimes found in pieces as large as a child's head, of a dull amber colour, where forests of these trees have formerly grown, and is obtained by digging. It is also collected from the trees from which it has newly exuded, and is then of a whitish colour. It is used for making varnishes, &c.

KAVA. Sec Ava.

KAZA'N, a town of Russia, capital of the government, and ancient capital of the kingdom of the same name, is situated on the river Kazanka, four miles from the north bank of the Volga, and 200 miles east-south-east of Nijni-Novgorod. It was founded in 1257 by a Tartar tribe, and after various vicissitudes, was made the capital of an independent kingdom, by the Khan of the Golden Horde, which flourished in the 15th century. In 1552, the Russians, under Iwan the Terrible, carried the town after a bloody siege, and put an end to the existence of the kingdom. Pop. in 1866, 71,806. K. contains 70 churches and 9 mosques; a university, theological academy, and other educational establishments. The manufactures are leather, soap, cloth, 1868. and silk.

aters. The soil is for the most part fertile; corn is exported: the climate is rather severe, but healthy. Cattle-breeding, keeping of bees, and fishing are the chief employments of the people. There is an extensive trade in timber, pitch, and wooden dishes.

KAZIMI'RZ, a town of Poland, in the govern-ment of Lublin, on the right bank of the Vistula, 30 miles east-south-east of Radom. It was founded in 1350, and formerly carried on a flourishing trade in grain, in which a number of English commercial houses established here were engaged. K. now contains only 6700 inhabitants, of whom a great many are Jewa.

KEAN, EDMUND, was born in London about 1787. His father was a stage-carpenter; his mother, an actress. From his infancy, the glare of the footlights was familiar to him as the light of common While but a child, he made his appearance on the boards, and on one occasion gave a recitation before George III. at Windsor Castle. In 1803, he joined a strolling company in Scotland, and for eleven years he performed in country theatres. He came to London in 1814, in which year he appeared came to London in 1914, in which year he appeared as Shylock in Drury Lane, his immense popularity filling the coffers of the managing committee, and enriching himself. All London flocked to hear him; and Hazhitt, Hunt, and Lanb, who were constantly in the pit, declared that his acting was like 'teaching Shakspeare by a flash of lightning.' He twice visited America, made meteoric visits to the rowinces, and ever in the heyday of his powers the pit rose at him, to use his own expression. Unhappily, his habits were dissolute, and almost constant intoxication impaired his memory and his physical vigour. In 1833, while his son Charles was playing Iago to his Othello, the great actor broke down, and was led off the stage. He never again appeared in public. His death took place at Richmond on the 15th May 1833. His great characters were Othello, Shylock, Richard III., and Sir Giles Overreach. He was amongst actors what Byron is amongst poets, and Napoleon amongst generals.

KEAN, CHARLES, son of Edmund, was born in 1811, and educated at Eton. When his father fell into ill health, he adopted the stage as a profession. He was popular in the provinces and in America before he achieved reputation in London. He married, in 1842, Miss Ellen Tree, and after that period they acted together. He became the lessee of the Princess's Theatre in 1850, and the director of the royal theatricals. His management at the Princess's Theatre was distinguished chiefly by the splendid manner in which certain plays were produced. The utmost pains was expended on scenery and dress, and as much care was taken to avoid anachronisms as to seeure good acting. Sardanapalus, produced in 1853, was perhaps the most striking of these 'restorations as they were called. K. attempted the parts in which his father shone, but did not succeed in being more than a comparative to the superlative which the elder generation of play-gners yet remember. In a lower line of character, and in such pieces as The Corsican Brothers and The Wife's Secret, he was more at home than in the world of Shakespeare. He made several visits to America, the last of which was in 1866, and died in

KEANG-SI, an inland province of China, lies im-KAZAN (in Tartar, a gold-bottomed kettle), mediately north-west of the maritime province of Fo-

KEANG-SU', an important maritime province of China, the wealthest and most densely peopled district of the empire. See CHINESE EMPIRE.

KEATS, Jour, an English poet, was born in London in 1796. He was educated at Entield. and was afterwards apprenticed to a surgeon. Certain of his sonnets were published in the Examiner, then edited by Mr Leigh Hunt, and received his cordial admiration. He published in 1817 his first volume of poems; and in the following year Endymion appeared, dedicated to the memory of Thomas Chatterton. This poem was severely handled in the Quarterly Review and in Blackwood. He published a third volume of poems, containing Lumia, Isabella, Eve of St Agnes, the containing Limia, Isabeta, Eve of St. Agnes, the fragment of Haperion, and the odes to the Nightin-gale and the Grecian Urn. His health was at this time delicate; and shortly after the publication of his book he went to Italy, and died at Rome, on the 24th February 1821, his last moments soothed by the tender care of Mr Severa the artist. The English pilgrim can see his grave and Shelley's in affectionate neighbourhood. As admirable memoir of K., with copious selections from his letters, has been published by Monckton Milnes, Esq., M.P.

K.'s early poems are distigured by conceits and affectations, but his latest place him amongst the masters of his art. The Eve of St Agnes is as melodious as any portion of the Farry Queen; Hyperion has something of the organ-tone of Milton. His influence is strikingly apparent in the subsequent efforts of the English muse -Browning has his colour without his melody, Tennyson has his

colour and his melody both.

KECSKEME'T, a town of Hungary, 54 miles south-east of Pesth, is a station on the railway between that city and Temesvar. It is said to be the greatest market-town in the country, and with its extensive suburbs, its streets, straggling and low buildings, may be considered as a type of the Magyar town. Agriculture and vine-growing are carried on to some extent; but the inhabitants are chiefly employed in rearing cattle, sheep, horses, and swine. Five markets are held here annually; the cattle-market, which lasts for fourteen days, is the most important in Hungary. Pop. 42,089.

KEDGE, or KEDGE-ANCHOR, a small anchor used in large ships to keep the bow of the vessel clear of the bower, or principal ancher. Another use of the kedge is to move the ship from mooring to mooring in a harhour; for this purpose, it is conveyed to a distance in a boat, then dropped, and the vessel hauled up towards it by a cable

attached.

KE'DJERI, a scaport of Bengal, stands on the west side of the most westerly channel of the Hoogly, once the principal approach to Calcutta from the sea. Between it and the metropolis there is a telegraphic line of about 40 miles in length, being the first work of the kind in India.

KEEL is the backbone, as it were, of a ship, running longitudinally along the middle of the hottom. It consists of massive timbers clinched together lengthwise. From it spring, on either side, the ribs on which the ship's sides are laid, and from it, at the bow and stern respectively, the stem and the stern-post. As the decks hear by transverse beams upon the ribs, it follows that the whole weight of the ship and its contents exercise an oblique lateral pressure on each side of the keel. It is usually protected by strong iron binding, so that the keel may be as little injured as possible, in the event of the ship taking the ground. In iron vessels of modern construction, the keel is being obtained by internal tie-beams, &c. : but the absence of the keel takes away one preventive to rolling from side to side. To be 'en an even keel,' is to have the keel parallel to the surface of the water, i. e., the bow and stern equally deep.

KEELAGE, a toll or custom payable by ships for resting in a port or harbour.

KEELHAULING, a punishment in use, or formerly in use, for sailors in the Dutch navy. culprit was suspended from one yard-arm, and attached to him was a rope passing beneath the skeel to the yard-arm on the opposite side of the ship. The punishment consisted in dropping the prisoner suddenly into the water, and hauling him beneath the keel up to the yard-arm on the other side.

KEE'LSON, in a ship, passes inside the vessel

B in fig.), from stem to stern as the keel (A) does outside. The floor-timbers are passed below it, each being bolted through the keel, and alternate ones through the keelson. Like the keel, the keels son is composed of several massive timbers scarfed longitudinally together.

KEEP, in medieval fortification, was the central and principal tower or building of a castle, and that to which the garrison retired, as a last resort, when the outer ramparts had fallen. See Castle. A fine specimen of the ancient keep is still extant amid the ruins of Rochester Castle,

KEEPER OF THE GREAT SEAL, a judicial officer, whose duties are now generally merged in those of the lord chancellor.

KEEPING THE PEACE. When a person has been assaulted, or is apprehensive of an assault, he may apply to justices to order the assaulting or threatening party with sureties to keep the peace. This is done by the justice ordering the party to enter into recognisances under articles of the Peace (q. v.), called in Scotland a bond in pursuance of letters of Lawburrows (q. v.).

KEI RIVER, GREAT. This important stream divides British Kaffraria on the south-west from Kaffraria Proper, and with its branches, the Black or White Kei, the Indwe and Tsomo, all rising in the Stormbergen, drains a basin of about 7000 square miles. It is very rugged in its lower course, and its mouth, like all other Kaffrarian rivers, is hopelessly barred. Its banks have been the scene of several severe conflicts during our wars with the Kafir tribes.

KEI'GHLEY, a market and manufacturing town in the West Riding of Yorkshire, is situated on the river Aire, nine miles north-west of Bradford, Among the few interesting institutions of the town, is the Free Grammar-school, with an endowment of £240 per annum. The worsted manufactures are important, and machine manufactories and paper-works are in operation. Pop. (1861) 15,005.

KEISKA'MMA. This river forms the boundary between the Cape Colony and that of British Kaffraria. It is a purely Hottentot name, signify-ing 'clear water.' It rises in the Amatola, and with its branches, the Chumie and Gaga, waters a very fertile tract of country, formerly the head-quarters of the Amaxosa Kahrs, now densely settled with industrious German and English settlers.

KEITH, THE FAMILY OF. The origin of this, as of most other Scottish historical houses, is unascertained. It first appears in record during the latter half of the 12th c., and undoubtedly took its name from the lands of Keith in East Lothian, to which frequently dispensed with, corresponding strength the office of the king's marischal was attached. The family enters the page of history in the beginning of the 14th century, In 1305, Sir Robers of Keith, hereditary marsichal of Scotland, is found high in the continence of King Edward I. of England, bolding under him the office of joint justiciar of Scotland from the Forth to the Mounth, and sitting in the English council at Westminster as one of the representatives of Scotland. He kept his allegiance to England for some years after Bruce was errowned king of the Scotla, but joined that prince before Baanockburn, where he commanded the cavalry, and by a well-timed charge upon the English archers, contributed not a little to the fortune of the day. His services were rewarded by a large grant of land in Aberdeenshire; and the possessions of the family were still further increased, before the close of the century, by a marriage with before the close of the century, by a marriage with camberlain of Scotland, Durec's boother in law. Through this alliance, the Keitha acquired great extates in Kineardineshire, and having added to them the remarkable sea-girt rock of Dunnottar, they built or restored a castle upon it, which was

henceforth their chief seat. Earls Marischal .- About 1458, the family was ennobled in the person of Sir William Keith, who was created Earl Marischal and Lord Keith. His House reached its highest pitch of power in the person of his great-great-grandson, the fourth earl, nicknamed, from the seclusion in which he lived at Dunnottar, 'William who kept the Tower.' By marriage with his kinswoman, the co-heiress of Inverugie, he nearly doubled the family domains, which now included lands in seven shires, Haddington, Linlithgow, Kincardine, Aberdeen, Banff, Elgin, and Caithness. He was reputed the wealthiest peer in Scotland, having a rental of 270,000 marks a year, and being able, it was boasted, to travel from the Tweed to the Pentland Firth, eating from the Iweed to the Fentiand First, eating every meal and sleeping every night on his own lands. These vast possessions passed to his grand-son, George, the fifth earl, who, in 1593, founded the Marischal College and University of Aberdeen. Its walls were inscribed with the words: 'Thay HAIF SAID : QUHAT SAY THAY : LAT THAME SAY ; in allusion, it would seem, to the popular reproach which the earl had brought upon himself by adding the lands of the ancient abbey of Deer (q. v.) to his already overgrown estates. The story ran, that his wife earnestly entreated him to forego the spoil. 'But fourteen score chalders of meal and bear was a sore temptation,' says Patrick Gordon of Cluny, and the earl was deaf to her entreaties. Hereupon, it is said, she dreamed a dream, which was thought to portend the downfall of the House of Keith. She saw the monks of Deer set themselves to work to hew down the crag of Dunnottar with their penknives, and while she was laughing them to scorn, 'behold! the whole crag, with all its strong and stately buildings, was undermined and fallen in the sea.' This was written before 1660. Within little more than half a century, Duunottar was in ruins, and its lord a landless exile. At the age of 22, George, the tenth and last Earl Marischal, took part with his younger brother James in the rising of 1715. He was attainted, and his estates (yielding £1676 a year) were forfeited; but he himself escaped abroad, where he rose to distinction in the Prussian service. His communication to the British government of a political secret which he learned when Prussian ambassador at Madrid, procured his pardon in 1759. A year or two afterwards, he revisited Scotland, and bought back part of the family estates,

had risen in the Prussian service to the rank of

field-marshal, fell at Hochkirch in 1758.

Lords Keith.—Neither having any issue, the direct

Lovis Acts.—Neutner naving any usue, the direct male line of the House came to an end. He sister, Lady Mary, by her marriage, in 1711, with John, married Charles, tenth Lovd Ephantson, by whom, besides other children, she had Sir George Keith Elphantsone, Weith Light and the Sir George Keith Elphantsone, who, in 1797, was created Lord Keith of Stonehaven Marischal in the Irish peerage, and in 1803, Lord Keith of Banheath in the peerage of the United Kingdom. His daughter, the Baroness Keith, is the wife of the Count de Plahault.

Earls of Kintore.—Sir John Keith, third son of the sixth Earl Marischal, was, for his services in saving the Scottish Regalia during the Commonwealth, raised to the percape by the titles of Earl of Kintore, and Lord Keith of Invernry and Keithhall. On the death of his grandson, the fourth earl, in 1761, the estates devolved on the last Earl Marischal; and on his death in 1778, the estates of Halkertoun, the grandson of the ford Fance of Halkertoun can be also be a superior of the second earl. Her descendant is now the ninth Earl of Kintore and eleventh Lord Falconer of Halkertoun can be superior to the second service.

KELAT, the capital of Beloochistan, stands at an elevation of more than 7000 feet, in lat. 28° 52° N, and long, 66° 33° E. The district round about is fruitful, and thickly peopled. K. contains about 12,000 inhabitants. Seated on the summit of a hill, K. is a place of military importance. In the Alghan wars, it was twice taken by the British.

KELLERMANN, François Crimistophie, Duke of Valiny, born 28th May 1735, at Wolfsbuchweiler, in Alsace, entered the French army, and had risen to the rank of a maréchal-de-camp before the Revolution broke out. He warmly before the Revolution broke out. He warmly sepoused its cause, and contributed much to its progress in Alsace. In 1792, he received the command of the Army of the Centre on the Moselle, Prance by the famous cannonade of Valiny, Yet, on allegation of treason against the republic, he was imprisoned for ten months, and only liberated on the fall of Robespierre. He afterwards rendered important services in Italy, and on the erection of the Empire he was made a marshal and a duke. In the campaigns of 1809 and 1812, he commanded attached himself to the Bourbons. He described attached himself to the Bourbons. He died 12th September 1820.

portend the downfall of the House of Keith. She saw the monks of Deer set themselves to work to hew down the crag of Dunsottar with their peakinges, and while she was laughing them to soon, which of the state of the Blackwater, 13 miles north-north-knives, and while she was laughing them to soon, which will be a stately buildings, was undermined and fallen in the san. This was written before 1606. Within little san it is a state of the same that the same that

2988 were Roman Catholics, and 331 members of the Established Church.

KELP (Fr. varec) is the crude alkaline matter produced by the combustion of sea-weeds, of which the most valued for this purpose are, Fucus vesiculosus, F. nodosus, F. scrrutus, Laminaria digitata, L. bulbosa, Himanthalia lorea, and Chorda filum. These are dried in the sun, and then burned in shallow excavations at a low heat. About 20 or 24 tons of sea-weed yield one ton of kelp, which, as met with in commerce, consists of hard, darkgray or bluish masses, which have an acrid, caustic taste, and are composed of chloride of sodium, of carbonate of soda (formed by the decomposition of the organic salts of soda), sulphates of soda and potash, chloride of potassium, iodide of potassium or sodium, insoluble salts, and colouring matter. It used to be the great source of soda (the crude carbonate); but as this salt can now be obtained at a lower price and a better quality from the at a lower price and a better quality from size decomposition of sea-salt, it is prepared in far less quantity than formerly. A tou of good kelp will yield about eight pounds of ioline (which is solely obtained from this source), large quantities of chloride of potassium, and additionally, by destruc-tive distillation, a large quantity (from four to ten gallous) of volatile oil, from four to fifteen gallons of paraffine oil, three or four gallons of naphtha, and from one and a half to four hundred-weight of sulphate of ammonia,'-Ansted's Channel Islands. p. 515. Except the iodine and chloride of potassium, none of these substances are obtained under the present treatment.

In Brittany, the total annual production of kelp has amounted to 24,000 tons, but in all the British Islands the total manufacture to only 10,000 tons. Professor Ansted, in the work already quoted, shews that the manufacture of kelp might be made a source of great wealth to the Channel Isles. The Guernsey sea-weed is stated by Professor Graham to be the richest known source of iodine, and the increasing demand for that substance for photographic purposes renders the subject highly important. From the numerical data given in pp. 514, 515, of the Channel Islands, it appears that they might yield annually about 10,000 tons of kelp, worth about £4 per ton. The British supply would

thus be exactly doubled.

Before the remission of the duty on salt and on Spanish barilla, the kelp manufacture was earried on to a very large extent, and the value of many estates in the Scottish Highlands and Hebrides greatly increased in consequence of it. The rent of some farms in the Orkneys rose from £40 to £300 a year. Many thousand tons were made annually on the shores of Great Britain, which sold for £7 to £10 per ton, and employment was given to a great number of people. The manufacture is now almost extinct, and shores formerly worth £500 a year are now almost valueless, the ready production of soda from salt, and the reped of the high salt duty, having ruined the kelp manufacture,

KELP, in point of law, if found beyond high-water mark, belongs to the owner of the adjacent land. The right to kelp is often let by the owner separately from the lands in the Highlands of Scotland.

KE LSO, a town in Scotland, finely placed on the north bank of the Tweed, opposite to the point where that stream receives the waters of Teviot. The name was anciently written Kalchu or Calchou, and is supposed to have had its nrigin in a precipitous bank abounding in gypsum, still called the (halkheugh. The town derived its importance, if not its existence, from a richly endowed abbey of Tironensian monks, planted quished the stage on the 10th April 1840. He

at Selkirk in the year 1113, by King David L. when Prince of Cumbria, and transplanted, after his accession to the Scottish throne in 1124, 'to the church of the blessed Virgin Mary, on the bank of the Tweed beside Roxburgh, in the place called Calkon.' The abbey was ruined by tho English under the Earl of Hertford in 1545, and ali that now remains of it is part of the Abbey Church. It is in the later Norman or Romanesque style, and had a nave of two bays, north and south transcots each of two hays, a central tower still 91 feet high, and a choir of unascertained length. The more modern parts of the town are well built. A handsome bridge, designed by Rennie, connects Kelso with its suburb of Maxwellheugh, and commands a noble view. On the north west of the town, in the midst of a beautiful park, is Floors Castle, the seat must of a beautiful park, is Floors exite, the sex-of the Duke of Roxburgh: it was built in 1718, from the design of Sir John Vanbrugh, and was enlarged and improved by the present duke from the designs of the late Mr Playfair of Edinburgh. On the opposite bank of the Tweed are the ruins of Hoxburgh Castle, once the strongest fortress on the eastern border. The town of Roxburgh, which rose under the shelter of its walls to be one of the four chief towns in Scotland, has so completely disappeared, that scarcely a vestige of it remains. I was made a burgh of barony in 1634. It has no manufactures, and little trade, although three news-papers are published in it. Its population in 1861 was 4309.

KEMBLE, John Philip, son of Roger Kemble, an actor, was born at Prescot, in Lancashire, on the 1st February 1757. He received his education at a school in Worcester, afterwards at a Roman Catholic seminary in Staffordshire, and finally at the English College of Donai, in France. On his return to England, he adopted the stage as his profession, making his first appearance at Wolverhampton on January 8, 1776. On the 30th September 1783, he made his first appearance at Drury Lane in Hamlet-always a favourite character of his-and in 1790, he succeeded to the management of that theatre. In 1803, he purchased a share in Covent Garden Theatre, of which he also became manager. On the destruction of the building by fire, K. raised a new theatre, which was opened in 1809, the management of which he retained till the close of his theatrical career. In June 1817, he took leave of his patrons in Loudon; and a few days thereafter a public dinner was given to him, under the presidency of Lord Holland. Thomas Campbell made his retirement from the stage the subject of a spirited set of verses. He finally took up his residence in Switzerland, where he died, on the 26th

February 1823, aged sixty-six years.

K. was a great actor, and he loved to personate the loftier characters of the drama—kings, prelates, heroes. His figure was commanding, his voice sonorous and well modulated. He was especially successful in Brutus and Coriolanus: and the ancient playgoers, who remember his intonation and his Roman look, find the stage of the present day comparatively unworthy of regard.

KEMBLE, CHARLES, brother of the foregoing, was born at Brecknock, in South Wales, on the 25th November 1775. He received his education, like his brother, at Donai, and like him also, he, on his return to England, devoted himself to the stage. In April 1794, he made his first appearance at Drury Lane in the character of Malcolm. In July 1806, he married Miss De Camp, a lady who had distinguished herself in the walk of high-comedy. K., on being appointed Examiner of Plays, relincompleted his 79th year.

KEMBLE, JOHN MITCHEL, chiefly distinguished for his researches in Anglo-Saxon literature and the early history of England, was the son of Charles Kemble, and was boru in London, 1807. He studied at Trinity College, Cambridge, where he took the degree of B.A. in 1830, and afterwards that of M.A. While an undergraduate, he spent some time at Göttingen, under Jacob Grimm, which perhaps determined the bent of his mind towards Anglo-Saxon studies. The first truits of these studies was Saxon stitutes. The first truits of these scattles was an edition (1833) of the poem of Beowulf (q. v.), to a second edition of which he added a translation, with a glossary and notes. Not to mention several minor publications, he edited for the English Historical Society a valuable collection of charters of the Anglo-Saxon period, entitled Codex Diplomaticus Evi Saxonici, 2 vols. (1839-1840). But his most important work, which contains the chief results of all his researches, is *The Saxons in England*, 2 vols. (1849). This work is unfinished. The author had been making preparations for two more volumes, when he died suddenly, March 26, 1857. K. was for a good many years editor of the British and Foreign Review; he also held the office of Censor of Plays, under the Lord Chamberlain.

KEMPIS, THOMAS à, so called from his native place, Kempen, a village in the diocese of Cologne, was born probably in 1379. His family name was Hämerken (Latinised, Malleolus, 'Little-hammer'). He was educated at Deventer, and in 1400 entered the Augustinian convent of Agnetenberg, near Zwoll, in the diocese of Utrecht, of which his brother John was prior, and in which he took the vows in 1406. He entered into priest's orders in 1413, and was chosen sub-prior in 1429, to which office he was re-elected in 1448. His whole life appears to have been spent in the seclusion of this convent, where he lived to an extreme old age. His death took place in 1471, at which time he certainly had attained his 90th year, and most probably his 92d. The character of K., for sanctity and ascetic learning, stood very high among his contemporaries, but his historical reputation rests almost entirely on his writings, which consist of sermons, ascetical treatises, pious biographies, letters, and hymns. Of these, however, the only one which deserves special notice is the celebrated ascetical treatise On the Following for Imitation) of Christ, the authorship of which is popularly ascribed to him. This celebrated book has had, next to the sacred Scripture itself, the largest number of readers of which sacred literature, ancient or modern, can furnish an example. In its pages, according to Dean Milman (Latin Christianity, vi. 482), 'is gathered and concentred all that is elevating, passionate, profoundly pious in all the older mystics. No book, after the Holy Scripture, has been so often reprinted; none translated into so many languages, ancient and modern,' extending even to Greek and Hebrew, or so often retranslated. Sixty distinct versions are enumerated in French alone, and a single collection, formed at Cologne within the present century, comprised, although confessedly incomplete, no fewer than 500 distinct editions. It is strange that the authorship of a book so popular, and of a date comparatively so recent, should still be the subject of one of the most curious controversies in hterary history. The book, up to the beginning of the I7th c., had been accribed either to Thomas à K. or to the celebrated

died on the 12th November 1854, having almost in which it is attributed to the abhot, John Gersen, or Gesen, whom he regarded as clearly a distinct person from the Chancellor Gerson. From the time of this discovery, three competitors have divided the voices of the learned—not alone individuals, but public bodies, universities, religious orders, the Congregation of the Index, the parliament of Paris, and even the French Academy; and the assertors of these respective claims have carried into the controversy no trifling amount of polemical acrimony. The most recent and best account of the details of the discussion, as well as its history, will be found in Malou's Recherches historiques et critiques sur le véritable Auteur du Livre de l'Imitation de Jésus Christ (Louvain, 1849). We shall only state that M. Malou gives his verdict in favour of the claim of Thomas à K., an opinion in which the learned have now generally acquiesced. The first edition of the Imitation was printed at Augsburg, in 1486, and before the end of that century, it was reprinted upwards of 20 times in Germany. The most remarkable modern edition is a Heptaglot, printed at Sulzbach (1837), containing, besides the original, later versions in Italian, Spanish, French, German, English, and Greek. The theology of the Imitation is almost purely ascetical, and (except in the 4th book, which regards the Eucharist, and is based on the doctrine of the real presence) the work has been used indiscriminately by Christians of all denominations.

KE'MPTEN (anciently, Compodunum, Campidona), a city of Bavaria, situated on the river Iller, 64 miles south-south-west of Augsburg, with which it is connected by railway. Like most of the Swabian cities, K. grew up around a monastery, which was founded by the disciples of the great Irish missionary monk, St Gall, about the end of the 7th century. Partly by the favour of the emperors, partly through the natural sequence of the events of the period, the abbots of the monastery were the suzerains of the town and its environs, and eventually the abbot of K. became a prince-abbot of the empire (1348). In the secularisation of the ecclesiastical principalities in 1803-1804, it shared the common fate; the abbey, as well as the city and territory—comprising at that time 7 markettowns, 85 villages, and above 40,000 inhabitants being assigned to Bavaria. The present city contained in 1867, 10,998 inhabitants, and is divided into the abbatial town (Stifts-Stadt) and the city proper, which lies in the plain at the foot of the hill on which the abbey stands. It is a place of considerable trade, and carries on manufactures of cotton and linen.

KE'NDAL, or KI'RKBY KENDAL, a municipal and parliamentary borough of England, in the county of Westmoreland, is situated on the right bank of the Kent, 22 miles south-south-west of Appleby. Here, in the reign of Edward III., a settlement of Flemings, under a certain John Kemp, was formed, and afterwards the town became well known for its manufactures of woollen cloths, called, from the name of the town, Kendals. The letter of protection, dated 1331, and granted by King Edward III., tion, dated 1531, and grames by king haware re-on behalf of John Kempe of Flanders, cloth weaver, concerning the exercise of his craft, may be found in Rymer's Fædera, vol. ii. p. 283. The name, in Rymer's Foelera, vol. ii. p. 283. The name, 'Kendals,' is still applied to the cloths produced here, which, with carpets, worsted stockings, cottons, linsey-woolseys, doeskins, tweeds, and coat-linings, are the staple manufactures of the town. In the immediate vicinity are also several mills, dye, marble, ascrinous usuaer to 1 norms a x. or to use cessorated immeniate vicinity are also several milis, dye, marble, John Gerson (q. vx), chancellor of the university of and paper works. The weekly market is the chief Paris, except in one Ms., which, by a palpable ana-one for corn and provisions in the county. K. returns chronism, attributes it to Sternard; but in the year one member to the imperial parliament. Pop. (1861) 1604, the Spanish Jesuit, Mauriquez, found a Ms., 12,029. KENILWORTH, a market-bown of England, in the county of Warwick, situated 44 miles north of the town of that name, and the fashionable town of the town of that name, and the fashionable town of Leanington. Tamining operations are here carried on upon a large scale, and comb-making to some extent. Pop. (1861) 3676. The town, however, is chiefly interesting from historical association. The catale of Kenilworth, united to the crown domains in the reign of Henry IV., was conferred by Elizabeth upon Robert Dudley, Earl of Leiesster, who here, in 1873, entertained his sovereign for 17 days, at a duity control of 2000. The Part of Clarendon. Extensive remains of the castle still exist, which are well preserved, and much visited by the aristocracy and by tourists from all parts of the country. There are also ruins of the accenter measures.

KENNEBEC, a river in Maine, United States, which rise in Mooscheal Lake, in the west of the state, and runs in a southerly direction into the state, and runs in a southerly direction into the Atlantic Ocean, after receiving the Andrescoggian, 18 miles from its mouth. On its banks are the important bowns of Bath, Gardiner, Hallowell, and the state capital, Augusta. It is navigable by ships to Bath, 12 miles; by steam-boats to Hallowell, 40 miles. In its course of 150 miles, this river falls 1000 feet, affording abmadant water-power. At Augusta are falls, increased by a dam, 584 feet long, amplying water to large factories, saw-mills, &c.

KENNICOTT, BENJAMIN, an emiaent biblical scholar of the last century, was born at Totness, in Devonshire, April 4, 1718, and educated at Oxford, where he highly distinguished himself. He took his degree of M.A. in 1750, having been previously elected a Fellow of Exeter College; in 1767, he was appointed Radcliffe librarian; and in 1770, Canon of Christ Church, Oxford, where he died, September 18, 1783. The whole interest and importance of K.'s life are comprised in his great undertaking for the improvement of the Hebrew text. In 1753, he published a work entitled The State of the Printed Hebrew Text of the Old Testament Considered. This contained, among other things, observations on 70 Hebrew MSS, with an extract of mistakes and various readings, and strongly enforced the necessity for a much more extensive collation, in order to ascertain or approximate towards a correct Hebrew text. He undertook to execute the work in the course of 10 years, and laboured, until his health broke down, from 10 to 14 hours a day. In spite of considerable opposition from Bishops Warburton, Horne, and other divines, K. succeeded in ealisting the sympathics and obtaining the support of the clergy generally. Upwards of 600 Hebrew MSS., and 16 MSS. of the Samaritan Pentateuch, were collated, with the assistance of other English and continental scholars. The first volume of his edition of the Hebrew Bible appeared in 1776, and the second in 1789, accompanied by a very useful and instructive dissertation. The text chosen was that of Van der Hooght, and the various readings were printed at the bottom of the page. The Various readings were professed at the bottom of the page. The Various Lectiones I Veteria Testamenti (Parma, 1784—1788), published by De Rossi, is a valuable addition to K.'s Hebrew Bible. Jahn published at Vienaa (1806) a very correct abridgment, embracing the most important of K.'s readings.

KENNING TO THE TEICE, a phrase in which are the process by which a willow, so the process by which a willow, as expanded has also indeft in lands, which was a separate interest in a definite part thereof. She is by law entitled to the rents of one-third of the husbanl? I and is, called her Terce by v.); and the above process is carried on before the sheriff of the country, the object being to delite and set out

a particular portion of the lands to which her liferent may attach.

KENSINGTON GARDENS, one of the public ornanental parks of London, extends on the west side of Hyde Park, from which it is partly separated to the public of the part of the park of the part of the park of the parks. Near the western border of the park stands Kensington Palsee, on ellifee of brick, originally the sent of Hencage Pinch, Earl of Nottingham and Lord Chancellor of England, and afterwards bought by King William HI. William HI, Gueen Mary, Queen Aune, and George II, all died in this palace, and here her Majexty Oneon Victoria was born. The gardens at first consisted of the grounds attached to the palace, and were only 26 acres in extent, but have been frequently enlarged, and now are two and a half miles in circuit.

KENT, an important maritime county of England, occupies a portion of the south-east angle of the country, and is bounded on the N. by the estuary of the Thames, and on the E. and S.E. estuary of the Thames, and on the E. and S.E. by the Strait of Dover. Area, 1.039.419 statute acres; pop. (1861) 733,887. Besides the river which forms the northern boundary of the county, the chief streams are the Medway, the Stour, and the Darcnt, all of which flow north-east into the estuary of the Thames. The surface is undulating, being traversed from west to east by the North Downs (see article Downs). With a climate which is in general mild and genial, and a fertile soil of mixed chalk, gravel, and clay, K. is, in an agricultural sense, a highly productive county. Besides the usual crops, great quantities of seeds are raised for the London markets, as canary and radish seeds, spinach, cresses, and white mustard. There are also numerous market-gardens and orchards. Hops (q. v.) are one of the chief products of the county. Twenty-nine thousand acres, forming in all a hop-field more than twice as extensive as that of any other hop-growing county of England, are here devoted to the cultivation of this plant. Great numbers of sheep are fattened on the excellent pasturage found on the tracts of alluvial soil that skirt the banks of the Thames and Medway, and especially on the Romney Marsh, which comprises 44,000 acres. The county returns four members to parliament.

K is unessally rich in historical association. For its early history, eer article Hirrancur, It has been the scene and the condry is also bound up with the control of the country through the three the scan in insurrectimes which broke out here under Wat Tyler, Jack Cade, and Sir Thomas Wyatt. Of its numerous and interesting ecclesisate al children, it will suffice to specify here the catherlas of Canterbury and Rochester. It contains the important dock-yards and arsenals of Woolwich, Chatham, and Sheerness; and the famous watering-places of Margate, Ramsgate, and Tunbridge Wells.

KENTIGERN, St. See Mungo, St.

KENTIGHER, a term employed to denote the vehement and protracted cheers with which the rabble greeted the No-popery arators at the public meetings held in Kent to prevent the passing of the Roman Catholic Relief Bill (1828—1829).

KENTISH RAG, a dark-coloured, hard, calcareous sandstone, which occurs at Hythe, and other places on the coast of Kent, in the Lower Greenand Measures. It sometimes attains a thickness of 60 or 80 feet.

KENT'S HOLE, a large cave in the limestone rock near Torquay, Devon. It is said to be 600

feet long, with a breadth varying from 2 to 70 feet, and a height from 3 to 18 feet. The bones of the cave-bear, hyæna, &c., have been found in the mud of the cave below the stalagmitic covering. See CAVES

KENTU'CKY, one of the United States of America, in lat. 35° 30'—39° 6' N., and long. 82° 2' —89° 32' W., is bounded on the N. by Ohio, Indiana, and Illinois, E. by West Virginia and Virginia, S. by Tennessee, and W. by Missouri. Area, 37,680 square miles, or 24,115,200 acres. It has 110 counties. The nnies, or 24,(13,200 acres. It has 110 counties. The capital is Frankfort, and the chief towns, Louisville, Covington, Newport, Lexington, Danville, Maysville, and Paducah. The country is rolling, hilly in some portions, and in the south-east mountainous, some of the elevations rising to 3000 feet. Its chief rivers are the Ohio and Mississippi on its borders, and the Tennessee, Cumberland, Kentucky, Licking, and Green. The soil is mostly fertile, and the state contains some of the finest agricultural regions in America, producing wheat, maize, cotton, hemp, tohacco, and all the fruits of the warmer temperate regions. Herds of cattle find rich pasture, and thousands of swine fatten in the woods. There are coal-beds, some rich in oil, extending nearly across the state. the many caverns, the Mammoth Cave (q. v.) is the most celebrated. There are also deposits of lead, iron, heautiful marbles, and salt. There are 907 miles of railway, a taxable property of \$400,000,-000, and annual agricultural products of \$50,000,000. In 1864 there were 10 colleges in operation, 4 theologi-cal seminaries, 1 medical school. The Public-School system is attracting the attention of the government. An agricultural college, with 200 students, was established in 1868 at Ashland. Kentucky was formerly a portion of the western territory of Virginia, and once the home of warlike Indians, from the sanguinary contests with whom it derived its name—'the dark and bloody ground.' It was settled by Daniel Boone (q, v.) in 1769, organised as a territory in 1790, admitted as a state in 1792. Upon the breaking out of the rebellion in 1861, strenuous efforts were made by Governor Magoffin to force the state into the vortex of secession, or at least to place her in an attitude of so-called neutrality. Better counsels, however, prevailed, and the loyalty of the state was maintained, though many of her citizens was maintained, though many of her citizens joined the ranks of the rebels. Pop. in 1860, 1,155, 713 (225,490 slaves); in 1870, 1,323,264. KENTUCKY, a river of Kentucky, which rises

in the Cumberland Mountains, on the south-east frontier of the state, and after a winding north-west course of 260 miles, enters the Ohio, about 50 miles below Cincinnati. The river runs through most of its course between perpendicular limestone rocks, through which it appears to have worn its bed, and is celebrated for the romantic beauty of its scenery. It is navigable by steam-noacs of Frankfort, 60 miles, and by means of 17 dams and locks, to the Forks. Its banks abound with It is navigable hy steam-boats to

KE'OKUK, a city of Iows, in the south-east corner of the state, on the Mississippi River, 205 miles above St. Lonis. It is the site of the State Medical College, and has several academies and public schools, 10 churches, 4 banks, and a hospital. K. has a large commerce, being at the head of the low-water navigation of the Mississippi and the terminus of two railways. Pop. in 1864, 10,735.

KEPLER, or KEPPLER, JOHANN, one of the greatest astronomers of all ages, was born in DESOLATION, is situated in the Southern or Mag-stat, a small village in Witrenberg, ten miles Antarctic Ocean, the latitude and longitude of its from Stuttgart, 27th December, 1571. While a southern extremity, Cape George, being 49° 54° S, mere child he was left to his own resources, and and 70° 12° E. It is about 100 miles long his early education in consequence would have been and about 50 miles broad. It consists chiefly of 782°.

entirely neglected had he not been admitted into the convent of Maulbrun. K. afterwards studied at the university of Tübingen, and devoted nearly the whole of his time to mathematics and astronomy. In 1593, he was appointed Professor of Mathematics at Gratz. At this time K.'s views of astronomy, as seen in his Prodromus, were somewhat mystical; he supposed the sun, stars, and planets were typical of the Trinity, and that God distributed the planets in space in accordance with the regular the planers in space in accordance with the regular polyhedrons, &c. Yet this searching after harmony led him to the discovery of the three remarkable truths called Kepler's laws. K., about 1596, com-menced a correspondence with Tycho-Brabé, and in 1599 went to Prague to aid him in his researches. Tycho obtained for him a government appointment; but the salary was not paid, and K. lived for eleven years there in great poverty. He then obtained a mathematical appointment at Linz, and, fifteen years afterwards, was removed to the university of Rostock; but poverty from the same cause still pur-eued him, and he died shortly after at Ratisbon, 15th November 1630. K.'s connection with Tycho-Brahé had a salutary effect upon his fiery enthubrane had a santary effect upon his hery enthusiasm, but, happily for science, the timid counsels of the old astronomer were only partially followed.

K. established the law of the diminution of light in proportion to the inverse square of the distance, and was acquainted with the fact 'that the attrac-tive force of the sun decreases as his light;' it is strange that this latter fact did not lead him to anticipate the discovery of Newton. In 1609, he published his Astronomia nova, a commentary on the motions of Mars, in which, taking for his hase of operations the observations of Tycho, he determined the executricity and aphelion of this planet, on the supposition of a circular orbit, and found the results quite irreconcilable with observation. This led him to his first law, that the planets move in ellipses with the sun in one of the foci. The second law. that the Radius-vector (q. v.) sweeps over equal areas in equal times, he at first asserted dogmatically, and was for a long time puzzled to find some proof of it (the infinitesimal calculus not having at that time been invented); but at last he hit upon the expedient of dividing the ellipse into an immense number of small triangles, whose areas could be easily found. His third law (the first discovered) was an attempt to harmonise in some way the period and mean distance of the planets, and after twenty-two years of vigorous application, he discovered that the square of the periodic time is proportional to the cube of the mean distance. These discoveries, great as they undoubtedly are, are rendered still more so when we take into account the little real knowledge of the heavenly hodies existing at that time, and the scanty means in the hands of astronomers for making discoveries. K. also affirmed the essential inertia of matter, the first of Galileo's laws of motion; the dependence of the curvature of the path of planets on the attraction of the sun (K. unfortunately thought it was magnetic attraction) and the proportionality of the mutual attraction of bodies to their respective masses; he demonstrated the four new planets of Galileo to be satellites of Jupiter; gave a complete theory of solar eclipses; and calculated the exact epoch of the transits of Mercury and of Venns across the sun's disc. He also made numerous discoveries in optics, general physics, and geometry. KE'RGUELEN'S LAND, or ISLAND OF

said, however, to produce coal fit for steam-ships. The island was discovered in 1772 by the French navigator, Ives Joseph de Kergnelen Tremarec.

KERGUELEN'S LAND CABBAGE (Pringlea antiscorbutica), the only known species of a very curious genus of plants of the natural order Cruciferce, and further interesting as being found only in that most lonely of islands, Kerguelen's Land, and as being extremely useful to the crews of whalers and other vessels which have occasion to touch there. It has a long, stout, perennial, rootstock; a bolled head of leaves very similar to those of the common garden cabbage. Captain Cook first discovered this plant, and directed attention to it. It is exceedingly abundant in all parts of Kerguelen's Land, which produces only seventeen other flowering plants. The root-stocks have the flavour of horse-radish. The dense white heart of the cluster of leaves tastes like mustard and cress, but is coarser. The whole foliage abounds in a very pungent pale-yellow essential oil, which is confined in vessels that run parallel to the veins of the leaf. The K. L. C. is used by voyagers, boiled either by itself, or with beef, pork, &c., and its antiscorbatic qualities make it very important to them.

KERMA'N (ancient Carmania), one of the eastern provinces of Persia, lying south from Khorassan, and having an area of about 59,000 square miles. The north and north-east are occupied by a frightful salt waste called the Desert of Kerman, which forms a part of the great central desert of Iran. On this extensive tract, not a blade of grass is to be seen. The southern portion, although mountainous, is equally arid and barren with the north, except the small tract of Nûrmanshir, towards the east, which is fertile and well watered. Roses are cultivated for the manufacture of 'attar of roses,' Silk and various gums are exported. Cattle, sheep, goats, and camels are reared, and the hair of the last two has long been celebrated for its length and fineness. The inhabitants, who number about 600,000, are chiefly Persians proper; the rest are Guebres or Parsees, Belüchis, and other wandering tribes.

KERMAN, the chief town, is situated near the middle of the province, in the central mountain range, and contains a population estimated at 30,000. The manufactures are chiefly shawls, carpets, and matchlocks. The trade, though still considerable, is very small compared with what it was during the last century, when K. was the great emporium for the trade by the Persian Gulf and the Indian Ocean. In 1794, it was taken and pillaged by Aga Mohammed, and 30,000 of the inhabitants made slaves. But the chief cause of the decline of its trade was the fall of Gombroon (q. v.), its port, before the rising prosperity of Bushire.

KERMANSHA'H, a flourishing modern town of Persia, in the province of Ardelan, near the right bank of the river Kerkhah. It is the centre of converging routes from Bagdad, Tehran, and Ispahan. Its commerce is considerable, and there are manufactures of carpets and weapons. Pop. 30,000.

KERMES, sometimes also known in commerce as Scarlet Grain, a dvestuff which consists of the bodies of the females of a species of Coccus (q. v.) (C. ilicis). It has been supplanted over the greater part of Enrope by Cochineal (q. v.), but is still used in some parts of the south of Europe, and more extensively in India and Persia. The K. insect is abundant in these regions, attaching itself to the leaves of a small species of oak, the K. Oak (Quercus coccifera), a low bushy shrub with evergreen spinous leaves, much resembling a holly. In some parts of Spain,

moss-covered rocks of primary formation. It is slopes of the Sierra Morena. Many of the inhabitants of Murcia live by collecting Kerines. This is chiefly the employment of women, who serape the insects from the trees with their nails, which they suffer to grow long on purpose. The K. insect attacks the young shoots of the shrub, the female affixing itself and remaining immovable, till, after attaining its full size, about that of a pea, it deposits its eggs, and dies. K. is gathered before the eggs are hatched. It is thrown into vinegar, and afterwards dried in the sun or in an oven. It has been employed from time immemorial to dye cloth of a blood-red colour. It was called *Thola* by the Phoenicians, *Coccos* by the Greeks, K. by the Arabians. From K. comes the French cramoisi. is supposed to have been the substance employed in dyeing the curtains of the Jewish tabernacle (Exod. xxvi.).

KERMES MINERAL, so called from its resemblance in colour to the insect Kermes, is nn antimonial preparation which was discovered by Glauber (q. v.). The method of preparing it subsequently became known to M. de la Ligerie, from whom the king of France purchased the prescription in the early part of the 18th century. It was at that period often described as Carthusian Powder, or Poudre des Chartres, in consequence of a Carthusian friar having effected some remarkable cures by it. Chemists differ slightly as to its composition, but it is generally regarded as a tersulphuret of antimony. K. M. is scarcely ever employed in this country, but it is much used in France and Italy. Its effects are much the same as those of the golden sulphuret (sulphide) of antimony, and of the oxysulphuret of antimony of the London pharmacopæia, it being a sudorific in small deses (half a grain, for instance), and an emetic and purgative in large

KERN, a name applied formerly to Irish and Gaelic infantry soldiers.

KERNER, ANDR. JUSTINUS, a German poet, one of the leading members of the so-called 'Swabian School,' was born at Ludwigsburg, in Würtemberg, 18th September 1786. He studied medicine at Tübingen, and finally settled as a physician at Weinsberg. Here he died, 21st February 1862. The most conspicuous qualities of K.'s poetry are a dreamy fancy and a highly original humour. His chief works are-Reiseschatten von dem Schatten cue: werks are—newscauten von dem schatten spieler Lux (Heidelb, 1811); Romantische Dichtun-gen (Karlsr. 1817); and Der letzte Blütenstrauss (Stuttg, und Tüb. 1853). As a physician, he dis-played quite a morbid interest in the phenomena of animal magnetism, and wrote several books on the subject, one of which, Die Scherin von Prevorst (2 vols. Stuttg. 1829; 4th edit. 1846), excited a great interest in America, and is believed to have originated the recent spiritualism.

KE'RRY, a maritime county in the south-west of Ireland, in the province of Munster, is bounded on the N. by the mouth of the Shannon, and on the W. by the Atlantic Ocean. Area, 1,185,917 statute acres, of which 414,614 are arable, 726,775 are uncultivated, and 32,761 are under water. 1862, the total acreage under crops was 161,062, the half of which was in meadows and pasture, the rest chiefly in oats and potatoes. The county is 60 miles in length from north to south, and 58 miles broad. Its coast-line is about 220 miles in length, fringed with islands, of which the chief are Valentia, the Blasquets, and the Skelligs, and is deeply indented by Kenmare, Dingle, and Trace Bays. Between these bays are two peninsulas, occupied by branches of the meuntain system, the K. Oak grows in great profusion, as on the which, stretching westward from the county of

Waterford, traverses the whole of the south of Ireland. The principal group is that of Macgillicuddy's Reeks, the chief summit of which, Carran Tual, 3414 feet, is the highest in Ireland. The largest rivers are the Laune, the Maine, and the Cashen. The county contains numerous lakes, some of them, especially those known as the Lakes of Killarney (q. v.), of exquisite beauty. The climate is mild, but moist, especially on the coast. The soil rests on slate and sandstone, with limestone; consists of a rich loam in the central districts, and is productive in gram-crops and in pasture. The manufactures are inconsiderable; oats and butter are the chief exports. The fisheries on the coast are extensive and profitable; they employ nearly 3000 men and boys. K. returns two members to the House of Commons.

KE'RSEY, or KERSEYMERE, a variety of woollen cloth, differing from ordinary broad cloth by being woven as a twill. See TWILL. It is easily distinguished from the common cloth by the diagonal ribbed appearance of its under side, where the nap not being raised, admits of its structure being seen.

KERTCH, previous to 1855, the most important port of the Crimea, with the largest trade in the export of corn, is situated on the eastern shore of the peninsula, on the strait of Kaffa or Yenikale. The town has a distinctively eastern air; and the appearance of the houses is greatly enhanced by the pillars and halconies with which they are furnished. The streets, like those of Constantinople, are haunted by troops of homeless dogs. K., the ancient Panticapœum or Bosporus, was the capital of ancient Taurica. Previous to 1475, it belonged to the Genoese; subsequently, it came into the hands of the Turks; and flually, in 1774, it was acquired by the Russians. On the 25th May 1855, it was taken by the allies during the Crimean War, on which occasion the Catacombs, a very valuable collection of antiquities connected with early Greek times, was ruthlessly plundered by the soldiery. Pop. 1863, 21,414.

KE'STREL, or WINDHOVER (Falco tinnunculus), a small species of falcon, and one of the most common of the British Falconidæ. It is rather

Kestrels (Falco tinnunculus): 1, the male; 2, the female.

784

rapid motion of its wings, always with its head to rapid motion of its wings, always with its nead to the wind, evidently looking for prey on the surface of the ground. Its prey consists in great part of mice; and although of course included by game-keepers in the large category of 'vernin,' and destroyed on every opportunity, it deserves the most careful protection by farmers, as a check to the excessive multiplication of mice. It more rarely captures small birds, and does not disdain cock-chafers and other insects. It is a very widely distributed bird. The male and female differ considerably in colour; ash-gray prevailing more in the former, and rusty brown in the latter.

KE'SWICK, a market-town of England, in the county of Cumberland, is situated in a charming district on the Greta, at the northern extremity of Derwentwater, 22 miles south-south-west of Carlisle. Manufactures of coarse woollen cloth and blankets are carried on here. In the vicinity, at Borrowdale, black-lead mines are worked; and K. is well known for the black-lead pencils here manufactured. Pop. (1861) 2610.

KESZTHE'LY, a market-town of Hungary, in the county of Szalad, is situated on the western shore of Lake Balaton, 96 miles south of Presburg. The breeding of horses is carried on, and there is a good trade in corn. Pop. 7500.

KETCH, a broad, strongly built vessel of two masts-viz., the main and mizzen. It is now almost obsolete, but formerly was the favourite form for state yachts, and, till very lately, was the prevail-ing mortar-boat. In this latter capacity it was called a bomb-ketch.

KETCHO, or KESHO. See CACHAO.

KETCHUP, or CATSUP, a name common to several esteemed kinds of sauce, much used with meat, fish, toasted cheese, &c.—MUSHROOM KETCHUP is made from the common mushroom (Agaricus campestris), by breaking it into small pieces, and mixing it with salt—which so acts upon it as to reduce the whole mass to an almost liquid state—straining, and boiling down to about half the quantity. Spices of different kinds are added, for which there are many receipts, and sometimes wine. Mushroom ketchup must be kept in tightly-corked bottles.— WALNUT KETCHUP is made from unripe walnuts, before the shell has hardened. They are beaten to a pulp, and the juice separated by straining. Salt and vinegar are added, also spices variously, and after considerable boiling down, the ketchup is bottled, and may be kept for years .- Tomato Kerchur is made in a similar manner from tomatocs, but is not strained. These are the three most esteemed kinds.

KE'TTERING, a market-town of England, in the county of Northampton, is situated 13 miles north-north-east of the town of that name. The parish church is a large and handsome specimen of parisa cintrol is a large and handsome specimen when the perpendicular style, with a tower, dating from about 1450. The Free School has an endowment of £155 a year. Silk-weaving, and plush, and woolcombing are here carried on. Pop. (1861) 5498.

KETTLEDRUM, a drum formed by stretching vellum over the circular edge of a hemispherica vessel of brass or copper. This instrument, which gives forth a sharp, ringing sound, is used by regiments of cavalry and horse-artillery in lieu of the ordinary cylindrical drum, which would, from its shape, be inconvenient on horseback.

larger than the merlin, its whole length being from thirteen to fifteen inches. It may be at once a thickness of more than 1000 feet of (1) various recognised by its peculiar habit of hovering or coloured sunstaining itself in the same place in the air by a and dolomite; and (3) a series of carbonaceous

slate-clay, with gray sandstones and small irregular beds of impure earthy coal. In Britain, it consists of (1) an extensive series of red marls, with large deposits of rock-salt and gypsum; and (2) white and brown sandstones with beds of red mark. The whole reaches a maximum thickness of 1300 feet. The keuper is extensively developed in Worvester, Stat-ford, and Cheshire, England, where belts of salt, often as much as 80 or 100 feet in thickness, occur. The contained organisms differ from those of the Permian and older periods, and have some resemblance to the fossils of the Lias and Oolite. The plants consist of ferns, equisetum-like plants, eyeads, and conifers. The rocks contain a quantity of oxide of iron. In China and North America this period is represented; in the latter country in a belt from Connecticut to South Carolina. The strata are chiefly of interest to the palæontologist because of the numerous footprints they contain (see ICHNOLOGY), and the remains of the reptiles which produced them, Dinosauria, Crocodilia, Belodon, etc. The largest species from the Pennsylvania beds is the Belodon lepturus, Cope; the Clepsysaurus, Lea, was a bird-like form. Here are also found the only observed fragments-the teeth-of the oldest mammal yet known, the Dromatherium sylvestre of Emmons.

KEW, a small village in Surrey, on the right bank of the Thames, and six miles west of Hyde Park Corner. On the opposite side of the river is Brentford, with which K. is connected by a bridge. The most interesting object at K. is the Royal Botanic Gardens, containing a large and choice collection of plants, native and exotic, which have been arranged with great skill and care by Sir W. J. Hooker. The hothouses and conservatories are very numerous, There are also a palm-house, 362 feet by 100, and 60 feet high; a temperate-house, of the same height, occupying three-fourths of an acre; and a museum. The gardens extend over about 75 acres. and the pleasure-grounds connected with them to 240 acres. The Botanic Gardens were commenced by the mother of George III., but owe much of their celebrity to the able management of the present celebrity to the one management of the keeper. Since 1840 they have been open to the public in the afternoons, Sandays not excepted. There is also an observatory, which, however, is used chiefly as a meteorological station.

KEY, a common beraldic bearing in the insignic of sees and religious bouses, particularly such as are noder the patronage of St Peter. Two keys in satirie are frequent; and keys are sometimes interloced or linked together at the bows—i.e., rings, Keys intoract are placed side by side, the wards away from each other. In secular heraldry, keys sometimes denote office in the state.

KEY, a musical term synonymous with scale, from scala, a stair. The diatonic scale, as produced by nature, is a certain succession of tones and semitones, ascending from any sound taken as a basis to the octave of that sound, the semitones of which will be found to lie between the 3d and 4th, and between the 7th and 8th degrees, ascending from the basis. In rendering this succession of sounds available for musical purposes, by our artificial method of notation, the sounds have, so to speak, been fixed at a certain recognised pitch. Any of the sounds of the natural scale may be taken as a note to form the basis of a new scale, observing always the due succession of the tones and semitones. The note forming the basis is denominated the Key-note of the scale, and such scale is said to be in the key of that note. As in our notation, each whole tone can be artificially divided into two semitones (see CHROMATIC SCALE), it follows that, with the already existing diatonic semitones, there are twelve equal semitones between a key-note and its octave; and

as each of these semitones may be taken as a new key-note, there are therefore twelve keys major, and the same number minor, all differing in pitch. In written notation, the scale of the note named C has been assumed as the natural key; the notes forming that scale being held to fall naturally into the requisite succession of tones and semitones. It follows that if any other note be taken as a key-note, one, or more, or all, of the notes of the so-called natural scale must be altered, by being either sharpened or flattened, to bring the scale of the new key into the due succession of tones and semitones. Such alteration is indicated by the marks of sharps, or flats, placed at the beginning of the staff, and is termed the Signature of the key. In the minor mode, the key of A minor stands exactly in the same relation to the other minor keys as the key of C does to the other major keys, A being the key-note on which the natural minor scale is found. All other keys have sharps or flats, in greater or less number, as they are distant from the natural key of C major or A minor, reckoning by perfect fifths, ascending or descending; thus, the key of G major, which is a perfect fifth above C, has one sharp for its signature—viz., F sharp; the key of D, which is two tifths above C, has two sharps - viz, F sharp and C sharp; and so on to the key of F sharp; adding a sharp for every ascending fifth. The keys with flats are found exactly in the reverse order-viz, by descending fifths-thus, the key of F, a perfect fifth below C, has one flat-viz., B flat ; the key of B flat has two flats-viz., B flat and E flat; and so on to the key of G flat with six flats, which in practice is regarded as the same as the key which in practice is regarded as the same as the key of F sharp with six sharps. The number of flats or sharps is in some cases, for a harmonical purpose, extended still further; such as the key of C sharp with seven sharps, which is the same as D flat with five flats; or the key of G sharp with eight sharps, which is the same as A flat with four flats. unnecessary increasing of either sharps or flats only increases the difficulty of reading the music. The term key is often loosely used in the sense of mode, and we frequently hear of the major or minor key, Much confusion has arisen from this.

KEY WEST, a city of Florida, United States of America, situated on the island of Key West Sp. Cayo Hueso, Bone Key), the most westerly of the Pine Islands, of the group of Florida Keys, 60 miles south-west of Cape Sable. It is a coral island, 6 miles long, 2 wide, and nowhere more than 15 feet above the level of the sea. It has gardens of tropical fruits, and an artificial salt lake of 350 acres. There are extensive fortifications, a good harbour, two light-houses and a light-ship, several churches, a marine hospital and barracks. is beautiful, with ornamental cottages and gardens, and is inhabited by army and naval officers, traders, wreckers, divers, and invalids. The exports are salt, turtle, and sponges; but the frequent wrecks among these islands afford the most profitable business, which employs fifty vessels, manned chiefly by Conchs, or natives of the Bahama Islands, and their descendants. The climate is delightful, the temperature being from 50' to 90° F., with perpetual breezes, but there are also violent hurricanes. Pop. in 1860, 2832

KFYN, POWER OF THE (Potenta Chroison), in Roman Catholic Theology, properly signifies the supreme authority in the church, which (atholics believe to be vested in the pure, as successor of St Peter. The phrase is derived from the metaphor addressed by our Lord to Peter in Matt. xvi. 19, and which Catholic interpreters, relying on the analogous use of the phrase in Baala xxii. 22, Apoe. jii. 7, goans use of the phrase in Baala xxii. 22, Apoe. jii. 7,

and again i, 18, and also in classical writers, understand as implying the supreme power in the church. The power of the keys is divided by Catholics into two branches-that of order, which, though possessed by all bishops and priests, is believed to belong specially and primarily to the pope; and of jurisdiction, which chiefly regards the supreme government of the church, and embraces the power of enacting laws and dispensing in them, and of directing and governing not only the Christian flock, but also its pastors in their several spheres. The jurisdiction of the keys is exercised in a more limited field, and in a subordinate way by patriarchs, primates, archbishops, bishops, and other dignitaries; but that, according to the Roman theory, it has its source, as well as to the roman theory, it has its source, as wen as its chief seat, in the pope, is implied in the dis-tinctive use of the emblem of the keys as a symbol of papal jurisdiction. The technical phrase, 'power of the keys,' is also used in a more restricted sense by Catholic theologians, as applied to the sacrament of penance, in which use it designates the power of penance, in which use it designates the power of remitting or retaining sin. To this more limited sense of the word is also applicable the same dis-tinction of order and jurisdiction, of which the former is imparted to every priest by his ordination, while the latter is only communicated by an express act of the bishop or other superior.

Protestants in general regard the power of the keys as equally intrusted to the whole ministry of the church of Christ, and as including doctrine and discipline. They admit the argument from the use of the key in Scripture as a symbol of authority; but refuse to acknowledge any limitation of that authority inconsistent with their views of Christian doctrine and of the relation of the ministry to the whole church of Christ, and of Peter to the rest of

the apostles.

KEYS, Queen's. In Scotch Law, when a messenger or bailiff executes a caption or warrant under an extract decree, a writ in the former case, or in the latter, that part of the warrant which authorises him to break open the outer door of the house of the debtor, is called the queen's keys, or letters of open doors. English courts have no power to give a bailiff the right to break open an onter door in executing writs of execution for debt. See House, IMPRISONMENT.

KHALKA'S. See Mongolia.

KHAN, a title of Mongolian or Tartar sovereigns and lords. A khanate is a principality. Khayan means 'khan of khans,' but has seldom been applied. The word khan is probably of the same origin as King (q. v.).

KHA'NIA. See CANEA. KHARA'SM. See KHIVA.

KHARGEH. See EL-KHARGEH.

KHARKO'W, a government of Little Russia, immediately east of the government of Poltava. Area, 20,737 square miles; pop. (1864) 1,590,926. The surface is flat, with chalk hills following the courses of the streams. The soil is a rich and fertile loam, watered chiefly by affluents of the Don. In the north-west, the principal occupations are agriculture and distilling corn-brandy; in the southeast, the breeding of cattle and sheep. The breeding of horses is also carried on. Corn, tobacco, wax, houcy, and tallow, are largely produced, heet-root sugar is manufactured, and there is an extensive trade in sheep and cattle; but as there is almost no communication with the surrounding governments, the resources of K. may be said to be still in great part undeveloped.

three streams, affluents of the Donetz, in lat. 50° N., long. 36° 14° E., 916 miles south-south-east of Petersburg. It has now a population of 60,000, and ranks as one of the chief towns of the Ukraine. Its position between Moscow, Odessa, Kief, Taganrog, and the Caucasus has made it an important market for the exchange of the products of the north and south. The chief mercantile transactions are effected during the time of the fairs, of which there are four, the principal being the Troitsk fair. The transactions during the fairs amount to about £10,000,000. The staple article of commerce 16 wool. The town contains seventy factories of various kinds, and manufactured goods are supplied to the surrounding governments. An enormous quantity of wool (value, £1,150,000) is washed here annually. The university of K., founded in 1805, and the other educational institutions, constitute this town the intellectual as well as the commercial centre of the Ukraine.

KHARTOU'M, an important town of Africa, the chief centre of trade in Upper Nubia, stands in a sterile district, in lat. 15° 35' N., long. 32° 30' E., at the junction of the Blue and White Nile. Previous to 1847, it was the residence of the governor-general of Egyptian Sudan; it is now the seat of the local governor of the province of its own name. The principal stores of the government are kept here, and there is a government arsenal for the building and repair of boats. The houses are built principally of sun-dried bricks. K. is the centre of many converging caravan routes, and carries on considerable commerce. The imports consist chiefly of Manchester manufactured goods; the exports are ivory, gum-arabic, ostrich-feathers, bees-wax, and hides. Pop. 40,000.—See Egypt, the Sudan, and hides. Pop. 40,000.—See Egypt, the Sudan, and Central Africa, by J. Petherick.

KHATMANDU', the seat of government in Nepaul, in lat. 27° 42' N., and long. 85° 18' E. With narrow and dirty streets, and generally mean houses, it contains about 50,000 inhabitants. The architectural pretensions of the town—for even the are confined to its temples, some of them of brick. and the others of wood

KHAY'A, a genus of trees of the natural order Cedrelacce. The Kassou-Khaye of Senegal (K. Senegalensis), one of the most abundant foresttrees in that part of Africa, attains a height of eighty or one hundred feet, and is much valued for its timber, which is sometimes called Cailordra. and is reddish coloured, very hard, durable, and of bcautiful grain. The bark is astringent and febrifuge, and contains a peculiar alkaloid.

KHERSO'N, a government of Southern Russia, on the borders of the Black Sea, first appearing in history during the 4th c. B. C., when it formed a portion of the kingdom of the Bosporus. From the 11th c., the right of possession was claimed by the Poles, the Cossacks, and various Tartar tribes, the last being ultimately successful. In the 17th c., Russians commenced to settle in the province; and during the next century, their example was followed by a number of Servians. The province, with an area of 28,666 square miles, is uniformly fertile in the north and north-west; in the south it is sometimes dry and arid, with here and there sandy wastes, which towards Odessa become incrusted with salt. Notwithstanding that three large rivers—the Dnieper, Bug, and Dniester-run through the south of the province, the want of water is often severely felt, especially in July, when the vegetation is almost completely burned up by the heat. The KHARKOW, capital of the government of the climate is very changeable, being very hot in sunsame name in European Russia, on the banks of mer, and piercingly cold in winter. Destructive ravages by locusts are not uncommon. The population in 1864 was 1,33,13s, consisting of Little Russians (natives of the Ukraine), Mollavians, Bulgarians, Greeks, Germans, and Jews, who are chiefly employed in agriculture. The Germans cultivate tobacco, and rear silk-worns. Much of the arable land, however, is lost from want both of capital and labour. Cattle and sheep breeding are also carried on, on a large seale.

KHERSON, or CHERSON, capital of the government of that name in European Russia, lies on the right hank of the Duieper, near to where it widens out into the estuary of the Linnan, and 888 miles south-by-west from Macoow. It was huilt by Catharine II. in 1778, as a port for the construction of ships of war; but, in avery few years, was supplanted by Otlessa and Nikolaish, both as a dock-yard and a commercial outlet. Only ships of light draught are now built at K., and only such ships can navigate the estuary. K. is the centre of the coasting and staple trude in timber and other goods, floated down the Duieper and its tributaries, and in Crimean salt. Rope-making, tallow-melting, and wool-washing, are the chief branches of trade, and the products are largely exported. Pop. (1866) 43, 885. K. has a gymnasium, naval school, school for training pilots, and an observatory.

KHI'VA (anc. Chorasmin), KHAUREZM. KHARASM, or URGUNGE, a khanate of Turkestan in Central Asia, lies between lat. 37 45'-44' 30' N., and long, 50' 15' -63' E., and contains about 195,000) square miles (not including that part of the Kizilkum Desert over which the khan arrogates sovereignty). It is bounded on the X. by the Russian territory and Sea of Aral, E. by the khanates of Khokan and Bokhara, S. by Persia, and W. by the Caspian Sea. The chief oasis, in which the capital, Khiva, is situated, stretches from the month of the Amu-Daria for 200 miles along its banks, and is watered by canals supplied from that river. Its extent is variously estimated at from 2000 to 4000 square miles, with a population of about 200,000. The dominant race, though not the most numerous, are the Uzbeks. Agriculture is here in a very advanced state, for though the soil is naturally barren, the perseverance and energy of the people have, by means of skilful tillage, irrigation, and the application of manure, converted arid tracts into a most productive soil. The principal crops are wheat, barley, rice, potatoes, cotton, flax, and madder, besides the mulberry, vine, apple, and other fruits. Woollen, cotton, and silk goods for use and export are manufactured by the women; and a large trade in these fabrics, but chiefly in agricultural produce, is carried on with Orenburg, Astrakhan, Cabul, and Bokhara, by means of caravans.

K., in ancient times, was nominally subject to the Seleucidæ, subsequently it formed a part of the kingdoms of Bactria, Parthia, Persia, and the Califate, and became an independent monarchy in 1092 under a Seljuk dynasty. The Khivans, or, as they were then called, the Khaurezmians, after conquer-ing the whole of Persia and Afghanistan, were obliged to succumb to the Moguls, under Genghis Khan in 1221. In 1370, it came into the hands of Timûr. Timûr's descendants were subdued in 1511 by Shahy Beg (called Sheibani Khan by western writers), chief of the Uzbeks, a Turkish tribe, and his successors still rule over Khiva. In 1717, Peter the Great attempted to conquer it, but his army was totally defeated; the attempt was renewed in 1839 by the Czar Nicholas, with the same result; the greater part of the Russian army perished in the desert. The hostility to Russia is greatly on the increase, the new

province of Russian Turkestan (Sir-Daria and Seemicethensk) having been established on the borders of Khiva in 1865, and reorganised in 1867,—KHIVA, the capital of the khanate, is situated in the great oasis, in lat 41° 40° N., and long, 60° 13° E., and consists almost entirely of cartil-inte, not excepting the residence of the khan, the only stone-buildings the residence of the khan, the only stone-buildings the residence of the khan, the only stone-buildings the residence of the contrary, and its lazzar is well supplied with English, Russian, and native cloths and pottery, together with groceries and hardware, which are chiefly imported from Russia. Pop. about 13,000.

KHOJEND, a town of Independent Turkestan, on the Sir-Daria, the ancient Jaxartes, about 39 miles north-west of Khokan. It is the seat of some cotton manufactures, and of a considerable transport trade between the Russian dominions and the khanate of Khokan, to which it belongs. Pop. estimated at nearly 30,000.

KHOKA'N (originally Kokand), a khanate of Turkestan, lying east from Khiva. Its area has been estimated at 227,500 square miles, and its population at from 1,500,000 to 2,000,000. right bank of the Sir-Daria - the chief river of the khanate-the country is mountainous. On the left, is an immense sandy waste. The climate is various, being rigorous on the heights, and genial in the plains and valleys. K. is famous for its fruits, among which the apricot, apple, pear, almond, melon, and water-melon are cultivated with the greatest success, the last-mentioned being specially prized. All the towns and villages are surrounded with gardens; the vine and mulberry tree are every-where cultivated. K. is now locked within Russian fortifications, and may soon become absorbed into that empire. - KHOKAN, the capital of the khanate, is situated on both banks of the Sir-Daria, 230 miles north-west of Cashgar. It is surrounded by a mud-wall, pierced by twelve gates, and enclosed by a ditch. Besides baths and bazars, the town contains 360 mosques. K. was founded about the middle of the 18th c., and has now a population of 30,000, or, according to Chinese and other reports, of 60,000 or 100,000.

KHOLMOGO'RY, a town in the government of Archangel, European Ilussia, was a place of great note when the White-Sea trade was in its glory, but since the scat of government has been removed to Archangel, K. has steadly declined, and now contains only 1144 inhabitants. Peter the Great, on this return from his travels, brought to K. several specimens of the Dutch breed of cattle, by means of which the natives have so improved their own, that the K. breed is now considered to be the best in Russia.

KHONSA'R, a town of Persia, in the province of Irak-Ajemi, 80 miles north-west of Ispahan, and on the route from that city to Hamadan. Orchards abound here, and the raising of fruit, with weaving, are the chief employments of the people. Pop, about

12,000.

KHORASSAN (anc. Parbia, Margiana, and Ario), the largest province of Persia, lies between lat. 31"—38' 30 N., and long, 53"—62" 30' E, and contains about 210,000 square miles, of which nearly one-third is a vast salt waste; of the remainder, a large portion consist of plans of shifting sand; and the rest is fertile. The fertile districts are in the north, where the high range of the Elburz in the north, where the high range of the Elburz an nontrainous districts are supported by the contraining a mountainous district flowering on the product of the contraining an include the contraining and the contraining an include the contraining and the contraini

which have unsettled the district for the last to the very gates of Ctesiphon, was deposed and 1000 years, have almost put an end to this practice. The chief products of K. are grain, cotton, silk, hemp, tobacco, aromatic and medicinal plants, fruits, wine, salt, gold, silver, and precious stones, also camels, horses, and asses. In the more thickly-peopled districts, manufactures of silk, woollen, and camels' and goats' hair fabrics, also of muskets and sword-blades, are carried on to a considerable extent. The chief towns of the province are Meshed, the capital, Nishapur, Yezd, and Astrabad. The inhabitants are Mohammedaus of the Shiah sect.

K., in ancient times, also included the desert of Khiya or Kharasm, and the district now known as the kingdom of Herat; but the first was separated from it by the Seljuks at the commencement of the 11th c., and the latter about 1510, since which period it has been on several occasions seized and

held for a short time by the Persians.

K. bas been several times separated from the Persian empire, but was finally re-united to it at the commencement of the 16th c. by Ismail Sofi, the first Suffavean shah of Persia. See Persia.

KHORSABA'D. See NINEVEH.

KHOSRÛ, or KHÛSRÛ L. surnamed Nûshîrvan (the noble soul), and known in Byzantine history as Chosroes I., the greatest monarch of the Sassanian dynasty, was the son of Kobad, king of Persia. K. mounted the throne on his father's death in 531 A. D., gave shelter to great numbers of those whom Justinian, the Byzantine emperor, persecuted for their religious opinions, in 540 commenced a war of 20 years' duration with the Roman emperor: but though the Persians reaped an abundant harvest of glory, the other results were unimportant. accession of Justin II., the Persian ambassadors having been ignominiously abused, and the Greeks having taken possession of Armenia, K., justly indignaut, again declared war in 570, took Dara, the eastern bulwark of the empire, but was terribly defeated at Melitene (577) by Justinian, grand-nephew of the emperor of that name; this defeat was, however, counterbalanced by the vic-torious Greek being in his turn totally routed in Armenia. K. did not live to see the end of the contest, as he died in 579. His government, though very despotic, and occasionally oppressive, was yet marked by a firmness and energy rarely seen among the orientals. Agriculture, commerce, and science were greatly encouraged, ravaged provinces were repeopled from his conquests, and wasted cities rebuilt. His memory was long cherished by the Persians, and many a story of the stern justice of K. is still current among them. Persia, during his reign, stretched from the Red Sea to the Indus, and from the Arabian Sea far into Central Asia.—(For a full account of this prince, see Sir John Malcolm's History of Persia.)—Khoshê II., grandson of the preceding, surnamed Purviz (the Generous), was raised to the throne in 590, but being immediately deposed by another claimant, was, by the assistance of the Emperor Maurice, reinstated, and in gratitude surrendered Dara, Nisibis, and a great part of Armenia, to the Romans. In spite, too, of numerous and just grounds of quarrel, he preserved peace with that nation till the murder of his benefactor by Phocas. K. then invaded Mesopetamia in 604, took Dara, and during 17 years inflicted upon the Byzantine Empire a series of disasters, the like of which they had never series of dishasers, the new valued they are severed to the state of the series of the

murdered by his eldest son, Shironeh, or Siroes, 28th February 628. It was to this prince that Mohammed sent a letter demanding a recognition of his mission, See MOHAMMED.

KHUZISTA'N (anc. Susiana), a province of Persia, in lat. 30—33° 7' N., and long. 47° 45'—51° E., having Fars and the Persian Gulf on the S., is divided into two almost equal portions-the one, the north-east, very hilly, the other, the south-west, so level as to be almost a stagnant sea during the rainy season, changing to an arid waste in summer. K. contains extensive pastoral districts, on which vast herds of cattle are reared, and naturally abounds in alluvial soil fitted for such crops as rice, maize, cotton, sugar-cane, indigo, &c. The silk-worm is also reared in some districts. The chief towns are Shûster, Diziul, and Mohammerah.

KHY'BER PASS, the most practicable of all the openings, four in number, through the Khyber Mountains, is the only one by which cannon can be conveyed between the plain of Peshawur, on the right bank of the Upper Indus, and the plain of Jelalabad, in Northern Afghanistan. It is 30 miles in length, being here and there merely a narrow ravine between almost perpendicular rocks of at least 600 feet in height. It may be said to have been the key of the adjacent regions in either direction from the days of Alexander the Great to the Afghan wars of 1839-1842. Here a British army, on its retreat from Cabul in January 1842, was absolutely annihilated (see Afghanistan). The gorge is understood to be extremely unhealthy.

KHYERPU'R, a town of Sinde, stands about 15 miles to the east of the Indus, in lat. 27 30' N., and long. 68 48' E. The town owes its importance, such as it is, to its having been selected as the residence of the northern Ameers of the country. The place, however, is little better than a collection of filthy mud-hovels, and it is estimated to have only

15.000 inhabitants.

KIABOU'CCA, KIABOOCA, KYABUCA, or AMBOYNA WOOD, a beautifully mottled wood, which is found in our timber-yards in small pieces, very evidently the wens or excrescences formed on the stem of the producing tree, Pterospermum Indicum (natural order Byttneriacea). The colour of this wood is yellowish red, of different shades, and covered with a most elegant mottled figure in darker shades. It is much used for small ornamental articles, especially sunff-boxes, its scarcity and the small size of the pieces forbidding its employment in the manufacture of larger articles.

KIA'HTA, or KIACHTA, a town in Siberia, 150 miles south of Lake Baikal, and close to the Chinese frontier, being only separated by a piece of neutral-ground 280 yards broad from the Chinese neutral-ground 280 yards broad from the Chinese town of Mainatchin. Resident population only 285. Through this town began the commercial intercourse between Russia and China, which had been arranged by the treaties of 1689 and 1727. Since the middle of last century, a lively and profit-able barter-trade has been carried on both in K. and in Mainatchin; but it was not till the end of the century that the Russians were able to produce on their side any articles besides furs, but since then, cloth and cotton goods, first of English or French, and later of Russian manufacture, have in part been substituted. Formerly, the export to China of coins and the precious metals was forbrought to K. (more than 3000 miles), and the Russan unport duty, which amounts to from 40 to '70 kopeks. It is generally imported by the Russians at I.s. 4½ per lb. But it must not be overlooked that the K. tea is the first crop, immensely superior to all that reaches Europe by any other route.

KIDDERMINSTER, a well known manufacturing town and municipal and parliamentary brough of England, in the county of Worcester, is situated on the Sour, four miles above its junction with the Severn. The parish church is a handsome edifice, parly in the decorated and partly in the perpendicular style. K is chiefly noteworthy on account of the carpet manufactures which are here carried on. The borough returns a member to the House of Commons. Pop. (1861) 15,399.

KIDXAPPING is not a legal term, but is frequently applied in popular language to the offence of stealing or forelibly carrying off a child or adult. It of the property of the child of the control of the child of the child of the child of the child is my resonant, though only up and the the death. Child-stealing where the child is made at the child of the

KIDNEY-BEAN (Phaseolus), a genus of plants of the natural order Leguminosee, sub-order Papilionaceae, having nine stamens united by the filaments, and one separate stamen, a downy stigma, a 2-lipped calvx, and the keel of the corolla with the stamens and style spirally twisted. The species are mostly annual herbaceous plants, natives of the warm parts both of the Eastern and Western Hemispheres. The Common K. (P. vulgaris) is the Haricot of the French. In Britain, it is sometimes called French Bran. In the south of Europe, and as far north as Germany, in the United States of America, and many other countries, the K. is a field-crop, and the ripe seeds are an important article of food. Within the tropics, it is sown at all seasons; but in countries subject to frost, only in spring, after the danger of frost is over. The seeds are used for food in a boiled state. In Britain, they are not regularly ripened, except in the most favourable situations in the south. The plant is therefore cultivated chiefly for the sake of the unripe pods, which, when boiled with the young seeds in them, form a well-known and very delicate dish.—The SCARLET RUNNER (P. multiflorus) has often been regarded as merely a larger variety of the K., with long twining stem. It is doubtful, however, if they are originally from the same native country; an American origin being assigned to the Runner, which is also a perennialalthough in the climate of Britain usually destroyed by the winter's frost, and therefore treated as an annual - and has tuberous roots. The roots, in common with those of some other species of Phus-olus, are parcotic and dangerous; serious consequences have ensued from the accidental eating of them. The plant is cultivated for the same uses as the K., and affords, even in Scotland, a very abundant crop of green pods in the latter part of autumn, although the seed is not sown till about the 1st of May, It is a very ornamental plant, particularly the common variety with scarlet flowers. It readily covers any trellis or paling, and requires stakes of 6-10 feet in height. The varieties of beans cultivated in the U. States deemed most valuable are the Enrly Mohawk, one of the most esteemed kinds of pulse is the Moog, Moong, or Mungo (P. Mungo); in others, the Kala Moog, or Black Gram (P. Muc).

KIDNEY-VETCH (Inhlyllin), a geoms of phants of the natural order Leguminous, sub-order Pupilionators, custains of the natural order Leguminous, sub-order Pupilionators, contains and some birthacous, natives choices, some abrabley, and some birthacous, natives choices, and some birthacous, natives choices, and some birthacous, natives choices, and some birthacous, and some birthacous, and some birthacous, and some lateral natural instant and generally downy calve. The only British species is the Common K. (A. vulneruries), also called Ludy's Pingers, a herbacous perennial, with pinnated unequal leaves, and crowded heads of yellow (or sometimes scarlet) flowers. It grows on very dry soils, and is eaten with availity by cattle, but does not yield much produce.

KIDNEYS, The, are two glands having for their office the secretion of the urine. That this office or function is of extreme importance, is sufficiently shewn by the facts that it, in consequence of disease, it is altogether suspended in the human subject, even for a day or two, death not unfrequently occurs, and that urinary glands corresponding in function to our kidneys are found, not only in all vertebrate animals, but in almost all molluses, in the arachidakan, in insects, and in myrapoles.

The human kidneys are situated in the region of the loius, on each side of the spine, and are imbedded in a layer of fatty tissue. Their form is too well known to require any description. The average length of each kidney is a little more than four mehes, and its usual weight is from four to

Vertical Section of the Kidney. (From Gray's Anatomy.)

s, supra-renal capsule; bb, e riteal sub-tance of kidney; co, meduitary sub tance of kidney; eee, the sinus or pelvis; f, the ureter, proceeding to the bladder.

six ounces. The substance of the kidneys is dense, extremely fragile, and of a deep red colour. On making a vertical section of the kidney, it is seen to consist of two different substances, which are named, from their position, the external or cortical, and the internal or medullary substance.

variety with searlet flowers. It resultly covers any trulies or plaining, and requires stakes of 6—10 feet in part trulies or plaining, and requires stakes of 6—10 feet in part to the gland, and sead numerous prelongations height. The varieties of beans cultivated in the U. States deemed most valuable are the Early Mohazek, shattened the soft granular, and contains nume. Early Valentine, Alperian Wax-bean, Carolina, Lima, rons minute red globular bodies diffused through- and White Kidney. In some parts of India, lout it, which are called, from their discoverer, the

Malpighian bodies, and which will be presently noticed more fully. Its substance is made up of the uriniferous tubes (which are described in the notice of the medullary portion), capillaries, lymphatics, and nerves, held together by an intermediate paren-

chymatous substance,

The medullary substance consists of pale-reddish, conical masses, called the pyramids of Malpighi. They are usually about twelve in number, but vary from eight to eighteen, and their apices (the papillæ) point towards the hollow space (termed the sinus or pelvis) which occupies the interior of the gland. The medullary structure is firmer than the cortical, and instead of being granular, presents a striated appearance, from its being composed of minute diverging tubes (the uriniferous tubes, or tubes of Bellini), which run in straight lines through this portion of the kidneys, after having run in a highly convoluted course through the cortical portion.

The cavity occupying the interior of the kidneys (the sinus or pelois) is lined by nucous membrane, which, through the medium of the ureter, is continuous with that of the bladder, and which extends into the tissue of the kidneys, to line the uriniferous tubes. The mucous membrane forms a cup-like cavity around the termination of each pyramid, and the cavity, termed the calp, receives the urine from the open terminations of the tubes, and conveys it towards the pelvis, from whence it passes down the ureter into the bladder.

Each kidney is supplied with blood by a renal artery, a large trunk which comes off at right angles

Plan of the Renal Circulation in Man and the Mammalia: terminal breach of the actory, giving the terminal twis, of, to the Mahjania noth, m, from which energes the effect vessel, of. Other efferent vessels, c. c. c, are seen proceeding from other trites, and entering the capillaries surrounding the uriniferous tube, c. From this plexus of capillaries the emulgent vein, ee, springs.

to the aorta. The blood, after the separation of the various matters which constitute the Urine (q. v.), is returned into the venous system by the renal or emulgent vein, which opens into the inferior vena

The nerves are derived from the renal plexus, which is formed by filaments of the solar plexus and the lesser splanchnic nerve. They belong entirely

to the gauglionic or sympathetic system

The Malpighian bodies are found in all vertebrate animals. In mammals, which are the only animals in which there is a division into a cortical and a medullary portion, these bodies are only found in the former. In an injected specimen, they appear to the naked eye as mere coloured spots. They are for the most part of a spherical, oval, or flask-like form. Their diameter in man may range from the to rist th of an inch, the mean being to th. A small artery, termed the afferent vessel, may be traced into each Malpighian body, while a minute venous radicle,

at which the artery had entered. The Malpighian body itself consists of a rounded bunch or tuft of capillaries, derived from the afferent, and terminating in the efferent vessel, and enclosed in a clear and transparent capsule, lined at its lower part with epithelium, continuous with that of the uriniferous

tube which springs from each capsule,

The convoluted portion of the tube which proceeds from, and is continuous with, the Malpighian capsule, is composed of a delicate basement membrane, in immediate relation externally with an abundant capillary net-work, and lined in its interior by the spheroidal or glandular variety of epithelium. The diameter of its central canal is about 1000th of an inch. The straight portion of the tubes of which the pyramids are composed is lined with epithelium, which approaches more nearly to the scaly or tesselated variety, and which seems to serve as a protecting layer, rather than to take part in tho function of secretion. The tubes unite with one another to a great degree as they pass through the structure of the pyramids, so that at the base of a pyramid there may be many thousand tubes, while the number of openings at the extremity of a papilla are comparatively few.

It now remains to consider the respective functions of these two essential elements of the kidney (as it exists in the vertebrate animals), viz., the Malpighian bodies and the tubes. From the admirable researches of Mr Bowman (Philosophical Transactions, 1842), and from the labours of subsequent anatomists, it appears that in animals in which the urinary excretion is passed in an almost solid form (as in birds and reptiles), the tufts are small and simple as compared with those in the kidneys of animals which (like man and most mammals) pass the urinary constituents dissolved in a large quantity of water. On these grounds, as well as from the fact, that the anatomical arrangement of the tufts is well calculated to favour the escape of water from the blood, Mr Bowman arrives at the conclusion, that the function of the Malpighian bodies is to furnish the fluid portion (the water) of the urine. The arrangement of the convoluted portion of the tubes, with a capillary net-work on one side of their basement membrane, and secreting epithelial cells on the other, is the exact counterpart of the arrangement in other secreting glands, and there can be no doubt that the functions of the cells in the convoluted portion of the tubes is to separate from the blood the various organic constituents (urea, uric acid, creatinine, &c.) and inorganic salts (chloride of sodium and phosphate of soda, &c.), which collectively form the solid constituents of the urine. It does not necessarily follow that these secreting cells undergo rapid decay and renewal; it is more probable that they have the power of selecting certain materials from the blood, and of transmitting them. without the disintegration of their own structure, to the interior of the tube.

The physical and chemical characters of the secretion yielded by the kidneys will be considered

in the article URINE.

DISEASES OF THE KIDNEYS .- The most important affection of the kidneys is Bright's Disease (q. v.), the symptoms of which have already been described. On examining the kidneys, in a case of death from this disease, it is found that there is a great increase in the size and number of the oil-globules which the best and diameter of the originals when exist in small quantities in the epithelial cells of the healthy gland. The urinary tubes becoming thus gorged and distended, compress the capillary vessels on their exterior; and hence, in consequence of passive congestion of the Malpighian vessels, which gives rise to obstruction of the circulation, the efferent vessel, emerges from it close to the point the serum of the blood exudes in place of pure

water, and gets mixed with the urine, which of the secreting action of the kidney, or so conthus becomes albuminous in this disease. Intlammation of the Kidneys, or Nephritis, is not uncommon. In acute inflammation, there is a deep-seated pain in the small of the back, on one or upon both sides, often extending downward towards the inside of the thigh. This pain is increased by pressure, audden change of position, coughing, &c. is scanty, high-coloured, albuminous, or bloody, and often deposits pus and sedimentary matter on standing. There is more or less fever, preceded by rigors; nausea and vomiting are frequent, and the bowels are usually constinated. In chronic inflammation, most of the above symptoms are present, but in a milder form, and there is little or no fever. In both the acute and chronic form, the blood may become contaminated, as in Bright's Disease (q. v.), from the want of due purification by the kidneys, and various secondary affections may arise.

The causes of inflammation of the kidney are various. It may be due to mechanical violence, exposure to cold and wet, and to the ingestion of substances which have the property of irritating the kidneys, as cantharides, oil of turpentine, &c. A gouty diathesis and the presence of concretions may also be noticed as causes. Any affection canable of producing retention of urine, may, by distending the pelvis of the kidney, occasion inflammation, as, for example, stricture of the urethra and affections of the spinal cord producing paralysis of the urinary organs.

The treatment must, on the whole, be antiphlogistic (or lowering) in the early stage of the disease, but must be considerably modified in accordance

with the origin of the disease

Nephralgia, or Pain in the Kidney without Inflammation, which usually but not invariably depends upon the passage of a concretion through the ureter, is one of the most painful affections to which the human frame is subject. It usually comes on when the concretion makes its way from the pelvis of the kidney into the ureter, and does not cease till it has passed into the bladder. During an ordinary fit of gravel (see Lithiasis), or even in apparent health, a severe pain is suddenly felt in the loins, extending to the groin, thigh, or abdomen, and sometimes simulating colic. The pain comes on in paroxysms, with intervening periods of comparative ease. paroxysm is usually accompanied by vomiting, a small and feeble pulse, and a profuse sweat. There is a frequent desire to pass urine, but the effort is usually futile. At length, usually after some hours, or even one or two days, the concretion escapes into the bladder, and the pain suddenly ceases.

This affection may be readily distinguished from inflammation by the sudden access and paroxysmal character of the pain and by the absence of fever.

As the disease is one which is very liable to return, the patient should know what steps to take before advice can be obtained. Opium is onr sheetanchor in this affection. The patient (assuming that he is an adult) may take two grains of opium, or an equivalent dose (35 or 40 minims) of laudanum or solution of muriate of morphia, when the attack comes on, and may repeat the medicine in half-doses every hour or two hours, until the pain is somewhat alleviated, or signs of the narcotic influence of the drug begin to manifest themselves. Should the stomach be so irritable as to reject the medicine, a drachm of laudanum in a little thin starch may be injected into the rectum. Hot fomentations to the abdomen and loins also give partial relief. Chloroform may be inhaled with great benefit during the paroxysms, but only under the superintendence of a physician.

Suppression of Urine, or Ischuria renalis, is an affection in which there is either a complete cessation

siderable a diminution as to be clearly morbid. It is undoubtedly, in most cases, a mere symptom of some other disease, but occasionally no other disorder is obvious, and it must be regarded as an independent or idiopathic affection. If no urine be separated from the blood, coma (intense stupefaction) and death rapidly supervene from the retention of urea (or of carbonate of ammonia, into which it readily breaks up) in the blood, which thus becomes impure, and acts as a poison on the brain. The treatment, which is seldom successful, is too purely professional for notice in these pages

For further information on diseases of the kidneys and allied affections, see the articles BRIGHT'S DISEASE, DIABETES, DROPSY, and LITHIASIS.

KIDRON, or KEDRON. See JEHOSHAPHAT.

KIEF, or KIEV, the chief town of the government of that name, on the west bank of the Dnieper, is one of the oldest of the Russian towns, and was formerly the capital. In 864, it was taken from the Khazars by two Norman chiefs, companions of Ruric, and conquered from them by Oleg, Ruric's successor, who made it his capital. In 1240 (when it eeased to be the capital), it was nearly destroyed by Bata, Khan of Kiptchak. Christianity was first proclaimed in Russia at K. in 988. In the 14th c., it was seized by Gedimin, Grand Duke of Lithuania, and annexed to Poland in 1569, but in 1686 was restored to Russia. The K. of the present time is one of the largest towns in the empire, possessing 70,820 inhabitants, one-third of whom are Poles. It is strongly fortified, has a remarkable suspension-bridge over the Dnieper, one of the best universities in Russia, a military and an ecclesiastical school. In its neighbourhood is the convent of Kievo-Petchersk, a celebrated Russian sanctuary, which annually attracts thousands of pilgrims from the most remote corners of the empire. K. is not an industrial, but a commercial centre : large fairs take place here annually, the most celebrated of which is the 'Contracts' during the winter, which is attended by all the surrounding proprietors, and by many foreign merehants. The trade is chiefly with Odessa, Poltava, and Austria.

KIEKIE (Freucinetia Banksii), a shrub of the natural order Pandanacca, yielding an edible, aggregated fruit, said to be the finest indigenous fruit of New Zealand. The species of this genus are tropical Asiatic, or Polynesian climbing shrubs, with sheathing, long, rather grassy leaves, usually spinous or serrated on the margin; and terminal, solitary, or clustered spadices of unisexual flowers. The K. is found in the northern part of New Zealand. It climbs the lofticst trees, branching copiously. The leaves are two or three feet long. The spadices are clustered. The fruit is a mass of fleshy berries. The jelly made of it tastes like preserved strawberries.

KIEL, one of the chief towns and most important scaports of the duchy of Holstein, lying on a deep fjord or bay of the Baltic, which admits large ships to anchor close to the town, is situated in lat. 54° 20′ N., and long. 10° 7′ E. Pop. (1867) 24,216. K. is the seat of the Supreme Court of Appeal for the duchy, and of a university, which was founded in 1665, and has a library of 80,000 volumes, an observatory, a botanic garden, a natural-history museum, and a good collection of northern anti-quities. The town is clean, and tolerably regularly quities. The town is clean, and tolerably regularly built. It has two bridges, connecting the northern or older parts with the rapidly increasing southern suburbs. The most ancient of its five churches is St Nicholai, which dates from the 13th century. The castle has a good sculpture-gallery, containing,

among other copies of the best works of art, casts of the Elgin marbles, and of Thorwaldsen's best salted fish. productions. The public gardens and the wooded shores of the fjord, together with the woods of Oaks, an ancient enisoned and market town in Düsternbrook (where a bathing establishment has Posteriorrook (where a bathing establishment has existed since IS22), afford numerous pleasant walks, K., which became a member of the Haascatic League in the 14th c., is still a place of considerable commerce, being the chief mart for the farm and dairy produce of the Danish islands; and the very ancient annual fair, which is held for four weeks after Epiphany, is attended by buyers of all classes from every part of the duchies. K. has manufactures of tobacco, oil-colours, sugar, machinery, ironmongery, &c. It is an important link in the line of communication between Germany and the Baltic islands and ports; and steampackets daily convey Hamburg passengers and mails to Korsör in Seeland, Christiania in Norway, Gothenburg in Sweden, and several other ports in the Baltic and North Sea.

KIEV, a government of Little Russia, lies immediately north of the government of Kherson, and is bounded on the north-east by the river Duieper. Area, 19,546 square miles, more than one-half of which is arable, and one-fifth under wood. Pop. (1864) 2,012,095. In the northern portions, the surface is flat and marshy; the south is covered with ranges of hills, branches of the Carpathian Mountains, running from north-west to south-east. The chief river is the Dnieper, with its tributaries, the Pripet and the Teterev. The soil, chiefly loam, and partly clay and sand, is very fertile; so that, although agriculture is backward, the returns are considerable. The climate is exceedingly mild; everything is in blossom in April, and frosts do not set in till November. Agriculture and horticulture are the chief occupations of the inhabitants. Wheat is extensively exported to Odessa. There are numerous distilleries, and to Odessa. There are numerous unsumeries, and beet-root sugar, tobacco, cloth, china, and delft are manufactured. Large cargoes of timber and fire-wood are floated down the Dnieper to the ports of the Black Sea annually.

KI'LDA, Sr, a small island, lying off the west coast of Scotland, in lat. 57° 49' 20" N., sixty miles west of the peninsula of Harris, to the parish of which it is reckoned as belonging. It presents bold and lofty precipies to the sea, except at two points, one on the south-east, the other on the west side of the island. At each of these points there is a bay with a low shore. Besides the main island, there are several small islets, and the whole group has an area of from 3000 to 4000 square acres. Pop. (1861) 78. Situated in the midst of the Gulf Stream, St K. enjoys a mild climate, although the weather is often hoisterous. main island, there are eighty or ninety head of black cattle, and nearly 2000 sheep (among which is a Spanish breed, whose wool is highly prized) are grazed on it and on the surrounding islets. Immeuse numbers of wild-fowl are killed annually, the flesh of which is very generally eaten and the feathers sold. The sea abounds in delicious tish, easily caught from the rocky shore without the use of boats. The inhabitants formerly were able to export more or less grain annually; but although the population has decreased within late years, they now consume all the cereal produce of the island, hesides an additional quantity, which they import. The present inhabitants habitually confathers did. They do not receive, nor do they examples. Some stone crosses also are still pre-require, any regular gratuitous assistance from the served, and there are very many castles of the proprietor, as is often represented. The principal Anglo-Norman period, three of which are still 782 sume much more farinaceous food than their fore-

KILDA'RE (Hib. Kill-dara, Church of the Oaks), an ancient episcopal and market town in the county of the same name in Ireland, 25 miles south-west of Dublin. It owed its origin to a south-west of Dublin. It owed its origin to a monastery, founded, according to the annalists, in the end of the 5th c., by St Bridget, the daughter of an Irish chieftain, who received the veil from St Patrick himself. Around the monastery, a town of some importance sprang up, which, as well as the abbey, was repeatedly plundered by the Danes. After the English invasion, it rose to considerable importance, and a parliament was held in it in 1309. In the wars of Elizabeth, and subsequently in the Great Civil War, it suffered almost complete ruin, from which it but partially recovered. plete ruin, from winch it but partially recovered. Prior to the Union, K. returned two members to the Irish parliament. At present, it is much decayed, consisting of but 1293; 331 less than in 1841 Disse of K., together with that of Eighlin, 1842 Disse of K., together with that of Eighlin, Dublin. In the Roman Catholic, the united sees of K'ulbare and I sighlin form a distinct discress. of Kildare and Leighlin form a distinct diocese. of Khoare and Leighin form a distance diocese.

Notwithstanding its present decayed condition,

K. is exceedingly interesting for its antiquities,
which comprise the ruined cathedral, a Franciscan which comprise the rumed cathedral, a Franciscan and a Carmelite abbey, a portion of the chapel of St Bridget, popularly called 'The Firehouse,' from a perpetual fire anciently maintained there, and, above all, the round tower, 130 feet in height, which crowns the elevation on which the town is built, and is seen from a great distance.

KILDARE, an inland county of the province of Leinster, Ireland, distant at its eastern border about 14 miles from the English Channel. Its greatest length from north to south is 40 miles; from east to west, 27 miles. Its area is 418,436 acres, of which 356,787 are arable. Its surface is acres, or which 304,707 are arable. Its surface is almost all one unvaried plain, with the exception of the south-eastern border, which meets the range of the Dublin Hills, and the southern border, which likewise is slightly elevated. Its principal rivers are the Liftey and the Burrow, the latter of which in part forms its boundary. The Boyne has its source in K., sh has also the Discleviation. It is also traversed by the Grand and Royal Canals.
The most remarkable features of K. are the celerated plain called the 'Corragh of Kildare'—an undulating down, six miles long, and two broad, the site of the well-known race-course, the Newmarket of Ireland—and the Bog of Allen. The solitary hill site of the well-known race-course, the Newmarket of Ireland—and the Bog of Allen. The solitary hill called Allen, which rises through the great central limestone plain, is a mass of granniar, compact, greenstone and porphyry, with a portion of red sandstone conglomerate, which is quarried for millstones. The soil is generally a rich loam, resting on limestone or slate. The total extent of land on limestone or slate. The total extent of land under tillage, in 1853, was 140,837 acres; but since that date, the proportion of pasture-land to tillage has been much increased, the number of acres under crop in 1852 being only 133,001. The primary number of minor towns of considerable business is beyond the ordinary average of Irish counties. In the imperial parliament, K. has two county members. In antiquities of all the various historical periods, K. is peculiarly rich. In the time of Gerallus Cambrensis, the plain of the Curragh had a stone circle similar to that of Stonehenge. Of the round tower, there are no fewer than five

inhabited. The well-known Roman Catholic college of Maynooth (q. v.) is situated in this county, as is also the Jesuit college of Clongowis Wood.

KILIA, a fortified town of European Turkey, in the province of Bessarabia, is situated on the left bank of the Kilia branch of the Danube, 25 miles north-east of Ismail. Commerce is carried on here to some extent, and there is a population of 6400.

KI'LIAN, a saint of the Roman Catholic Church, and Bishop of Würzburg in the 7th century. He was a native of Ireland, and a member of that distinguished body of Irish missionaries among the Teutonic nations, to whose labours, in the 5th and 7th c., Christianity and civilisation were so largely indebted in the southern and south-eastern countries of Europe. He was of a noble family, and while yet young, entered the monastic life in his native Having undertaken, in company with several of his fellow-monks, a pilgrimage to Rome, he was seized in his journey through the still pagan province of Thuringia, with a desire to devote himself to its conversion, and being joined by his fellow-pilgrims, Colman and Donatus, he obtained for the project at Rome, in 687, the sanction of the then pope, Conon, by whom he was ordained On his return, he succeeded in converting the Duke Gosbert, with many of his subjects, and in opening the way for the complete conversion of Thuringia; but having provoked the enmity of Geilana, who, although the widow of Gosbert's brother, had been married to Gosbert, by declaring the marriage invalid, and inducing Gosbert to separate from her, he was murdered at her instigation, during the absence of Gosbert, in 789, together with both his fellow-missionaries. The work which K. commenced was completed some years later by Boniface and his fellow-missionaries.

KILIMANJARO' (the Great Mountain), supposed to be the highest known mountain of Africa, is situated on the western border of Zanzibar, in lat. 3° 40' S., and long. 36 E. It is covered with perpetual snow, and is supposed to reach an elevation of 20,000 feet above sea-level.

KILKE'NNY, CITY OF (Gæl. 'Church of St Kenny, or Canice'), the capital of the county of that name, and a county of itself, is situated on the river Nore, 81 miles south-south-west from Dublin by the Great Southern and Western Railway. Pop. in 1851, 19,975; in 1861, 14,081 (which shews a decrease of 5894), of whom 12,854 were Roman Catholics, 1084 Protestants of the Established Church, and the rest Protestants of other denominations. The county of the city comprises an area of 17,012 acres, of which 16,091 are external to the city. K. returns one member to the imperial parliament. This city owes its origin to the eather dral church of the diocese of Ossory, which dates from the 12th century. Almost from the time of the invasion, K. was a strong seat of the English power, its castle dating from the time of William, Earl of Pembroke, in 1195. From an early date, K. was a place of much political importance, as well as the scat of numerous religious establishments. Being seated on the southern frontier of the Pale, it was strongly walled in the end of the 14th c., and several parliaments were held in it, of which the most notable was that of 1367, in which was enacted the well-known 'Statute of Kilkenny,' the great nucleus of all the distinctively English legislation for Ireland. The cathedral dates in part from the 13th c.; and the abbey church of St John's, called the Black Abbey, has been partially restored, and is one of the very few ancient Irish churches now in etual occupation for the religious use of the Roman Catholics. A handsome Roman Catholic cathedral

also has been recently completed. The so-called college or grammar-school of K. was founded by the Butlers in the 16th c., and was further endowed by the great Duke of Ormond. St Kyran's College is an educational establishment for the Roman Catholics, and is interesting as one of the first opened by that religious community after the reneal of the law which made Catholic education penal in these countries. K. formerly possessed considerable manufactures of blankets and coarse woollen and linen cloths, but of late they have much declined. It is the seat of tolerably extensive marble-works, and has a large and active provision-trade, the chief outlet of which is Waterford, with which K. is connected both by river and by the Kilkenny and Waterford Railway,

KILKENNY, an inland county of the province of Leinster, in Ireland, bounded on the south by the county of Waterford, is 46 miles in its greatest length from north to south, and 24 in its greatest width from east to west. Its area is 791 square miles, or 506,333 acres, of which 96,569 are mountain and bog. The population in 1841 was 189,312; in 1851, 138,775; in 1861, it was 109,476, of whom 104,667 were Roman Catholies, 4597 Protestants of the Established Church, and the residue Protestants of other denominations. The smface of the county is very varied, the southern portion being especially elevated, the range of hills rising to a height of 1696 feet in the summit of Mount Brandon. In the western district are situated the so-called Walsh Mountains. The principal rivers are the Nore, which traverses the entire length from north to south-east, and falls into the Barrow; the Barrow, and Suir, which form the eastern and southern boundary. The surface of K., with the exception of the mountains in the south, is mainly occupied by the limestone formation, overlaid, in the northern districts, by shale and sandstone. In the hilly districts is an extensive deposit of anthracite coal, but of inferior quality. In the neighbourhood of the city of Kilkcuny, a valuable black marble, largely interspersed with fossil shells, is extensively quarried, and a considerable manufacture of chimney-pieces and similar objects is carried on. Marl is very generally found in large deposits throughout the county. The soil is generally fit for tillage. In 1862, the number of acres under crop was 182,751; a considerable portion, however, is devoted to pasture. The live-stock of the year 1860 was estimated at £949,107. The capital of K. is the city of the same name (q. v.). The capital of secondary importance are Callan, Thomastown, Freshford, Urlingford, and Castlecomer, which is the centre of the coal district. K. is represented in parliament by two county members, the city having a third member of its own. The county

several chambers encrusted with stalactites. It is KILLA'RNEY, a small market-town of Ireland, in the county of Kerry, Munster, is situated a mile

traversed by a subterranean stream.

of K. having been, from an early period after the invasion, the seat of the great Anglo-Norman families

of Fitzgerald, Butler, Grace, Purcell, and others, has

been the scene of much of the conflict of the Enge lish and Irish races. It is still thickly studded with the remains of the military strongholds of these

English settlers. The ecclesiastical remains are no

less numerous; and although not so rich in pagan

remains as other Irish counties, it possesses five round towers, and a considerable number of raths or

tumuli, cairus, stone-circles, and pillars. The most remarkable natural curiosity is the cave of Dunmore, between Castlecomer and Kilkenny, opening by a natural arch of 50 feet in height, and containing and a half from the Lower Lake of the same name, 17 miles south-east of Tralee, and 46 miles west-north-west of Cork. It contains an imposing Roman Catholic cathedral and a nunnery, has little trade, is exceedingly dull in winter, though it wakes up into animation in spring and summer. when it is visited by crowds of tourists, attracted by the oeauty of the scenery in the vicinity. Pop. 5187.

KILLARNEY, LAKES OF, a series of three connected lakes, near the centre of the county of Kerry, Ireland. The surplus waters are conveyed by the Ireland. The surplus waters are conveyed by the river Leane north-west to Castlemain Harbour. The Upper Lake is 2½ miles long and 2ths of a mile broad, and contains several islands. The Long Range River, leading to the Middle Lake, is about three miles in length. The Middle Lake is 2 miles long by 1 mile broad; and the Lower Lake, with about thirty islands, is 5 miles long by 3 broad. The beauty of the scenery, which is widely cele-brated, consists in the gracefulness of the mountain outlines, the rich and varied colouring of the wooded shores, deepening through gray rock and light-green arbutus to brown mountain heath and dark firs.

KILLIECRA'NKIE, BATTLE OF. See GRAHAM, JOHN, VISCOUNT DUNDER.

KILMAI'NHAM HOSPITAL, an establish-ment near Dublin for the reception of wounded and pensioned soldiers. It was originally founded by King Charles II., and is conducted on similar prin-Ming (Maries II., and is conducted on similar principles to the sister institution, Chelesa Hospital (q. v.). The estimated cost to the country of K. H. for the year 1862—1863 is £6395, and the number of in-pensioners provided for about 130. The general commanding the forces in Ireland for the time being is ex officio the master of K. H., and has his residence on the estate.

KILMA'RNOCK, the largest town in the county of Ayr, Scotland, and one of the chief stations on the Glasgow and South-Western Railway, is situated on a small stream of the same name, which soon after flows into the river Irvine, 12 miles north-north-east of Ayr. It is long and straggling, extending over a space of nearly two miles, but is, on the whole, well built. K. was once celebrated for its manufacture of 'cowls;' in the days of handloom-weaving, the 'Kilmarnock wabsters' were a notable class, and have received from the satiric pen of Burus a not altogether enviable immortality; but the introduction of machinery has reduced the class to insignificance. Later, the town became (and still continues to be) one of the most important seats of calico-printing in Scotland. It has also several large engineering establishments, woollen mills, tanneries, breweries, &c. The country round about is one of the richest in Scotland in coal and iron. K. is a parliamentary burgh, and unites with Rutherglen, Dumbarton, Port-Glasgow, and Renfrew in sending one member to parliament. Pop. (1861) 19.201.

KILOGRAMME, See GRAMME.

KILRU'SH, a small market and seaport town of Ireland, in the county of Clare, is situated on an inlet of the same name, on the northern shore of the estuary of the Shannon, 50 miles west of Limerick. It is much resorted to for sea-bathing, has a good harbour with secure anchorage from westerly gales, and carries on considerable trade in corn, butter, pigs, fish, feathers, hides, flags, Irish moss, and in turf cut in the vicinity. Stone and slate are quarried here, and there are manufactures of flaunels, friezes, and linen-sheetings. Pop. (1861)

Glasgow, with which it is connected by railway. There are here several factories, and coal and ironworks. Pop. (1861) 4692.

KILWTNNING, a small town in the county of Ayr, Scotland. It consists chiefly of one long, straggling, irregular street. Hand-loom weaving is carried on to some extent, and the place is also noted for its muslin embroidery, which gives employment to several hundred females; but the prosperity of the town depends mainly on the numerous coal-pits in its vicinity, and on its proximity to the Eglinton Ironworks, which alone afford employment to 1700 miners and others. The parish church, built in 1775, occupies part of the site of the famous Abbey of Kilwinning. The town is noted as being the birthplace of freemasonry in Scotland, and until the institution of the Grand Lodge in 1736, all other lodges in Scotland received their charters from 'Mother Kilwinning;' even after 1736, down to 1807, when the disputes between the two lodges were adjusted, many charters were issued by the mother-lodge. It is also celebrated for its archery, and is the only place in Scotland where shooting at the papingo is practised. Pop. in 1861, 3921. About a mile and a half to the south-east of the town, in the midst of extensive and heautiful policies, stands Eglinton Castle, the principal residence of the family of Montgomerie, Earls of Eglinton, and the scene of the renowned 'Tournament' in 1839.

KIMCHI, DAVID (generally quoted by his initials, ReDaK), the most eminent Jewish grammarian and exegete, was born towards the end of the 12th c., probably at Narbonne, where he speut the greater part of his life. He died in Provence about 1240. His father, Joseph Kimchi, was the author of a number of commentaries and other theological works. His brother Moses is renowned for works of a similar description, more especially a Hebrew Grammar, Mahalach Shebile ha-Daat, of which there oranimar, acanazion Specine na-Data, of which there are several editions. His own celebrity, however, far exceeds theirs. His Grammar, Michlol, and his Lexicon, Shorashim, have, to a certain degree, been Lexicon, Stortosum, nave, to a certain degree, been the basis of all subsequent Hebrew grammars and lexicons. He wrote also commentaries on almost all the books of the Old Testament, most of which have been separately printed, and translated into Latin by Neio, Pontaco, Leusden, Mins, Janvier, &c., besides several polemical works, such as the Vikuach, Teshuboth le-Nozrim, &c. He was also made arbiter in the great Maimonides controversy (1232).

KIMMERIDGE CLAY, the lowest series of the Upper Oolite, consists chiefly of a bituminous shale, in some places passing into an impure brown shaly coal, and in others having beds of sand or calcareous grit, with layers of nodules of septaria scattered through them. The series attains a maximum thickness of 500 or 600 feet. The beds occur in the vale of Pickering in Yorkshire, and continue as a narrow band south through Lincoln and Norfolk, then south-east through Huntingdon, Buckingham, and Wilts, to Dorset, where they terminate near Weymouth, and eastward at the village of Kimmeridge, which has given its name to the series. The fossils are chiefly mollusca, with a few placoid and ganoid fish, and several reptiles. In many places, layers of an oyster (Ostrea deltoidea), without any other organic remain, occur in broad continuous floors parallel to the stratification: the valves are usually together, and young specimens are occasionally attached to the older ones.

KIN, NEXT OF. When a person dies intestate, 4565.

Kilsy'TH, a burgh of barony in Stiriingshire, upon and belongs to the next of kin, who are the Sociand, is distant about 12 miles north-east from | blood-relatives of the deceased. The law has declared a certain order of precedence among next of kin, which is not exactly the same in the three kingdoms. The degrees of kindred are divided into lineal and collateral. The lineal consists of the ascending, such as father, mother, grandfather, grandmother, paternal and maternal, and so on ad infinium; and the descending, such as son, daughter, grandson, granddaughter, and se on ad infinium. The collateral kindred consists of brothers, sisters, uncles, aunts, and the children of such ad infini-tum. The mode by which the civil law computed the propinquity of degree was this; it allowed one degree for each person in the line of descent exclusively of him from whom the computation begins, and in the direct line counted the degrees from the deceased to his relative; but as regards collaterals, it counted the sum of the degrees from the deceased to the common ancestor, and from the common ancestor to the relatives. Thus, a brother was in the second degree, counting one to the father, and one from the father to the brother: a nephew. and alse an uncle, a great-grandfather and a great-grandson, were all in the third degree; a son and a father were in the first degree; and so on. This mode of computing the degrees of kindred has been adopted in the law of England and Ireland.

When a person dies intestate, leaving personal property, there are two classes of rights to which the next of kin are entitled: one is the right to administer the estate, or to take out letters of administration; the other is the right to a share of the property itself. As regards the right of administration, the widow or next of kin may be selected, both or either. But among the next of kin, those are to be preferred who are nearest in degree according to the above computation : thus, a son or father is preferred to a brother, grandfather, or grandson; and these to a nephew, uncle, great-grandson, or great-grandfather; and so on. As regards the more valuable right of a share in the property, the rule is, that if there is a widow surviving, and also issue of the deceased, who are in that case the next of kin, then two-thirds of the property go to the next of kin; if there are no issue, but a widow survives, then one-half only goes to the next of kin; but if there is no widow surviving, then the whole goes to the next of kin. But the next of kin take according to the statute of Distributions, which slightly differs from the order of the civil law as to the degrees of priority : thus, the children exclusively take the whole, if children survive; if some of the children are dead, leaving issue, then the issue collectively of each dead child take an equal share with the living children, by what is called the principle of Representation. If there are none nearer than grandchildren, all take an equal share, and the issue of a deceased grandchild also take one of such shares. After all the children and grandchildren are dead without issue, then the father, if alive, is entitled to the whole. If he also is dead, then the mother, the living brothers and sisters (together with the issue of deceased brothers and sisters collectively), take each one share. After these are dead, then grandfathers and grandmothers, paternal and maternal, and nephews and nieces, if alive, take each a share. The right of representation, i.e., the right of the children of a deceased person being one of a class and who, if alive, would have been one of the next of kin), to represent him, and take his share, applies as far as the children of brothers and sisters, but no further. The heir-at-law, if of equal degree, is one of the next of kin, and takes his share with the rest. though he also gets all the real estate. The half-blood counts among the next of kin equally with the whole blood.

In Scotland, the rules of priority among the next member to parliament,

of kin vary considerably from the above order, which prevails in England and Ireland. The children being entitled to an absolute legal share called Legitim (n. V.), take the father's property in two characters—one part as legitim, the other us being next of kin—and the result is often different from what obtains in England. Moreover, in Seatland, though the heir-at-law may be one of the next of kin, still he is not entitled to take such share unless the Collate (n. V.) the heirtable estate. The degrees of kindred are not counted in exactly the same way. The father never can take more than one-hali, nor the mother than one-third, while any of the brothers and sisters, or their issue, are alive. The half-blood does not share equally with, but in an inferior degree to the full blood.

KINA BALU, an interesting mountain in the northern angle of the island of Borneo, reaches a height of 13,000 feet. It was twice ascended by Mr Spenser St John, F.R.G.S., author of Life in the Forests of the Far East.

KINBURN, a small fort of South Russia, in the government of Kherson, is situated at the extremity of a long parrow sand-bank, which forms the southern boundary of the estuary of the Dnieper. During the Crimcan War, it fell before a naval expelition of the alies, October 17, 1835. About a mile from the fort stands the little fishing-village of Kinburn.

KINCA'RDINESHIRE, or THE MEARNS, a maritime county of Scotland, lying between the mouths of the Dee and the North Esk, immediately south of Aberdeenshire. Area, 243,444 acres, nearly sound of Adordershaffe. Area, 2-34,444 acres, nearly one half of which is under culture. The county may be divided into five sections; viz, the Coast, Garvock, the 'Howo' the Mearns,' the Grampians, and Deeside. The coast-land and a considerable part of the 'How' is of superior quality, and rents from £2 to £3, lue, an aere. The 'How' forms part of the Valley of Strathmore (q. v.). The Grampians, running across the county from east to west, parallel to the Dee, with an average breadth of from seven to eight miles, cover about 80,000 acres. One of the peaks, Mount Battock, on the top of which the three counties of Aberdeen, Kincardine, and Forfar meet, is 3500 feet high. The Deeside portion of the county is a comparatively narrow strip of light sharp soil. The rain-fall is from 23 to 27 inches. The produce of the county and the condition of the inhabitants have improved vastly since the middle of the 18th c., when there was little to be seen but poor huts and starved cattle, and when the value of the largest ox of four or five years old, weighing 30 imperial stone, was not more than 20s. In 1857, there were 4084 acres of wheat, averaging 29 bushels 34 peeks; 8802 acres barley, averaging 33 bushels 3 peeks; 28,174 acres outs, averaging 37 bushels; 17,691 acres turnips, averaging 14 tons 3 cwts.; 2555 acres potatoes, averaging 2 tons 19 ewts. Of livestock there were 4553 horses, 28,180 cattle, 25,110 sheep, and 3656 swine. There are few manufactures in the county. The principal towns and villages are Stonehaven (q.v.), the county town; Bervie, a royal burgh; Lawrencekirk, a burgh of barony; and Johnshaven. In the beginning of the 19th c., about 1 in 50 of the population was on the poor-roll, the average expenditure for each being £1, 16s.; at present there is 1 pauper in 26, and the average allowance to each is £4, 10s. Of the objects of allowance to cace is 24, 10%. Of the objects of antiquarian interest, the most noted is Dunnottar Castle (q, v). K. was the birthplace of George Wishart, Robert Barclay, Bishop Burnett, Dr. Beattie, and Dr Thomas Reid. The pop in 1861 was 34,466; constituency 1019, who return one

KING (Saxon, Cyning; Sanserit, Ganaka, father, ron the root Gan, to beget: what the husband was in his house, the lord, the strong protector, the king was among his people—Max Müller), the person vested with supreme power in a state. According to feudal usages, the king was the source from which all command, honour, and authority flowed; and he delegated to his followers the power by which they exercised subordinate rule in certain districts. The kingdom was divided into separate baronies, in each of which a haron ruled, lord both of the lands, which he held under the obligation of rendering military service to the king, and in many cases also of the people, who were vassals of the soil, and his liege subjects. In modern times, the kingly power often represents only a limited mea-sure of sovereignty, various constitutional checks being in operation in different countries to control the royal prerogative. The king may succeed to the throne by descent or inheritance, or he may be elected by the suffrages of the nation, or by the suffrages of some body of persons selected out of the nation, as was the case in Poland. Even when the kingly power is hereditary, some form is gone through on the accession of a new king, to signify a recognition by the people of his right, and a claim that he should pledge himself to perform certain duties, accompanied by a religious ceremony, in which anoiuting with oil and placing a crown on his bead are included as acts. By the anointing, a certain sacredness is supposed to be anoming, a cercain sacreeness is supposed to be thrown round the royal person, while the coronation symbolises his supremacy. There is now no very clearly marked distinction between a king and an Emperor (q. v.). A queen-regnant, or princess who has inherited the sovereign power in countries where female succession to the throne is recognised, possesses all the political rights of a king.

In England, it is said that the king never dies, which means, that he succeeds to the throne immediately on the death of his predecessor, without the necessity of previous recognition on the part of the people. He makes oath at his coronation to govern according to law, to cause justice to be administered, and to maintain the Protestant Church. He is the source from which all hereditary titles are derived, and he nominates judges and other officers of state, officers of the army and navy, governors of colonies, bishops and deans. He must concur in every legislative enactment, and sends embassies, makes treaties, and even enters into wars, without consulting parliament. The royal person is sacred, and the king cannot be called to account for any of his acts; but he can only act politically by his ministers, who are not protected by the same irresponsibility. A further control on the royal prerogative is exercised by the continual necessity of applying to parliament for supplies of money, which practically renders it necessary to obtain the sanction of that body to every important public

The Crown (q. v.) now in use as the emblem of sovereignty differs considerably in form in different countries of modern Europe; but in all cases it is distinguished from the coronets of the nobility in being closed above. The royal crown of Great Britain, here

Crown of represented, is described under article Great Britain. Crown. The helmet placed by the sovereign over his arms is of burnished gold, open-faced, and with bars. For the arms of the sovereign, see GREAT BRITAIN.

KING-AT-ARMS, or KING-OF-ARMS. The king of the heralds, a title exchanged for king-of- and surmounted by a tassel wrought of gold silk.

arms about the reign of Henry IV. There are four kings-at-arms in England, named respectively Garter, Clarencieux, Norroy, and Bath, but the first three only are members of the College of Arms.

Garter principal king-of-arms was instituted by Henry V., 1417 A.D., for the service of the order of the Garter, which had previously been attended by Windsor herald. He was also made chief of the heralds, and empowered to grant arms, to assign supporters to new peers and knights of the Bath, and to administer the oath to inferior officers of arms, besides performing many other duties con-nected with the order, and public ceremonies in general. It is necessary that he should himself be ao Englishman and gentleman of coat-armour. In the capacity of king-of-arms of the order of the Garter, he has apartments within the castle of Windsor, and a mantle of blue satin, with the arms of St George on the left shoulder, besides a badge and sceptre. His official costume as principal kingand sceptre. His official costume as principal king-of-arms of England is a succoat of velvet, richly embroidered with the arms of the sovereign, a crown, and a collar of SS. The insignia of the office are borne by Garter impaled with his paternal arms, the latter on the dexter side of the shield. These are argent, St George's cross, on a chief gules a ducal coronet encircled with a garter, between a lion of England on the dexter side, and

of the delis on the sinister, all or the deater stag and a flear-de-lis on the sinister, all or. Clarencieux and Norroy are called provincial kings-of-arus. Clarencieux takes precedence of Norroy. He has a crown, collar of SS, and surcoat, like those worn by Garter. The insignia of his office are argent St George's cross, on a chief gules

a lion of England ducally crowned or.

Norroy, though he yields precedence to the others, is the most aucient of the kings-of-arms. The name first occurs in the reign of Edward II., when he is called Roy des armes des Norroys, a word used for northmen. His official arms are argent St George's cross, on a chief per pale azure and gules a lion of England ducally crowned between a fleur-de-lis on the dexter side, and a key, wards in chief, on the

sinister, all or.

Bath king-of-arms, though not a member of the college, takes precedence next after Garter. His office was created in 1725 for the service of the order of the Bath. On the 14th January 1726, he was constituted Gloucester King-of-arms (an office originally created by Richard III., in whose reign it also became extinct), and principal herald of Wales. He was at the same time empowered, either alone, or jointly with Garter, to grant arms to persons residing within the Principality. The chief heraldic officer for Scotland is called

Lyon King-of-arms (q. v.), who since the Union has ranked next to Garter. His title is derived from the lion rampant in the Scottish royal insignia

There is one king-of-arms in Ireland, named lster. In the 14th c., there existed a king-of-arms called Ireland, but the office seems to have become extinct, and Edward VI. created Ulster to supply the deficiency. His arms are argent, St George's cross, upon a chief gules a lion between a harp and a portcullis, all or. The royal ordinance relative to the order of St Patrick, issued 17th May 1833, declares that in all ceremonials and assemblies Ulster King-of-arms shall have place immediately after the Lyon.

The crown of a king-of-arms is of silver gilt, and consists of a circle inscribed with the words, Miserere mei Deus secundum magnam misericordiam tuam, supporting 16 oak leaves, each alternate leaf higher than the rest. Within the crown is principal herald of England was at first designated a cap of crimson satin turned up with ermine,

Kingsof-arms were formerly entitled to wear their crowns on all occasions when the sovereign wore his; now they assume them only when peers put on their cronnets. The installation of kings-at-arms anciently took place with great state, and always on a Sunday or festival-alsy, the ceremony being performed by the king, the earl-marshal, or some other person duly appointed by royal warrant.

KING-CRAB (Limulus), a genus of Crustacea, ranked by Cuvier among the Entomostraca; but so widely differing from all the rest of the Crustacea, that Milne-Edwards makes it a sub-class by itself.

Aling-Crab (Limitus
Polyphemus):
Copied from English Cyclopadia
a, position of the two smooth
eyes; b, b, lateral composite
eyes; c, c, respiratory apertures.

feed on animal food; and are said to be themselves less agreeable food than crabs or lobsters. Some of them exceed two feet in length, and the strong and jugged spine is a formidable weapon. In some of the Asiatic islands, the spine is often used for pointing arrows. In tropical America, the K. is called Caserrole Fish, of species of K. is not great. Fossil species are pretly numerous. Trillohites are supposed to have been allied to the Linuit.

of tropical Asia, the

Asiatic Archipelago, and tropical America. They

KINGFISHER (Alcedo), a genus of birds of the order Inscesores, and family Halcyonide. The name

Kingfisher (Alcedo ispida).

is often extended to the whole family; the only British and almost the only European species of which is the European K. (A. ispida), a bird not much larger than a sparrow, in brilliancy of colour

rivalling the finest tropical birds—blue and green being the prevailing colours. The K. is generally distributed over Britain and Ireland, but is not a common in Scotland. It is not a bird of passage, although in many places it appears only as an occasional visitant. It is found in all parts of Europe except the most nothern, and over a great part of Asia and Africa. It frequents the banks of rivers and streams, and is often seen flying near the sursuch as minutews, sticklestesk, and trout or salmon fry, and of leeches and water-insects. When it has caught a fish, it often kills it by beating on a branch, and always swallows it head foremost. The indigestible parts are afterwards diagonged.

It seems probable, although not quite certain, that the K. is the Holgono of the ancients, about which many wonderful fables were current among them; of its having power to quell storms, of its floating next, and the stillness of the winds during the time necessary for its safety, &c. Shakspean makes repeated allusion to the popular notion, that if the stuffed skin of a K. or Haleyon is hung up to a thread, the bill will always point to the

direction from which the wind blows.

The BELTER K. (Jetedo Hudegon or Ceryle
Hudegon) of North America is a much larger bird
than the K. of Britain, being fully twelve inches in
length. It is common on most of the rivers of
North America, to the 67° N. lat. in summer, but
migrates southward in winder, and is then to be
found in the West Indies. Its colours are dull
when compared with those of the European king-

Many species of K. are found in the warmer parts of the world. Some of them, forming the genus Cegar, want the hind toe. The common European K. may be regarded as the type of the family, which belongs to the group called Syndrotyle Birds, and is characterised by the much-united toss. The form is characterised by the much-united toss. The form the bill, being straight, quadrangular, sharp, heron, like bill, being straight, quadrangular, sharp, heron, like bill, being straight, quadrangular, sharp, heron, like bill, some parts of the parts of the

KING GEORGE'S SOUND, an inlet of the Indian Ocean, at the south-west angle of Australia. Independently of an excellent roadstead, it contains two landlecked recesses, Princess Royal and Oyster Harbours. The entrance is in lat. 35° 6° S., and long. 118° 1° E.

KINGLAKE, ALEXANDER WILLIAM, was born at Taunton, Somersetshire, in 1802, studied at Eton and Trinity College, Cambridge, and-having chosen the law as a profession - was called to the bar in 1837. His practice soon became very great; never-theless, he found time to make a tour in the east of some length, the result of which was a book entitled Eothen, descriptive of his adventures and impressions. It was published in 1844, and at once attained an astonishing popularity, passing through many editions both in England and America, and being also extensively translated on the continent. The graceful vigour and liveliness of the style have made Eothen a model for subsequent works of a similar kind, but none have yet reached the exquisite talent of the original. In 1857, K. entered parliament as member for Bridgewater. His Invasion of the Crimea, its Origin and Progress, in two vols., appeared in 1863-1868, and fully sustained the literary reputation of their author; but the virulent antipathy shewn towards the French emperor and all the actors in the coup d'état is thought to have incapacitated K. from giving a true account of the war, its causes, and the men who were prominent in it.

KINGPOST. See ROOF.

KINGWOOD, a very beautiful wood, in small pieces, used for ornamental work. It is brought from Brazil, and is believed to be the wood of a species of *Triptolomia* (nat. ord. *Leguminosæ*, subord. Papilionacea).

KINGS, BOOKS OF (Melakim), the name given to two of the canonical books of the Old Testament. Originally, they were but one, and were first separated by the Seventy, by whom they are designated 'the third and fourth of the kingdoms'—the Books of Samuel forming the first and second. This division was copied by the Vulgate, and passed thence into the general usage of Christendom. The exact titles of these books in the English Authorised Version are—The First Book of the Kings, commonly version are—Ine First Book of the Kings, commonly called the Third Book of the Kings, and The Second Book of the Kings, commonly called the Fourth Book of the Kings. They embrace (1) the reign of Solumon, (2) the history of the divided kingdoms of Judah and Israel, (3) the history of the kingdom of Judah and Israel, (3) the history of the kingdom of Judah after the dispersion of Israel, until the Babylonian captivity—a period of about 570 years in all. The books do not appear to be merely vague compilations from royal annals and other-rather contradictory-sources, as is held by some, but rather the diligent work of a historian-with a clear and distinct tendency-who gathered together all the written and unwritten information, provided it could be made useful for his purpose. The unity it could be made useful for his purpose. The unity of style and language is indeed palpable through-out, nor are any later alterations of consequence out, nor are any later arterations of consequence apparent. The principal sources quoted are a Book [of the Chronicles] of Solomon, further a Book of the Chronicles of the Kings of Israel, and another of the Kings of Judah. The Talmud, and some of the earlier Christian theologians, ascribe it to Jeremiah; this view is also maintained by Hävernick in modern times. Huet and Calmet are in favour of Ezra, but all that can be safely asserted is, that the compiler lived during the second half of the Captivity, and after the death of Joiachin, and probably in Babylon. The spirit of the work is theocratico-prophetic in a high degree (its historical fidelity with respect to the political events is generally recognised, but the stories relating to the prophets Elijah and Elisha are by most critics referred to the province of legend); while that of Chronicles (which goes over much the same ground) is held to betray the predominance of priestly influence. One of the best modern commentaries is that by Thenius (Leip. 1845).

KING'S BENCH. See QUEEN'S BENCH.

KING'S COLLEGE, Cambridge, was founded in 1441 by Henry VI., for a provest, seventy fellows and scholars, three chaptains, with clerks, choris-ters, servitors, and poor scholars—in all, 140. Its revenues were seriously diminished by Edward IV. revenues were seriously diminished by Edward IV.
The chapel is the work of the three Henries, VI.,
VII., VIII. The architect is supposed to have
been Nicholas Cloos, or Klans, Fellow of the
college, and Bishop of Lichfield, or, as others say,
his father. It is perhaps the finest specimen of
perpendicular Gothe in the world. Its internal
dimensions are 200 feet long, 45 wide, and 75 high. There is an inner roof of stone, which, though of enormously massive structure, has, from its proenormously massive structure, has, from its pro-portions, and the beauty of the groning, the most airy and pleasing effect. Under the new statutes, which were given in 1801, the foundation will consist of forty-six fellows, and not less than forty-eight scholars, governed by a provest. Twenty-four of the scholarships will be appropriated to the scholars of Eton College. The follows under the new statutes will be elected from all members of the college who are of sufficient standing.—See Fuller's University of Cambridge and Cooper's Memorials.

KING'S COLLEGE, London, a proprietary institution occupying the east wing of Somerset House, and founded in 1828 on the fundamental principle:—'that instruction in the Christian religion ought to form an indispensable part of every goon ought to form an indispensable part of every system of general education for the youth of a Christian community. The college being strictly in connection with the Church of England, church in connection with the Univers of England, church service is a regular part of its routine. The course embraces theology, general literature and science, applied sciences, and medicine. A limited number of matriculated students reside within the walls. of matriculated students reside within the waits.

The miscum contains the calculating-machine of
Mr Babbage, and George IIL's collection of
mechanical models and philosophical instruments,
the latter presented by the Queen. There is a
school in connection with the college.

KING'S or QUEEN'S COUNSEL are certain harristers at law, in England and Ireland, who have been appointed by letters-patent to be her Majesty's Counsel. The office is entirely honorary. but it gives a right of preaudience in all the courts, according to the date of appointment. The appointment practically belongs to the Lord Chancellor. Though called her Majesty's Counsel, they are not prevented from being retained and acting for ordinary clients, except that in defending prisoners and acting in suits against the crown, they require a special licence from the crown, which, is however, never refused. In Scotland, there is no distinction of Queen's Counsel, but the Lord Advocate and Solicitor-general are so in reality. The appoint-ment of Queen's Counsel is for life, but in case of disgraceful conduct, the letters-patent are revoked, as was recently done in reference to Edwin James. an English barrister.

KING'S COUNTY, one of the inland counties of Ireland, is bounded on the E by the county of Kildare, and on the W. by the river Shannon, which separates it from Roscommon and Galway. Area, 493,985 statute acres, of which 337,256 are arable and 8258 in plantations. In 1862, 127,795 acres were under crops, and 1761 acres were lying fallow. Pop. (1851) 112,076; (1861) 90,013. The surface is in general flat; it includes, however, in the south, a portion of the Slieve Bloom Mountains, from which a line of low limestone hills extends north-east through the centre of the county, form-ing a water-shed between the basin of the Shannon on the west, and those of the Boyne and Barrow on the east. The soil, a light loam of medium depth, resting on limestone gravel, is of average fertility. The Bog of Allen (q. v.) extends from west to east the whole length of the county. The Grand Canal, reaching from Dublin almost entirely across the country, traverses the north portion of this county. Notwithstanding the great tracts of bog that occur here, the climate is not unhealthy. Two members are returned to the imperial parliament for the county.

In the north-west of this county are the ruins of the abbey Clonmacnoise, founded in 548, exceedingly rich in ancient monumental remains, and forming one of the most interesting of those ruined ecclesiastical structures in which Ireland is so rich. The county contains also many other religious foundations, as well as numerous feudal castles, chiefly of the Elizabethan period, and some of them still inhabited.

KING'S EVIDENCE (or Queen's), the name given to a person, who, having been an accomplice in some crime, has confessed, and offered to give evidence, and make full confession. The usual practice of the crown, in such cases, is to pardon the person so acting, though he is not absolutely entitled to a pardon; and an application is generally made to the judge, to admit the party as a witness, on the trial of the fellow-criminals. A similar practice exists in Scotland, the public prosecutor having the power and discretion to admit the confessing party.

KING'S EVIL. See SCROFULA.

KING'S LYNN. See LYNN.

KING'S SILVER, an ancient fine paid to the king, in the Court of Common Pleas in England, on alienation of certain lands.

KING'S YELLOW is the term applied to a pigment which is a mixture of orpinent (tersulphide of arsenic) and arsenious acid.

KINGSLEY, REV. CHARLES, was born at Holne Vicarage, Devoushire, 12th June 1819. He entered Magdalen College, Cambridge, in 1840, where he highly distinguished himself in classics and mathematics. In 1844, he became curate, and shortly never, rector of Eversley, in Hampshire. In the same year, he published Village Sermons, characterised as honest, downright wisdom, conveyed in a plain and simple style. In 1848, appeared The Saint's Tragely, or the True Story of Elizabeth of Hungary, an admirable and truly catholic representation of medieval piety. The next two or three years of his life were devoted -in company with his friend Mr Maurice and others-to a series of efforts for the amelioration and christianisation of the working-classes. To these efforts may be traced the origin of those co-operative associations in which the workmen are also the masters, the results of which have proved in every way beneficial. His opinions on the social anarchy of modern times are to be found in his Alton Locke, Tailor and Poet (1849), a novel of extraordinary power and fascination, the hero of which is sought for in a London workshop. This was followed, in 1851, by Yeast, a Problem, in which K. handles, among other questions, the condition of the English agricultural labourer; and in 1853, by Hapatia, or New Foes with an Old Face, a most vigorous and brilliant delineation of Christianity in conflict with rude Gothic paganism and the expiring philosophy of Greece, in the early part of the 5th century. Both of these works appeared in Fraser's Magazine. Two years after, he published West-ward Ho! or the Voyages and Adventures of Sir Amyas Leigh, Knt., in the Reign of Queen Elizabeth, probably the greatest of his works. Its glowing pictures of South American forests are said to have excited the admiration of Humboldt, who had himself really seen what K. only imagined. His other works are—Message of the Church to Labouring Men; Sermons on National Subjects, preached in a Village Church; Phaethon, or Loose Thoughts for Louse Thinkers; Alexandria and her Schools; Sermons for the Times; Glaucus, or the Wonders of the Shore; The Heroes, or Greek Fairy Tales; Waterbabies in 1863, and Hereward in 1866. He lectured at the Royal Institution in 1866 on Superstition and Science, and on the Ancient Regime in 1867, and was made a Canon of Chester in 1869.

KINGSTON, chief town of the united counties of Frontenac, Lennox, and Addington, province of Onon the north shore of Lake Ontario, at the mouth of the Cataraqui and of the Bay of Quinté, where the waters of the Canadian lakes issue into the St Lawrence. It is distant from Montreal 198 miles; from Toronto, 165; and from New York, 274. A rally oppressive on the immediate margin of the gathering-place of old to the neighbouring Indian bay, becomes gradually mitigated towards the tribes, occupied by a French fort from 1673 till head of the sloping streets, which rise into the

1758, it began to be settled by the British about 1783, was laid out in 1793, was incorporated as a town in IS38, and as a city in 1846. On the union of the two Canadas, the seat of government was established at K. in 1840, but was removed again in 1845. The city has, in consequence, grown more slowly than many others in the New World, but it numbers already among its buildings some of the finest in Canada. Its harbour, sheltered by Wolfe and Garden Islands, which lie two or three miles off, lined with a row of about twenty wharfs, turnished with a grain-elevator capable of unloading 3000 bushels per hour, is always busy, while navigation is open, especially with the transhipment of cargoes between the vessels which ply on the lakes and those of the St Lawrence and the Rideau Canal. The ship-building of K. is second in Canada only to that of Quebec. There are five foundries in the city, besides werks for the manufacture of engines, locomotive and stationary, of agricultural implements, edge-tools, axles, nails, &c.; and it is estimated that these altogether turn out about 9900 tons of finished iron a year. Besides its outlets by water, K. communicates with all parts of the country by the Grand Trunk Railway, which passes within two miles of the city, and is now (1863) connected with it by a branch-line. Next to Quebec and Halifax, K. is the most important military position in British America. Queen's University and College at K., incorporated by royal charter in 1841, for the education of a Presbyterian ministry, has since instituted the additional faculties of Law and Medicine, is now equipped with 17 professors and lecturers, and attended by an average of 150 students. There are also a Roman Catholic institution, called Regiopolis Coilege, the county grammar-school, and the common schools, besides several private academies. In 1862, K. became the seat of the new English bishopric of Outario. Its population in 1861 was 13,743, who return one member to the provincial parliament. The value of the exports from K. to the United States in 1868 was \$2,298,366, chiefly lumber and barley. The average, from 1855 to 1862, exports, £82,704; imports, £464,-604; duties collected, £19,210 sterling.

KINGSTON, a township and village of New York, U.S., situated on the west bank of the Hudson River, at the terminus of the Delaware and Hudson Canal, 57 miles below Albany. The township contains 3 villages, 18 churches, 3 banks, 4 newspaper offices, and has a large commerce in coal, stone, ice, lime, and cement. The village was burned in 1777 by Sir Henry Clinton. Pop. (1860) 16.640.

KINGSTON, the commercial capital of Jamaica (q. v.), stands on the north side of a landlocked harbour, the best in the island, and, for its size, one of the best in the world. It was founded in 1693, after the neighbouring town of Port Royal had been destroyed by an carthquake. From this place, afterwards rebuilt, it is separated by its noble haven; while with Spanish Town, towards the interior, it has, since 1846, been connected by a railway of about 10 miles in length. K. contains about 32,000 inhabitants. Though the city, as a whole, is like the generality of mere seaports, filthy and disorderly, it yet presents several handsome features. A large square, called the Parade, contains spacious barracks, a Wesleyan chapel, a theatre, and some tolerable dwelling-houses. The negro market for fruits and vegetables is described as a lively and interesting scene. The temperature, which is genefrom K. to the United States amounted to \$185,-

KINGSTON, or KINGSTOWN, capital of the British island of St Vincent, in the West Indies, stands on the south-west coast, with a population of about 5000.

KINGSTON-ON-HULL. See HULL

KINGSTON - UPON - THAMES, a municipal borough and market-town of England, in the county of Surrey, is situated 13 miles south-west of London, on the right bank of the Thames, here crossed by two handsome bridges, one of stone, and the other an iron viaduct of the Kingston-upon-Thames Extension Branch of the London and South-Western Railway. The county spring assizes are held in Kingston-upon-Thames. Educational and benevolent institutions are numerous; there are flour, cocca-nut fibre, and oil mills, and brick and tile works. Pop. (1861) 16.123. Around the Kineston-upon-Thames Station, on the main line of the London and South-Western Railway, distant about a mile, has grown up, since 1838, the elegant suburb of New Kingston or Surbiton, now almost joined to the town. In the neighbourhood are Hampton Court Palace, and Bushy and Richmond

Numerous Roman remains have been discovered in the vicinity of K., and during the Saxon period it had already risen into importance. Here, in 838, a great council was held under Egbert of Wessex and Ethelwolf of Kent, and a treaty agreed to; and here also seven of the Anglo-Saxon kings were crowned. The name is said to be derived from the stone on which the ceremony was per-formed, which stands in one of the streets, enclosed

by a railing.

KINGSTOWN, a thriving and important seaport of Ireland, on the southern shore of Duhlin Bay, six miles south-east of the city of that name. Previous to 1817, when the new and splendid harbour-works were commenced, it was merely a fishing-village. On occasion of the visit of George IV. to this town in September 1821, its former name, Dualeary, was changed to Kingstown. The harbour embraces an area of 250 acres, with a depth of water varying from 13 to 27 feet. The pleasing situation of the town, and the invigorating air, have made K. an important watering-place. The Dublin Royal Mail steam-packets sail from K. to Holyhead twice a day, and there is regular communication by steamer between it and the principal Irish and British sea-ports. Coal, iron, and timber are imported, and cattle, corn, lead ore, and granite, are exported. In 1861, 1442 vessels of 216,274 tons anchored in the harbour. Pop. 11,584.

RI'NIC or QUINIC ACID (C7H12O0) is an acid existing in the bark of the cinchonas, the leaves of the coffee tree, helly, maté, and many ericaceons plants,

KINK, a twist in a rope or cord, caused by the tightness of the coil, and a relaxation of pressure in the direction of its length. The best rope, however, rarely kinks.

KINKAJOU (Cercoleptes candivolvulus), a quadruped of the family Ursida, and allied to the racoons and coatis. By some naturalists it is referred to Viverridæ. It has six incisors, one canine tooth, and five molars in each jaw, the three hinder molars tuberculous. The K. is larger than a pole-cat, has 800

region of the sea-breezes. Most of the trade of some countries called Honey Bear. It is a native of Jamaica passes through K. In 1868 the exports the warm parts of America. The negroes have

Kinkajon (Cercoleptes candivolvulus).

transferred to it the name Potto, from a lemurine animal of Africa. It is easily tamed.

KINKEL, JOHANN GOTTFRIED, a German author. born at Oberkassel, 11th August 1815. He studied theology at Bonn, and was for some time a distinguished Protestant preacher; but becoming involved in the revolutionary movements of 1848, he was imprisoned in the fortress of Spandau, whence, however, he escaped. K. then went to America, but soon ever, he escaped. A. then went to has since resided after returned to England, where he has since resided as a public teacher. Both as a poet and as a writer on art, K. holds a distinguished rank. His principal works are—Predigten über ausgewählte Gleichnisse und Bildraden Christi (Cologue, 1842); Gedichte (Stutt. 1843); Otto der Schütz, eine Rhein. Geschichte in zwölf Abenteuern (Stutt. 1843, 9th edit. 1852), a wery beautiful narrative poem; Die Altehristliche Kunst (Bonn, 1845), which forms the first part of a still unfinished Geschichte der bildenden Künste bei den Christlichen Völkern; Die Ahr, Landschaft, Geschichte und Volksleben (Bonn, 1846); Nimrod, ein Trauerspiel (Hamb. 1857).—K.'s wife, Johanna K., a distinguished musician, has written Acht Briefe über den Clavierunterricht (Stutt. 1849); and together with her husband, Erzählungen (Statt. 1849). After her death (in 1859) appeared her novel, Hans Ibeles in London (Statt. 1860).

KINNAI'RD'S HEAD, a promontory with a light-house, on the north-east coast of Aberdeenshire, Scotland, near Fraserburgh, in lat. 57° 42' N., long. 2° W.

KI'NO, an astringent substance, resembling CATECHU (q. v.) and GAMBIR (q. v.), the concrete exudation of certain tropical trees, especially of Pterocarpus marsupium, a native of the mountains of Coromandel, which yields EAST INDIAN K., and of P. erinaceus, a native of Gambia, which yields AFRICAN KINO. The genus Pterocarpus belongs to the natural order Leguminoses, sub-order Papilon-acea, and has a 5-toothed calyx, and an irregular, nearly orbicular one-seeded pod, surrounded with

a wing.

East Indian K. is the kind which now chiefly occurs in commerce, and is the ordinary K. or gum kino of the shops. It is in small angular a yellowish woolly fur, climbs trees, feeds on fruits, distening fragments, the smaller reddish, the larger honcy, &c., as well as on small animals, and from almost black. Thin pieces are ruby red. It is ravages among the nests of wild-bees, is in brittle and easily powdered, has no smell, but has a very astringent taste. BENGAL K. is a similar astringent substance, produced by Butea frondosa. See BUTEA. It has been found capable of the medicinal uses of true kino. Botany Bay K. is the produce of Eucalyptus resinifera. See Eucalyptus

The astringency of kino is mainly due to its containing tannie and catechuje acid, and in consequence of this property, it is employed in medicine in certain forms of diarrhea (especially when a flux scems to be kept up by want of tone in the intestinal capillaries), the best mode of prescribing it being as compound kino powder, which is a mixture of kino, cinnamon, and opium, and the dose for an adult ranging from ten grains to a scruple. There is also a tincture of kino, which, when properly diluted with water, forms an excellent gargle for relaxation of the uvula.

Kino is employed to a considerable extent in the East Indies as a cotton dve, giving to the cotton the yellowish-brown colour known as nankeen.

KINRO'SS-SHIRE, after Clackmannanshire, the smallest county of Scotland, lies between the counties of Perth and Fife. Area, 49,812 acres; pop. (1861) 7977. It is 12 miles in length from east to west, and about 10 miles in breadth. Of its entire area, 30,000 acres are arable, 3000 in wood, and 4500 under water. See Loch Leven. Its surface is elevated and gently undulating; its boundaries are hilly, with occasional level openings. On the north and north-west are the Ochil Hills; on the north-east, the Lomonds; and on the south-east and south, Benarty and the Cleish Hills. The streams flow into Loch Leven (q. v.), and issue by clavev in the districts north and west of the loch. Excellent pasture occurs on the moorlands. For the year 1857, the average produce per imperial acre was—wheat, 26 bushels; barley, 31 bushels; oats, 36 bushels 31 pecks; bere, 31 bushels I peck; beans and pease, 9 bushels 1 peck; turnips, 15 tons 4 cwts.; potatoes, 1 ton 10 cwts. This county unites with that of Clackmannan, and with portions of Perthshire, in sending a member to parliament. The capital of the county is the town of Kinross. with a population (1861) of 2083, who are employed chiefly in the weaving of tartan shawls, and in

KINSALE, a municipal and parliamentary borough and seaport of Ireland, in the county of Cork, is at the head of Kinsale harbour, which is formed by the estuary of the river Bandon, fourteen miles south-south-west of Cork. A railway to Cork was opened here on the 16th May 1863, and the foundation-stone of a large marine hotel, with floating baths attached, was laid on the same day. The harbour, which is landlocked, is about two miles long, half a mile in average breadth, and is capable of containing 300 ships. K. exports agricultural produce, and imports coal, iron, and timber; its trade, however, owing to the neighbourhood of Cork, is small. Valuable fisheries, estimated at £500 per week in value, are carried on in the district. On the Old Head of Kinsale, a promontory stretching southward into the Atlantic, is a light-house, seen from a distance of twenty-three nantical miles. Pop. (1862) 4580.

KINTY RE. See CANTIRE.

KIO'LEN, or KJOLEN, an extensive plateau in Scandinavia (q. v.).

KIO'SK, a small ornamental pavilion, much used in India in the decoration of the tombs, ghats, dams, and other works. It consists of a dome, sup-ported on four or more detached columns, the space under the dome being left open, like the open niches under canopies in Gothic architecture. 259

KIPTCHA'K, or KEPTCHAK, a term which, in the middle ages, designated that vast territory stretching, north of the Caspian Sea, from the Don to Turkestan, and occupied by the Kumans and Polovises. This tract formed one of the four empires into which the huge dominion of Genghis the state of the following the portion of bis eldest son Jújy, under whose son and successor, Batû Khan, it became the terror of Western Europe, and held Russia in iron subjection from 1236 till 1362. Batû also conquered Bulgaria, and invaded Hungary, Austria, and Eastern Germany, but made no permanent conquests in this direction. This extensive empire was dismembered towards the end of the 15th e., and gave rise to the khanats of Kazan, Astrakhan, and Krim-Tartary. The Mongols of K. were also known as the 'Golden Horde,' Ruins of villages are to be seen in many places, especially near the Volga, and have been visited and described by Pallas, Klaproth, Gobel, &c. They no doubt partly belong to the era of the K. empire, but many are of more ancient date.

KIRATARJUNIYA, the name of one of the eelebrated poems of Sanserit literature. Its author is Bhâravi, and its principal subject is the conflict of Arjuna with the god Siva in his disguise of a Kirata, or mountaineer.

KIRBY, REV. WILLIAM, an eminent English naturalist, was born at Witnesham Hall, Suffolk, 19th September 1759. He was educated at Cains College, Cambridge, and was afterwards appointed Conege, Camoringe, and was atterwards appointed to the curacy of Barham, which he held for fourteen years, when he was preferred to the rectory. This office he held until his death, which happened on the 4th of July 1850, when he had nearly reached the great age of 91. His principal works are Monographia Apum Anglio (Ipswich, 1802), and Introduction to Entomology (4 vols. 1817-1826), published conjointly with Mr The first was very favourably received both at home and abroad, and at once secured for K. a distinguished place among European savants. The second work is written in the form of letters. and was and still is remarkably popular. K. also contributed a variety of very important entomo-logical papers to the Linnean Transactions. His greatest discovery in this department of science is that of the genus Stylops—the type of a new order of insects, living for a time parasitically in the bodies of bees. He also wrote one of the Bridgewater Treatises, entitled Habits and Instincts of Animals. K. was one of the first members of the Linnæan Society (founded in 1788), honorary president of the Entomological Society (founded in 1833), and Fellow of the Royal and Geological Societies.

KI'RCHENTAG, an association of ministers and laymen of the Lutheran, German Reformed, United Evangelical, and Moravian Churches in Germany, for the promotion of the interests of religion, without reference to their denominational differences, It holds an annual meeting; the place of which is changed from year to year. The first meeting took changed from year to year. place in 1848, at Wittenberg, in the church to which Luther affixed his theses. Its discussions and resolutions have exercised a considerable influence

KIRGHI'S, or KIRGHIS-KAISAKI, or COSSACKS OF THE STEPPEN, a people spread over the immense territory bounded by the Volga, desert of Obsh-tchei (in 55° N. lat.), the Irtish, Chinese Turkestan, Ala-Tau Mountains, the Sir-Daria, and Aral, and Caspian Seas. A few tribes of Kalmucks also live within these boundaries. Over this vast tract reigns a dismal monotony; the country has scarcely any important elevation or depression, no river of

consequence runs through it, no great forest breaks the uniformity of the scene; it is a vast steppe, the unformity of the scene; it is a vast steppe, containing \$50,000 English square miles, sterile, stony, and streamless, and covered with rank herbage of five feet high. It abounds in lakes and marshes, the water of which is generally brackish and unserviceable, and in the southern portion lies the Kara-Kum, an extensive salt desert .- The K. are a Turkish race, and speak the dialect of the Uzbeks, from whom they profess to be descended. They have, from time immemorial, been divided into the Great, Middle, and Little Hordes. The first of these wanders in the south-west portion of the ot these wanders in the south-west portion of the Russian steppe, partly in the Russian provinces north of the Ala-Tau, and partly in the territories of China and Khokan. They are subject to the rulers within whose bounds they dwell. The Middle Horde possesses the territory (called the country of the Siberian Kirghises) between the Ishim, Irtish, Lake Balkhash, Khokan, and the territory of the Little Horde; and also a great portion of the Russian province of Semipolatinsk. They are quite independent (though Russia arrogates sovereignty over their territory), with the exception of a small number in Semipolatinsk. The Little Horde (now more numerous than the other two together) ranges over the country bounded by the Ural, Tobol Siberian K., and Turkestan. Like the Middle Horde, they are claimed as subjects of the czar, though they are claimed as subjects of the exar, though completely independent. This horde is partly agricultural partly nomad. A small offshoot of the Little Horde has, since 1801, wandered between the Volga and the Ural river, and is under rule of the governor of Astrakhan. South of Lake Issikul, is a wild mountain tribe called the Dibo Kamennaja. the only tribe which calls itself Kirghis. They are called by their neighbours Kara-K. or Black K., and are of Mandshur stock. A portion of them are subject to Russia. Their collective numbers are estimated at upwards of 14 million of souls, more than half of whom belong to the Little Horde.

than had of whom belong to the Lather horozo-The K, are, with the exception above mentioned, nomadic, and are ruled by their own sultans or khans. They are restless and predatory, and have well carned for themselves the title of the 'Slave-huters of the Steppes', by scizing upon carwans, appropriating the goods, and selling their captives of the most elegant of the self-them they are at the great slave-markets of Khiva, Bokhara, &c. Their wealth consists of cattle, sheep, horses, and camels. Their religion is a corrupt Islamism. Notwithstanding the strenuous efforts of Russia to educate the K. within its territory, there are at the present time only twelve schools, attended by about 370 children.

KIRKCA'LDY, a royal and parliamentary burgh, seaport, and market-town of Scotland, in the county of Fife, stretches along the shore for about two miles-on which account it has been called the Lang Toun—and is about six miles north-east of Burntisland. Its harbour, which is dry at ebb-tide, is commodious, and admits ships of considerable Linen manufactures, coal, agricultural produce, sheep, and pigs, are the chief exports. The principal manufactures are sheetings, dowlas, tick, sail-cloth, and cottons. The town comprises several flax-mills, bleach-fields, cotton-factories, tanneries, iron-foundries, and breweries. In 1861, 2479 vessels, of 178,320 tons, entered and cleared the port. Pop. 10,851.

KIRKCU'DBRIGHTSHIRE, more properly the Stewartry of Kirkcudbright, a county in Scotland,

county of Wigton. Its length from east to west is from 45 to 50 miles, and its breadth is about 40 miles. Its area is 954 square miles, or 610,734 acres, of which there are 184.761 acres under rotation of of which are 184, 101 acres under rotation of crops and grass. The rest is composed of hilly and mossy ground, and lakes, of which there is one in almost every parish. Some of the hills, one-fourth of which are of granite, are of considerable altitude; among which are Cairusmore, 2597 feet; Criffel, 1831 feet; and Cairnharrow, 1110 feet. There are several considerable rivers, the principal of which are the Cree and the Dee; the latter of which is navigable for two miles above Kirkendbright.

There are upwards of 400 landowners, many of whom possess small bounds, and farm their own land. One-half of the land is under entail. The occupants number 1377. The old valued rent was £9549, and the new, last year, was £266,056. In 1857, the last year in which the statistics were taken, there were 2178 acres of wheat, averaging 25 bushels 13 pecks per acre; 1590 of barley, 29 bushels 24 pecks; 34,891 of oats, 32 bushels 1 peck; 15,414 acres of turnips, 14 tons 1½ cwt. per acre; and 2921 acres of potatoes, 3 tons 7½ cwt. per acre. Of live-stock there were 6019 horses, 39,099 cattle, 284,520 sheep, and 7203 swine; total stock, 336,841. The condition of the rural inhabitants, and the state The condition of the rural inhabitants, and the state of agriculture of this country, up to almost the end of last century, was very primitive; the principal food of the people, in the early part of the century, was kail, and oats ground in querns turned by the hand, and dried in a pot. The principal towns are Kirkeudbright, the county-town, with a population of 2838; New Golloway, Creetown, Gatehouse, Castle-Douglas, &c. Before the Reformation, the sewartry possessed more monasteries than any other county of Scotland. There have been a few regiment men of letters connected with this country. eminent men of letters connected with this county, of whom the most celebrated were Dr Alexander Murray, the linguist, and Dr Thomas Brown. The population in 1861 was 42,495. Inhabited houses, 7326. The constituency number 1344, who return one member to parliament.

KI'RKDALE CAVE, near Kirkdale Church, in the vale of Pickering, Yorkshire, is famous for the numerous remains of Tertiary mammals which have been found in it. It was discovered in 1821, in the cutting back of an colitic limestone rock in which it is situated. It was examined by Buckland, and It was examined by bickland, and fully described by him in his Reliquiæ Diluvianæ. Its greatest length is stated at 245 feet, and its height generally to be so inconsiderable, that there are only two or three places where a man can stand erect. The fossil bones are contained in a deposit of mud that lies on the floor of the cave : this is covered by stalagmite formed by the water, highly charged with carbonate of lime, dropping from the roof. The remains of the following animals have been discovered: hyæna, tiger, bear, wolf, weasel, elephant, rhinoceros, hippopotamus, horse, ox, deer, bare, rabbit, water-rat, raven, pigeon, lark, and duck.

KI'RKHAM, a market-town of England, in the county of Lancaster, is situated on a small tributary of the estuary of the Ribble, \$\frac{1}{2}\$ miles west-north-west of Preston. Sail-cloth, sacking, cordage, and cotton fabrics are manufactured. Pop. (1861) 3380.

KIRKINTI'LLOCH, a burgh of barony and market-town in Dumbartonshire, Scotland, is situated on the Forth and Clyde Canal, about six miles northnorth-east of Glasgow. It had its origin in a fort on Antoninus' Wall, and is said to have been called at first Caerpentulach (the fort at the end of the Sewarty of Afficiently a country in sectionary, at the state of the state of the castern district of Galloway, at first Caerpentulack (the fort at the end of the is bounded on the N. and N.E. by the counties of ridge), of which its present name is supposed to be Ayr and Dumfries, on the E. and S. by the Solway a corruption. It became a burgh of barony in the Firth and the Irish Sea, and on the W. by the time of William the Lion. Hats and cotton cloths are manufactured here, and there are bleaching and printing works, collieries, iron-stone mines, and quarries. Pop. (1861) 6096.

KIRK-ROAD, in the Law of Scotland, means a road used by the inhabitants of a district (generally a short cut) for the purpose of going to church. Such a right to a road, if ancient, is recognised as valid in Scotland, and also in England and Iroland.

KIRK-SESSION, in Scotland, &c., the lowest court in Presbyterian churches; being the governing body of a particular congregation, and composed of the 'minister' and 'elders' of the congregation. An appeal may be taken from the kirk-session to the presbytery, and thence to the higher courts of the church. Subject to this appeal, the kirk-session exercises discipline in regard to all members of the congregation, suspending from or restoring to the privileges of the church; and questions of this kind must originate in the kirk-session, and be primarily determined there. The functions of the kirk-session were, in former times, too often inquisitorially exercised; but this is now less frequently attempted, and the danger of it is continually diminishing through the growth of an enlightened public opinion. In former times, also, the kirk-session in Scotland often imposed fines, chiefly for offences against the seventh commandment; but this practice had no recognition in civil nor even in ecclesiastical law, and is now wholly relinquished. The kirk-session of the Established Church in each parish is fully recognised in Scottish law as having certain rights and duties with respect to the poor, but recent legislation has very much deprived it of its former

KI'RKWALL, a royal and municipal burgh, seaport, and market-town of Scotland, capital of the county of Orkney, is situated on the north-east coast of Mainland, about 26 miles north-north-east of John O'Groat's House. Its chief building is the cathedral of St Magnus, a fine cruciform structure, in mixed Norman and Gothie, dating from about the year 1138. In the choir of this cathedral, service is still held. Around it are the ruins of the King's Castle, the Earl's Palace, and the Bishop's Palace. The town has been greatly improved within recent years. Numerous shops have been established, so that the commercial transactions are now not confined to the annual fair in August, as they were of Orkney, sent chiefly through Kirkwall, amounted in value to £181,483. In 1861, 862 vessels, of 72,120 tons, entered and cleared the port. K. unites with the Wick burghs in sending a member to parliament. Pop. (1861) of parliamentary burgh, 3519.

KIRSANOFF, a town of Great Russia, in the government of Tambov, in lat. 52° 39° N., long. 44° 44° E. Horses and fine fleeced sheep are reared here, common feloth is manufactured, and there are two annual fairs. Pop. 5665.

KIRSCHWASSER (Ger. cherry-water) is a liquour made from cherries, and highly esteemed in Germany. The cherries, gathered when quite rips, and treed from their stalks, are pounded in a wooden vessel, but so that the stones are not broken. They are then left to ferment, and when fermentation has begun, the mass is stirred two or three times a day. The stones are afterwards broken, and the kernels broken and thrown in. By distrisant times are the standard of the sum of the sametimes called Cherry Brandy, but the common cherry brandy is made by mixing brandy with the gines of cherries.

KISFALUDY, SANDOR (ALEXANDER), a Hungarian poet, who exercised a great influence on the development of the language and literature of his native country, was born at Samegh (county of Szalad), 22d September 1772. He studied at Raab and Presburg, and after serving for several years in the Austrian army, retired to his paternal estate, to devote himself to literature and farming. The first part of his lyrical master-piece, Himfy' Szerelmei (Himfy's Love), which appeared anonymously in 1800, was received with unbounded applause. was spoken of as the 'Great Unknown.' On the publication of the second part in 1807, the author threw aside his mask. In the same year, he published his Reyek & Magyar Elöidlöböl (Legends of the Olden Time in Hungary), which are marked by depth of feeling, and by elegance and simplicity of style. K. now attempted tragedy, and took Schiller as his model. Some of his historical dramas are worthy of mention, for example, his Janos Hunyadi, and Latislaus the Cumanian. Some of his pieces, illustrating the family life of his countrymen, are among the best on the Hungarian stage. plete edition of his writings appeared at Pesth, in 8 vols., 1833—1838. He died at Sümegh, 30th

KISFALUDY, KAROLY (CHARLES), younger brother of the preceding, was born 19th March 1798. He is of preceding, imports on 19th March 1798. He is of preceding imports of the property of the pro

KISHM (the ancient *Oaructa*), an island of Persia, belonging to the Imaum of Muscat, is stuated at the mouth of the Persian Gall, and is about 70 miles in length by 12 in average breadth. It is separated from the mainland by a deep and dangerous strait, in which are several small wooked islets. K. yields in abundance grain, timber, dates, and vegetables, and supports numerous cattle. At its castern extremity is a town of the same name, the capital of the island. Entire pop. estimated at 5000.

KISS, Arders, a distinguished German soulptor, was born at Pleas, in Upper Silesia, 11th October 1892. He studied under Rauch at Berlin, and greatually acquired a high reputation, which was greatly increased on the completion, in 1839, of the model of his celebrated olossal group of the 'Amazon attacked by a Panther,' for the execution of which in bronze, now the ornament of the Museum Stairs in Berlin, the sum of 40,000 thalers was subscribed with the greatest enthusiasm on the part of the public. A bronzed zine model of this group was regarded with the lightest atlantation at the Great Exhibition in London (1851). His '84 place at the Paris Exhibition (1855), was must less favourably criticised. Among his other important works are a '85 Michael overthrowing the Dragon,' 'A Tiger destroying a Serpent,' and a statue of Frederick the Great. He died in 1862.

KISSINGEN, a town of Bavaria, in Lower Franconia, eelebrated for its mineral waters, is situated in the valley of the Saale, 30 miles north-north-east of Würzburg. Of its three mineral springs, the Rakoczy and the Pandur furnish saine and chalybeate waters, the Maxbrunnen are acidulous and alkaline. A spring called the Soolen-Sprudul is remarkable for the periodical ebb and flow of its waters, caused apparently by the accumulation and discharge of carbonic acid gas. The waters are both drunk and used as baths by the patients, and are considered specially efficacious in cases of chronic disease, gout. &c. From 410,000 to 500,000 bottles are exported from K. annually. Since 1848, gaming-tables have been forbidden here by the Bavarian government. Pop. 1926.

KI'STNAH, or KRI'SHNA, a river of the peninsula of Hindustan, rises within 40 miles of the Arabian Sea, at a height of 4500 feet, in lat. 18° 1' N., and flowing eastward, falls into the Bay of Bengal, after a course of 800 miles. It forms a considerable delta at its mouth. Within the lower or level basin of the stream, artificial means have extended irrigation at an expense of £150,000, the principal work being an agnicut or embankment across the stream at the head of the delta. The principal tributaries are the Bimah, the Tungabhadro, and

the Musi.

KIT, in military language, the equipment in necessaries, such as shirts, boots, brushes, &c., of a soldier, but not applicable to his uniform, arms, or accourtements. Formerly, a high bounty was given, and then severely encroached upon, by making the recruit pay for his kit. As this system led soldiers often to allege that they had been enlisted on a false understanding, the system was changed in 1855, and the fairer principle adopted of issuing a free kit to each recruit, with a smaller bounty. The soldier has still to replace necessaries, worn out or lost, at his own expense, but he obtains the articles at wholesale, and very low, prices. As these necessaries are so cheaply procured, it is held a very heavy military offence to make away with them, and is ordinarily punished with great severity.

KIT, a small narrow-bodied violin, about 16 inches long, capable of being carried in the coatpocket, and used chiefly by teachers of dancing.

KITCHEN-GARDEN, a garden devoted to the cultivation of culinary vegetables, or that part of a large garden which is specially appropriated to this use. As the crops of the kitchen-garden are not generally very pleasing to the eye, care is taken, if possible, that it may not be within view of the principal windows of a mansion-house, or otherwise obtruded on notice. But regard must also be had, in the selection of a situation for the kitchen-garden, to exposure, shelter, &c., in which it needs and deserves every advantage that can be obtained. Nor, in order to hide it from view, ought it to be so surrounded with trees as to deprive it either of sunshine or of free access of air.

The general remarks made in the article GARDEN-TRG as to soil and the preparation of it, manuring, water, gardening operations, &c., are all applicable to the kitchen-garden; a part of which, or a place close beside it, is always allotted to compost heaps and the processes connected with them. The successful cultivation of a kitchen-garden requires constant care and labour. Many crops require frequent digging and hoeing during the period of their growth, and the ground must be kept free of weeds as perfectly as in the flower-garden itself. A rotation of crops is of as much importance in the kitchengarden as in the farm; cabbages and their congeners, rhubarb, and attention must be paid to this in laving out the garden.

The crops cultivated depend, of course, on climate. It will be enough to enumerate here the most important kitchen-garden crops of Britain, referring for further information to each as a separate head The capitals indicate those most generally cultivated. The varieties of Brassica oleracea; KALE. CAEBAGE, COLEWORTS, SAVOYS, BRUSSELS SPROUTS, CAULIFLOWER, BROCCOLI, Kohl-rabi, &c. POTATO, JERUSALEM ARTICHOKE, TURNIP, CARROT, PARSNIP, RADISH, RED BEET, Skirret, SALSAFY, SCOTZODETA, BEAN, PEA, KIDNEY-BEAN, SCARLET-RUNNER, ONION, LEEK, Garlic, SHALLOT, Rocambole, Welsh ONION, LEEK, GATHG, SHALLOT, ROCKHOONE, WASHING ONION, SPINACH, White Beet, ASPARAGUS, SEA-KALE, ARTICHORE, LETTUCE, CRESS, MUSTARD, Sorrel, Corn-salad, Endive, CELERY, PARSLEY, HORSE-RADISH, RHUBARB.

Sweet herbs are to be found in almost all gardens, as Thyme, Lavender, Sage, Spearmint, Balm, Marjoram, Savory, &c. The cultivation of the pumpkin, vegetable marrow, and all kinds of gourds, and of the melon and cucumber, is regarded as belonging to the kitchen-garden; which also contains the houses or pits employed for forcing both vegetables and fruits. And the hothouses in which fruits are grown for culinary use, are very generally placed in the kitchen-garden. The cultivation of mushrooms, whether in beds or otherwise, belongs to the kitchen-garden.

KITE (Milrus), a genus of Falconidae, or a subfamily including Elanets, &c., of which only one species is a common native of Britain, and another is amongst its rarest visitants. The kites have much weaker bill and talons than the falcons and

Kite (Milvus vulgaris).

hawks, but the wings are much longer, and the tail is rather long and forked. Their legs are short. They are remarkable for their gracefulness of flight, and power of sailing and wheeling about, or gliding in the air. A Scotch and local English name of the COMMON KITE (M. vulgaris), GLEAD or GLED, is believed to be from the same root with glide.

The common K. is found in almost all parts of Europe, the north and centre of Asia, and the north of Africa. It is fully two feet in length, from the tip of the bill to the tip of the tail, the plumage produces, leguminous crops, &c., must not from year mostly brown, of various shades, in some parts to year be grown on the same ground. But there mixed with gray. It feels on reptiles, mice, moles, are some perennial plants which occupy the same and other small quadrupeds, and the young of ground for years, as artichoke, asparagus, and gallinaceous birds, searching for its prey on the

ground, and often from no small elevation in the nir. It sometimes catches fish. It was formerly more abundant than at present, and was the seourge of the poultry-vards. It was also the scavenger of London and other English towns, devouring the offal, as it still does in some of the towns of Eastern Europe, and performing its office fearlessly even in the midst of the people. This continued to be the case in London to the time of Henry VIII. The K,'s nest is usually in the fork of a tree in a thick wood. It is easily tamed, -A very rare British bird is the SWALLOW-TAILED K. (Nanclerus furcatus), a smaller bird than the common K., abundant in many parts of North America. - Elanus teneurus is another American species from the Southern States, of elegant form and colour. - The Go-VINDA K. (M. Govinda) is common in India. Other species are found in different parts of the world.

KITTIWAKE (Larus tridactulus, or L. rissa), a species of GULL (q. v.), interesting on account of its abundance in very northern regions, and its importance to their inhabitants. In addition to what is stated in the article GULL, it may be mentioned that the young of the K, has dark markings in its plumage which disappear in the adult, is known on

Kittiwake (Larus tridactulus).

some parts of the British coasts as the TARROCK. and was for some time regarded by naturalists as a distinct species; also that the flesh of the K. is much more pleasant than that of most gulls, and its eggs very good; that it lays usually three eggs, which are fully two inches in length. It is found plentifully in all the northern parts of the world, wherever the coast is high and rocky, migrating southwards in winter, and extending its range as is found on the Caspian Sea

KITTO, DR John, a most industrious and respectable writer on biblical subjects, was born at Plymouth, December 4, 1804. In his 12th year, he lost his power of hearing, in consequence of a fall from a height of 35 feet. His father's circumstances were at this time so wretched, that young K. was soon after sent to the workhouse. Here he learned the trade of shoemaking, and was also enabled to include that taste for reading which had marked him from his earliest years. In 1824, he went to Exeter to learn dentistry with a Mr Grove, who had known him in Plymouth, and who took a warm interest in the unfortunate youth. Mr Grove encouraged K. in his literary aspirations, and in 1825 he published Essays and Letters by John Kitto. In the same year, he was sent, by the kind-

Islington, to be trained for some useful employment abroad. In May 1829, he accompanied Mr Grove and family on a tour to the East, visiting in the course of his travels St Petersburg, Astrakhan, the Kalmuck Tartars, the Cancasus, Armenia, Persia, and Bagdad. He returned to England in 1833. The rest of his life was spent in the service of the booksellers, chiefly in that of Mr Charles Knight, by whom he was liberally treated. He died at Cannstalt, in Würtemberg, whither he had gone for the benefit of his health, November 25, 1854. His principal works are—The Pictorial Bible (1838; new edition by W. and R. Chambers. 1855), Peterial History of Palestine (1839—1840), History of Palestine (1843), Thoughts among Flowers (1843), The Lost Senses—Deafness and Blindness (1845). and Journal of Sacred Literature (1848-1853). He also edited the Cyclopedia of Biblical Literature (published by A. and C. Black). K.'s biography has been written by Dr J. E. Ryland (1856); a later and better biography is that by Professor Endie of Glasgow. In 1844, the university of Giessen conferred on him the title of D.D.

KIUNG-CHAU', chief city of the island of Hainan (q. v.).

KI'ZIL-KUM (Red Sand), a sandy desert in the north of Turkestan, lying between the Amu-Daria and Sir-Daria, and stretching from the Sea of Aral to Khokan, in lat. 41°—46° 30′ N., and long. 60°— 69′ E. A continuation of this desert northwards across the Sir-Daria is called Kara-Kum (Black Sand) and forms portion of the Kirghis Steppe.

KIZLIA'R, a town in the south of Russia, in the government of Stavropol, is situated about 40 miles from the mouth of the river Terek, in lat. 43° 53' N., long. 46° 43' E. It contains a fortress, many vinevards, tanneries, and silk-worm nurseries, and carries on an extensive trade in wine, brandy, and fish. A model vineyard and a school for instruction in winemaking have been established here. The climate is unhealthy. Pop. 8245.

KLA'GENFURT, a town of Austria, capital of the crownland of Carinthia, is situated on the river Glau, two miles east of the Worthsee, with which it is connected by means of a canal, and about 80 miles north-north-east of Trieste. It is the seat of the Prince-bishop of Gurk, and has a library of 50,000 vols. K. has a white-lead factory-the largest in Austria-and manufactures woollen, silk, and cotton fabries. An active transit trade is here carried on. Pop. 15,000. Here the Hungarian general Görgei has been confined since his surrender to the Russians at Világos in 1849.

KLAPKA, GYORGY (GEORGE), one of the most heroic and skilful generals of the Hungarian war, is the son of the burgomaster of Temesvar, and was born 7th April 1820. In 1838, he entered the Austrian army, and had attained the rank of lieutenant-colonel when the revolution of 1848 burst out. K. instantly placed himself at the service of the Hungarian government, and task a prominent part throughout the struggle. The plan of the Hungarian campaign in the opening of 1849, which was carried out with such great success, was K.'s work. In several of the battles, the fortune of the day was decided by the troops under his command. But the crowning glory of his patriotic career was his defence of tomorn (q. v.), at the close of the revolution. His famous sally on the 5th of August was perhaps the most splendid deed of arms in the whole war. The Austrian army besieging the fortress was interly routed, losing 30 pieces of artillery, 3000 muskets, vast quantities of ness of various friends, to the Missionary College at provisions, and about 2000 head of cattle. K. was prepared to carry the war into Austria or Styria, but the news of the surrender of Gorgei, and the flight of Kossuth, paralysed his action. He held out, however, until the 27th September, when he capitulated to General Haynau, on condition that the garrison should retain their lives and liberties. K, then proceeded to England, but afterwards to Genoa. In 1859, he was requested by the Sardinian government to form a Hungarian Legion to be used in the war against Austria, but the peace of Villafranca destroyed his hopes of active service. K. has written, among other works, The National War in Hungary and Transylvania (2 vols. Leip. 1851), and The War in the East, &c. (Lond, 1855). In 1867 he returned to Hungary, was elected a member of the Diet, and joined the party of Denk

KLAPROTH, HEINRICH JULIUS VON, one of the greatest oriental linguists that ever lived, was the son of Martin Heinrich Klaproth, an eminent chemist, and was horn at Berlin, October 11, 1783. hetook himself to the study (secretly) of the Chinese language, when only a boy of fourteen, having previously found out that there was a small collection of Chinese books in the public library of Berlin. In 1801, he entered the university of Halle, where he continued for several years. Here he published his Asiatischer Magazin, which gave him a high reputation. Having gone to Russia in 1805, in company with his friend, Count Potocki, he was appointed interpreter to the Russian embassy to China. The embassy proceeding nearly 200 miles into Mongolia, was ordered by the Chinese emperor to return, as 'he did not want to see them;' but K. took the opportunity of exploring Siberia. He was soon after despatched on a scientific mission to the Caucasus: the results of his valuable explorations are conthe results of his vanuage exportations are contained in his Reise in den Kaukensus sund Georgien in den J. 1807 und 1808 (2 vols. Halle, 1812—1814; Freuch, with numerous additions, Paris, 1823). While in Russia, he received many honours. In 1812, he left the Russian service, and returned to Germany; but finally settled at Paris in 1815, where he died, 20th August 1835. K.'s literary activity, especially after 1815, was something prodigious; yet, strange to say, it was accompanied by an excessive love of pleasure, for the gratification of which Paris afforded him only too many facilities. His writings relate to the languages and latenties. Ins writings relate to the languages and history of the East, more particularly of China, and to the geography of the Russian empire; they are marked by immense learning and extraordinary acuteness, but unfortunately they also contain the most virulent attacks on other scholars. Among his works, we may mention Geographisch-historische Beschreibung des Oestlichen Kaukasus (Weim. 1814); Beschreibung der Russ. Provinzen zwischen dem Kaspisce und Schwarzen Meere (Berl. 1814); Verzeichniss der Chines. und Mandschuischen Bücher und Manuscripte der Königl. Bibliothek in Berlin (Paris, 1822); Asia Polyglotta (with tables, 1823; 2d edit. Paris, 1829, with a life of Buddha according to the Mongolian legends), a work in which the various Asiatic nations are classified according to the affinities of their languages, and the beginning of their authentic history determined; Tableaux historiques de l'Asie depuis la Monarchie de Cyrus juspu'à nos jours (4 vols. Paris, 1824—1826, with 24 maps); Mémoires relatifs à l'Asie (Paris, 1834); Collections d'Antiquités Egyptiennes (Paris, 1829); Examen Critique des Travaux de M. Champollion jeune sur les Hicroglyphes (Paris, 1832); Notice d'une Mappe-monde et d'une Cosmographie Chinoises publiées en Chine, l'une en 1730, l'autre en 1793 (Paris, 1833).

KLA'TTAU, a town of Bohemia, in a fertile

a castle and gymnasium, and carries on manufactures of woollen cloth and leather. Pop. 6300.

KLAU'SENBURG, a town of Austria, capital of the crownland of Transylvania, is situated on the Little Szamos, 80 miles east-south-east of Grosswardein. It is surrounded by old walls, and is divided into the old and the new town. Among its public buildings are a lyceum, a gymnasium, several hospitals and other institutions, henevolent and educational. Woollens, earthenware, and paper are manufactured. The trade of K. is not important. Pop. 20,615.

KLAU'STHAL, a celebrated mining-town of Hanover, on a bleak plateau of the Upper Harz, 25 miles north-east of Göttingen. Situated 1792 feet above sea-level, so that the potato is the chief crop that can be cultivated with success, the inhabitants find their principal employment in the mines and foundries. The ores raised are silver, lead, zinc. copper, and iron. 2000 workmen are employed in the mines, and 1000 in the foundries. In the mint, 14,000 thalers (equal to £2027) are coined weekly. Although the arrangements and appointments of the mines are very complete, yet their produce has greatly declined, and scarely repays the manage-ment of government, into whose hands they have almost all fallen. Pop. with subarbs 14,000.

KLEBER, JEAN BAPTISTE, a distinguished general of the French Republic, born 6th March 1753, at Strasburg, where his father was a garden-labourer. Having received a good education, he entered the Austrian army, but returned to France, and embracing the cause of the Revolution, rapidly rose to high military rank. He accompanied Bonaparte to Egypt as a general of division, was dangerously to Egypt as a general of division, was cangerously wounded at the capture of Alexandria, but recovered so as to take part in the expedition to Syria, and won the battle of Mount Tabor. When Bonaparte left Egypt, he intrusted the chief command there to K., who concluded a convention with Commodore Sidney Smith for its evacuation; but on Admiral Keith's refusal to ratify this convention, K. adopted the bold resolution of reconquering it, and destroyed the Turkish army at Heliopolis. During an attempt to conclude a treaty with the Turks, K. was assassinated by a Turkish fanatic at Cairo, 14th June 1800.

KLENZE, LEO CHEVALIER VON, a distinguished German architect, was born in 1784, in the principality of Hıldesheim, and having studied archicipanty of Interestent, and having Scatter acceptance to the Berlin and Paris, was appointed architect to King Jerome of Westphaha in 1808; held a similar position at the court of Bavaria from 1815 to 1839, and in 1833 was raised to the rank of hereditary nobility in that kingdom. In 1834, he was sent to Atlens, to superintend the reconstruction of that capital, and in 1839 went to St Petersburg, to execute some works for the Emperor of Russia. Many of the finest buildings recently erected on the continent of Europe are monuments of K.'s genius, such as the Glyptothek, the Pina-kothek, the Walhalla, and many other structures in Munich, the Imperial Museum at St Peters-burg, and several buildings in Athens. He was the author of several works, chiefly on the subject of architecture. He died in 1864.

KLEPTOMA'NIA (Gr. klept, to steal). Among the ordinary phenomena of minds that are not regarded as insane or criminal are observed inordinate tendencies to acquire, to collect, to hoard. So long as such an impulse does not interfere with the rights and property of others, or involve a flagrant breach of law, it is readily admitted as ar indication of disease, or as an absurdity and eccentricity which district, 68 miles south-west of Prague. It contains may fairly consign the individual to an asylum or

to contempt, but concerns no one else. But whenever the amount of the object appropriated, or the circumstances under which it is purloined, bring the matter into a court of law, the act is treated as a theft, and punished. In many cases, however, such conduct is the obvious result of disease. The inclination to steal is a premonitory indication of many forms of mental disorder: it is a characteristic symptom of many others, where violence, or delusions, or incoherence, leave no doubt as to the source from which it springs. But there are other cases in which the morbid origin cannot be so clearly demonstrated-where the mind is clear and cogent, the morals pure, and where theft is the only proof of insanity. There is evidence, however, in favour missing. here is evidence, however, in favour of the opinion, that the propensity to acquire may become so irresistible, and the will so impotent, that the appropriation is involuntary, and the perpetrator irresponsible. The gratification of the impulse is found associated with physical changes and conditions which may be regarded as incompatible with the healthy discharge of the functions of the nervous system; but the connection is not invariable, and the best mode of establishing the reality of such a disease is to consider marked cases in relation to the character, interests, and previous deportment of the individual-to the nature of the articles taken and to the motives which seem to have determined the action. A baronet of large fortune stole, while on the continent, pieces of old iron and of broken crockery, and in such quantities, that tons of these collections were presented to the custom-house officers. A clergyman of respectable bearing and great usefulness abstracted from bookshops and stalls hundreds of copies of the Bible, perhaps with the intention of distribution, physician pocketed some small object whenever he entered the apartment of a patient; another member of this profession stole nothing but table-cloths. The incongruities in such narratives point to the existence of deep-scated unhealth. Although each case must be tested on its own merits, there are various features, common to a number of even doubtful cases, which should be embraced wherever a judgment is formed. The objects are often stolen ostentationally, or without any adequate precautions to conceal the attempt; they are of no value in themselves, or useless to the thief; the act is solitary, independent, without motive, and promptly and spontaneously avowed, and, if overlooked, repeated. The article acquired is restored, or altogether disregarded; and although money is rarely taken, bright and coloured objects most generally excite cupidity. It is observed in extreme youth; it is associated with pregnancy; it is here-ditary; and often follows affections of the brain, and those critical and crucial changes in disposition and those critical and critical changes in disposition which are only explicable on the supposition of corresponding alterations in the organisation.—A Manual of Psychological Medicine, by Drs Buckrell and Tuke, pp. 224 et seq.; Ann. Med. Psychol., t. v. p. 666 (1853).

KLIA'ZMA, a river of Russia, an affluent of the Oka, rises in the government of Moscow, and flows east through those of Vladimir and Nijni-Novgorod, joining the main stream near the town of Gorbatof, after a course of 327 miles, for the last 150 of which it is navigable. Passing through the most industrial governments of Russia, it is one of the principal commercial arteries of the empire.

KLI'NKET, a term in Fortification, signifying a small postern or gate in a palisade.

KLOPSTOCK, FRIEDRICH GOTTLIEB, a German poet, was born 2d July, 1724, at Quedlinburg, and went to Jena in 1745, to study theology. He had

already formed the resolution to write a great epic poem, and thought of Henry the Fowler as a good subject for one; and at Jena he composed the first cantos of his Messiah. In 1746, he passed to Leipsic, and there became acquainted with the editors of the Bremische Beiträge, in which the first three cantos of the Messiah appeared in 1748. They attracted great attention: the author was pronounced a religious poet of the highest order. He was now invited to Copenhagen, upon the recomto the king, whom he accompanied on his travels. In 1771, K. settled in Hamburg, with a sinecure appointment and a pension from the Danish government, and subsequently received an honorary title and a pension from the Markgraf, afterwards Grand Duke, of Baden. In 1773, the last five cantos of his Messiah were published at Halle. He died 14th March 1803. K.'s name has (or rather perhaps had) a very high place in German literature. ever may be thought of the intrinsic value of his poetry, it cannot be denied that he exercised a very important and beneficial influence on the national taste. The greatest of his successors, Goethe, acknowledged this, though he also expressed the opinion, that K, had become rather obsolete, or at least that his conception of poetry had become so. When K. first began to write, the literature

and social life of Germany were penetrated by French influences. A cold, correct, unimaginative spirit tyrannised over the thought and habits of the people. K. broke loose at once from this shallow despotism, and breathed the air of Freedom into German poetry. Odes, tragedies in which he introduces Hermann (q. v.) the Cheruscian as a national hero-and biblical dramas, with some hymns, which still find a place in collections, con-stitute the remainder of K.'s poetry. His works were collected and published in 12 vols. (Leip. 1799-1817), in 18 vols. (1823-1829), in 9 vols. (1839). The Messiah has been translated both into verse and prose in English.

KNAPP, Albert, a German poet, author of many of the best modern German hymns, is a native of Würtemberg, and was born in 1798. He studied for the church, and is now the principal clergy man in Stuttgart. K. has breathed a new life into that long-neglected branch of poetry the religious hymn. Many of his effusions are to be found in the Christoterpe, a periodical edited by him since 1833. His Christliche Gedichte, in 2 vols. (Stuttg. 1829; 3d edit., Basel, 1843), to which a third was added nader the title of Neuere Gedichte (Stuttg. 1834), were published by his friends. His later hymns are contained in his Gedichte (Stuttg. 1843). K. is equally distinguished as a hymnologist. His Evang. Liederschatz für Kirche und Haus (2 vols. Stuttg. und Tüb. 1837; 2d edit. 1850) is one of the most valuable collections of Christian hymns of all a splendid supplement. His Hohenstaufen (Stuttg. 1839) is a cycle of religions songs and poems.

KNA'PSACK, a bag of canvas or skin, containing a soldier's necessaries, and worn suspended by straps between his shoulders. Those used in the British army are ordinarily of black painted canvas, but some other nations, as the Swiss, make them of thick goat-skin, dressed with the hair on. The knapsack affords by far the easiest way of carrying light personal luggage during a march or walking-

KNAPWEED. See CENTAUREA.

KNA RESBOROUGH, a parliamentary borough and market-town of England, in the West Riding of Yorkshire, on the left bank of the Nidd, 18 miles

vicinity, is well known for the murder committed there by Eugene Aram in 1745. Manufactures of linen and cotton goods are carried on here. K. has returned two members to the House of Commons since 1553. Pop. of parliamentary borough, 5404.

KNAVESHIP, in the Law of Scotland, is a proportion of the grain given to the miller's servant who performs the work of the mill, such mill being an ancient mill to which a right of thirlage is attached. See THIRLAGE, INSUCKEN MULTURES.

KNEE, in Ship-building, an angular piece of wood or iron used to connect the deck-beams with the ribs of the vessel's sides. The knees are fastened on both vertically, above and below, and horizontally, whereby great stability is imparted to the whole framework of the ship.

KNEE-JOINT, THE, is the articulation between the femre or thigh-bone, above, and the tibia or shin-bone, below. A third hone, the patella, or knee-cap—one of the Sesamoid Bones (q. v.), and not a true bone of the skeleton—also enters into the structure of this joint anteriorly. The articular surfaces of these bones are covered with cartilage, lined by a synovial membrane or sac, which is the largest and most extensive in the body, and con-nected together by ligaments, some of which lie external to the joint, while others occupy its interior.

The most important of the external ligaments are the anterior or Ligamentum Patellee, which is in reality that portion of the Quadriceps Extensor Cruris which is continued from the knee-cap to the tubercle of the tibia (see figure); one internal, and two external lateral ligaments; a posterior

Internal view of the Right Knee-joint.

(From Gray's Human Anatomy.) a, the femny; b and c, the internal and the external condyles d and c, the two crucial ligaments; f and g, the external and internal semilunar cartilages; k and i, the upper part of the fibula; j, the upper part of the tibia.

ligament; and a capsular ligament, which surrounds the joint in the intervals left by the preceding ligaments. The positions of these ligaments are sufficiently indicated by their names. Of the internal bigaments, the two crucial, so called because they cross one another, are the most important. Their position is shewn in the figure. The external and internal semilunar cartilages are usually placed amongst the internal ligaments; they are two crescentric plates of cartilage. The outer part of each National Antiquities (2 vols. 1845); Holf-hours cartilage is thick; the inner free border thin. Each with the Best Authors (4 vols. 1847—1848); The

west-north-west of York. St. Robert's Cave, in the cartilage covers nearly the outer two-thirds of the corresponding articular surface of the tibia, and by its form deepens these surfaces for firmer articulation with the condyles of the femur.

tion with the condytes of the tenur.

The chief movements of this joint are those of a hinge-joint—namely, flexion and extension, but it is also capable of slight rotatory motion when the knee is half-flexed. During flexion, the articular surfaces of the this glide backwards upon the condyles of the femur; while in extension, they glide forwards. The whole range of motion of this joirt, the state of the condition of the conditi from extreme flexion to extreme extension, is about 150°. Judging from its articular surfaces, which have comparatively little adaptation for each other, it might be inferred that this was a weak and inscense joint; and yet it is very rarely dislocated. Its real strength depends on the large size of the articular ends of the bones, on the number and strength of the ligaments, and on the powerful muscles and fascize by which it is invested.

KNELLER, SIR GODFREY, an eminent portraitpainter, was born at Lübeck in 1648, and studied painting under Rembrandt and Ferdinand Bol. He at first chose historical subjects, but afterwards gave himself entirely to portrait-painting. In 1674, he went to London, and, on the death of Sir Peter Lely in 1680, was appointed court-painter to Charles II. In 1684, he visited Paris, at the invitation of Louis XIV., and painted portraits of the king and royal family. He retained his office at the English court during the reign of James II., and continued to fill it after the Revolution. In 1692, William III. bestowed on him the honour of knighthood, which he afterwards received also from the Emperor Joseph I, ; and in 1715, George I. made him a baronet. He died in 1725, or, according to others, in 1726, and a monument was erected to him in Westminster Abbey, with a highly laudatory inscription by Pope. K.'s best-known productions are the 'Beauties of Hampton Court' (painted by order of William III.), and his portraits of the 'Kit-Cat Club.' He painted avowedly for the love of money, and hence never did justice to the talent he possessed, so that it is difficult for posterity to understand his reputation.

KNIGHT, CHARLES, an eminent English publisher and author, was born in 1791, at Windsor, where his father carried on the business of a bookseller. K. was brought up to the same profession, but early turned his attention to publishing. Among his first attempts in this department was The Etoniun, a periodical supported by the Eton boys, and which—in spite of its juvenility—obtained a considerable reputation. He next started (1823) Knight's Quarterly Magazine, and continued it for some time in London, to which he removed in the following year. The whole of his long and honourable career has been devoted to the cause of popular literature, of which he was one of the earliest and most accomplished advocates. Among the works which he has published or edited are the *Penny Magazine* (1832—1845), which was started only a month or two after Chambers's Edinburgh Journal, and at one time enjoyed a circulation of nearly and at one time enjoyed a citicusum of a neury 200,000 copies weekly; the British Almanac, and Companion to the Almanac; Penny Cyclopedia (30 vols. 1833—1856); Library of Entertaining Know-ledge—the volume on the Elephant (1831) being written by himself; Pictorial History of England written by immseit; I scorrae History O' Enganda (now the property of the Messrs Chambers, who published an 'improved edition' in 1855; Pictorial Bible (1838); Pictorial Book of Common Prayer (1838); Condon Pictorially Illustrated (6 vols. 1841—1844); Ohl England, a Pictorial Muesum of

Land we Live in (4 vols, 1848); Cyclopædia of the Industry of all Nations (1851); and The English Cyclopædia (24 vols. 1854-1861), which is based on the Penny Magazine, but is a great advance even on that admirable work, and, in fact, forms one of the most complete and accurate cyclopedias in the world. K. has, in addition, won a highly respectable position as an author by his Pictorial Shakspere, which is accompanied by a 'Biography' and a 'History of Opinion, with Doubtful Plays,' &c. (8 vols. 1839-1841); library edition (12 vols. &c. (8 Vols. 1537-1541); Intrary edition [12 vols. 1842-1844]; national edition, with 'Biography' and 'Studies' (8 vols. 1851-1853), Life of Carlon (1844); Plays and Poems, with Glossarial Notes (7th ed. 1857); Knowledge is Power (1855); and above all, by his Popular History of England, an Illustrated History of Society and Government from the Earliest Period to our own Times (1856-1862). This work is probably the very best history of England that we possess - the history, according to the Times, 'for English youth.'

KNIGHTS (Saxon, Cniht, a servant or attendant), originally men-at-arms bound to the performance of certain duties, among others to attend their sovereign or feudal superior on horseback in time of war. The institution of knighthood, as conferred by investiture, and with certain oaths and ceremonies, arose gradually throughout Europe as an adjunct of the feudal system (see Feudal System; Chivalry. The character of the knight was at once military and religious. The defence and recovery of the Holy Sepulchre, and the protection of pilgrims, were the objects to which, in the early times of the institution, he especially devoted himself. The system of knight-service, introduced into England by William the Conqueror, empowered the king, or even a superior lord who was a subject, to compel every holder of a certain extent of land, called a knight's fee, to become a mem-ber of the knightly order; his investiture being accounted proof that he possessed the requisite knightly arms, and was sufficiently trained in their use. The 'Statute of Knights,' of the first year of Edward II., regulating the causes that were to be held valid to excuse a man from knightly service, shews that in the 14th c. the knightly office was not always eagerly coveted; yet its social dignity was very considerable, for even dukes, if not admitted into the order, were obliged to yield precedence in any royal pageaut or public ceremony. In time of war, each knight was bound to attend the king for forty days, computed from the day when the enemy arrived in the country. After the long war between France and England, it became the practice for the sovereign to receive money compensations from subjects who were unwilling to receive knighthood, a system out of which grew a series of grievances, leading eventually to the total abolition of knight-service in the reign of Charles II.

Knighthood, originally a military distinction, came, in the 16th c., to be occasionally conferred on civilians, as a reward for valuable services rendered to the crown or community. The first civil knight in England was Sir William Walworth, lord mayor of London, who won that distinction by slaying the robel Wat Tyler in presence of the king. Since the abolition of kinght-service, kinghthood has been conferred without any regard to property, as a mark of the sovereign's esteem, or a reward for services of any kind, civil or military. In recent times, it has been bestowed at least as often on scholars, lawyers, artists, or citizens, as on soldiers, and in many cases for no weightier service than carrying a congratulatory address to court.

fasting and bathing were in early times necessary preparatives. In the 11th c., the creation of a knight was preceded by selemn confession, and a midnight vigil in the church, and followed by the his sword on the altar, to signify his devotion to the church, and determination to lead a holy life. The sword was redeemed in a sum of moncy, had a benediction pronounced over it, and was girded on by the highest ecclesiastic present. The title was conferred by binding the sword and spurs on the candidate, after which a blow was dealt him on the check or shoulder, as the last affront which he was to receive unrequited. He then took an oath to protect the distressed, maintain right against might, and never by word or deed to stain his character as a knight or a Christian. A knight might be degraded for the infringement of any part of his oath (an event of very rare occurrence), in which case his spurs were chopped off with a hatchet, his sword broken, his escutcheon reversed, and some religious observances were added, during which each piece of armour was taken off in succession. and east from the recreant knight.

It has been said that knighthood could originally be conferred by any person of knightly condition, but if so, the right to bestow it was early restricted to persons of rank, and afterwards to the sovereign or his representative, as the commander of an army. In England, the sovereign new bestows knightheod by a verbal declaration, accompanied with a simple by a vertical declaration, accompanied with a simple ceremony of imposition of the sword, and without any patent or written instrument. In some few instances, knighthood has been conferred by patent, when the persons knighted could not conveniently come into the presence of revalty, as in the case of governors of colonies, or other persons occupying prominent situations abroad. The lord-lieutenant of Ireland also occasionally but rarely exercises a delegated power of conferring knighthood. The monosyllable 'Sir' is prefixed to the Christian names of knights and baronets, and their wives have the legal designation of 'Dame,' which in common intercourse becomes 'Lady.'

Persons who are simply knights without belonging to any order, are called in England Knights Bachelors, a name probably corrupted from bas cheralier. Knighthood of this kind is now only conferred in Great Britain. A degree of knighthood called Banneret formerly existed in England and France, which was given on the field of battle in reward for the performance of some heroic act. For the mode in which that dignity was conferred, see BANNERET. No knight-banneret has been created in the field since the time of Charles I., when that honour was bestowed on one Sir John Smith, for rescuing the roval standard from the bands of the rebels. George III. twice conferred the title on occasion of a review,

but the proceeding was considered irregular, and the rank of the knights not generally recognised. The form of helinet which the requirements of the later heraldry have appropriated to knights, entitling them to place it over their arms, is fullfaced, of steel, decorated with bars, and with the visor a little open. It is represented under the article HELMET.

KNIGHT'S FEE. See KNIGHTS.

KNIGHTS OF THE SHIRE, otherwise called in England Knights of Parliament. They were knights formerly chosen by the freeholders of every county to represent the county in parliament, and were originally inhabitants of the places for which they were chosen. See PARLIAMENT.

The ceremonies practised in conferring knight-hood have varied at different periods. In general, tenures in England (see KNIGHTS), which was

abolished in the time of Charles II., and converted into Frechold (q. v.).

KNIGHTS TEMPLARS. See TEMPLARS. KNIPPERDOLLING, BERNARD, a noted leader of the fanatical Anabaptists of the 16th century.

See Anabaptists. KNITTING, an art allied to weaving, but of comparatively modern date. The time and place of its invention are disputed. Some historians insist upon Scotland having the honour, at a date somewhat before the year 1500; others assert that it came from Spain, in the time of Henry VIII.; but there is no proof that the silk stockings which were worn by that monarch were knitted, and in the absence of such proof, the weight of evidence remains in favour of Scotland. Knitting consists in using a single thread, and with it forming a continual series of loops across the whole fabric; the next row passes through these, and they in their turn receive another set, until the whole is completed. Knitting is only employed to make small articles, such as stockings, gloves, &c.; and as it furnishes an easy and amusing employment for the hands, without engaging the attention much, it forms a useful and desirable occupation for ladies

and others who do not require knitted articles as

necessaries, for the knitting-machines have now rendered it impossible for hand-work to compete

with them in point of economy or beauty of workmanship. See Hostery.

KNOT, an expression used in speaking of a ship's way through the water, and, as such, repre-senting miles. The log-line is divided by knots into lengths, each of which is to a geographical into lengths, each of which is to a geographical mile as half a minute is to an hour—i. e., as I to 120. The log being cast overhoard, note is care-fully taken of how many of these knots run out in a half minute, and it follows that the vessel is a han minute, and it follows that the vesser is passing through the water at the same number of geographical miles per hour. The proportion of a geographical to a statute mile being nearly that of 7 to 6 (see MILE), a vessel making 12 knots an hour, is in reality travelling at the rate of 14 statute miles.

KNOT, a twist or loop in a rope or cord, so made that the motion of one piece of the line over the other shall be stopped. The knot owes its power of passive resistance to the friction of the rope. The uses of knots are infinite; in the commonest occasions of life, one or two simple knots are indispensable; in building, mining, and almost every land occupation, knots of curious form are employed; while on shipboard, knots may be almost numbered by the dozen, and each is appropriated to a specific duty. The accompanying diagrams of some of the simpler knots may be generally useful. In these, the position of the rope or cord is shewn before tightening, so that the mode of formation may be more readily understood.

The simplest knot is the 'overhand' (fig. 1). Its

use is to form a knob in a rope to stay it from families as heraldic badges, and are occasionally slipping. By a slight alteration, the 'single sling,' introduced as charges in shields. The forms of

or slip knot (fig. 2), is obtained, always in the middle of the rope. More complicated, but still more useful, is the 'double sling' (fig. 3), for suspend-ing a beam or bar horizontally. The bowline knot fig. 4) serves to give a tight grasp round a pole or beam, which would occupy the loop α, or, drawn close on the rope, it forms a large knob, to prevent the rope passing a hole. The sheepshank (fig. 5)

affords a means of shortening a rope temporarily, without diminishing its power of rectilineal tension. All the foregoing have been at the double or middle parts of the rope: for the end of the cordage, fig. 6 shews an admirable ship-knot, which maintains its snews an admirator sup-knot, which maintains its gripe until loosened by hand; α is a common over-hand knot at the end of the string, to prevent it shpping through the loop b, when tightened.

For modes of joining two ropes, the weaver's or fisherman's knot (fig. 7) may be adduced as strong

and neat. The sailor's knot (fig. 8) has the advantage, when properly made, of resisting all separating strain on the two ropes, and at the same time of being loosened immediately by a pull at one of the short ends. For an inter

lacing of two doubled ropes, the 'Carrick bend' (fig. 9) has no superior; the point of junction cannot slip, and the moment the tension ceases, the two ropes are again free from each other. Knots have many technical names.

such as hight, hitch, &c.

KNOT-GRASS. See POLYGONUM. KNOTS of different kinds are borne by different

Knots: Wake and Ormonde knot; 2, Lavy knot; 3, Bowen knot
 Henenge's knot; 5, Daere's badge.

some of them appear to be suggested by the initial is no question connected with knowledge that does letter of the name or title of the bearer. In the Wake and Ormonde knot (fig. 1), it is not difficult to trace a W and two Os. The Bourchier knot, as seen on the tomb of Archbishop Bourchier, at Canterbury, bears a resemblance to two Bs, and the Stafford knot to two Ss. The Lacy knot (fig. 2) contains within it a rebus on the four letters of the name Lacy.

KNOUT, a scourge composed of many thongs of skin, plaited, and interwoven with wire, which was till lately the favourite instrument of punishment in Russia for all classes and degrees of criminals. The offender was tied to two stakes, stripped, and received on the back the specified number of lashes ; 100 or 120 were equivalent to sentence of death, but in many cases the victim died under the operation long before this number was completed. This punishment is at the present time inflicted only upon ordinary criminals, such as incendiaries or assassins. It is no longer in use in the army, except when a soldier is dismissed for ill conduct, in which case three to ten lashes are given, in order to disgrace the soldier, rather than punish him. The whipping is inflicted by a criminal, who prefers this office to exile to Siberia, and who is constantly kept in prison, except when his services are required. The nobility are legally exempt from the knont, but this privilege has not always been

KNOWLEDGE. This term of common use is associated with the greatest problems and controversies of philosophy. The Perception of the External or Material World (see Common Sense, Perception), the nature of Belief (see Bellef), the ultimate analysis of a Proposition or Judgment (see JUDGMENT), are all involved in the discussion of what is meant by knowledge. Moreover, we may, in connection with this word, take up the consideration of Thought or Intelligence on the whole, in contrast to the feelings and volitions (see INTELLECT). In a still different phase of meaning, we may be led to consider the nature of Science or Philosophy, two features of being generalised, as distinct from individual or particular facts, and being verified or attested by careful evidence, in contrast to the loose assertions that satisfy the ordinary run of mankind.

A distinction, considered by Sir W. Hamilton and others to be of great importance in metaphysical philosophy, is that of Immediate or Presentative, and Mediate or Representative Knowledge. The one is the knowledge or cognizance that we have of the medifications of our own minds, so to speak, without inferring anything beyond, as in our various sensations and emotions. When we are affected by cold or heat, hunger, thirst, odour, or sound, we are conscious of a something, which may be said to be wholly contained in our own minds; but when a present modification of the mind is looked upon not for its own sake, but as bodying forth something more than itself, as in memory, our knowledge is then said to be mediate. Thus, an actual sensation tion is mediate and representative. Mr Mansel makes this distinction the basis of his division of the mind. 'Consciousness,' he says, 'in its relation to the person conscions, is of two kinds; or rather, is composed of two elements-the presentative, or intuitive; and the representative, or reflective. phenomena of the former class may be distinguished by the general name of Intuitions; those of the latter, by that of Thoughts.

It will appear from the above remarks that there

not fall to be discussed under some other head: and as a general rule, it is best to take up the difficult problems of the philosophy of mind under those names that severally suggest each is its singleness. instead of confusing a multitude together.

KNOWLES, JAMES SHERIDAN, an English dramatist, was the son of James Knowles, an eminent teacher of elecution, and author of a Dictionary of the English Language. He was born at Cork in 1784. The family removed to London in 1792, and here young K. received his education, After holding for some time a commission in the army, he became an actor, and made his first appearance at the Crow Street Theatre, Dublin: but he never attained much eminence in this profession. Subsequently, he lived for several years in Belfast and Glasgow, as a teacher of elecution, and it was at this time he laid the foundation of his fame as a dramatist. His Caius Gracchus was first performed at Belfast in 1815. It was followed by Virginius, his most effective piece, afterwards recast for the London stage, where Macready took the principal part. He wrote thirteen other plays, but none of his productions exhibit great genius; they are, however, unquestionably the best 'acting plays' produced by an Englishman in modern times. About the year 1845, he relinquished the stage from religious scruples, and in 1852 joined the Baptist body. He latterly distinguished himself by his religious zeal. In 1851, he published a little conrengious zeat. In 1851, he phonshed a little con-troversial work, displaying considerable acuteness and ability, The Idol Demolished by its own Priest, in answer to Cardinal Wiseman's Lectures on Transubstantiation. K. died at Torquay, in Devonshire, in December 1862.

KNOWLTO'NIA, a genus of South African plants, of the natural order Ranunculaceae, with flowers resembling those of Adonis, and succulent fruit. K. resicatoria, which has bi-ternate leathery leaves, and flowers in few-flowered umbels, is remarkable for its acridity and blistering power. The bruised leaves are used at the Cape of Good Hope instead of cantharides; they raise a blister in half an hour, and it keeps open a long time. The sliced root seems to be still more powerful.

KNOX, John, the great Scottish reformer, was born in the year 1505, in a suburb of Haddington called Gifford Gate, where a small field still goes by the name of 'Knox's Croft.' The social position of his parents is not very clearly ascertained. His own statement is, that 'his great-grandfather, gudeschir, and father served under the Earls of Both-He is supposed to have come of an old and respectable family, the Knoxes of Ranfurly, in Renfrewshire. He received his early education at the grammar-school of Haddington, and in the year 1521 went to the university of Glasgow. He was there a pupil under Major, and soon proved himself an apt and distinguished disputant in the scholastic theology. He was considered as likely to rival his master in the subtleties of the dialectic art. From the same teacher, he no doubt derived his first impulse to that freedom of political opinion and independence of thought that afterwards characterised him. He is said to have been ordained before the year 1530, about which time, or shortly afterwards, he went to St Andrews, and began to teach there. There is, however, at this stage of his life a gap of twelve years, or nearly so, which the most careful research has hitherto failed to till up. His attachment to the Romish Church is supposed to have been shaken chiefly by the study of the Fathers, about 1535; but he did not openly profess himself a Protestant till about 1543. He

was degraded from his orders, and being even in danger of assassination, took refuge with Donglas of Longniddry, and there remained till the end of 1545

Cardinal Beaton was at this time in the height of his power: after seizing George Wishart at Ormiston, he had him brought to St Andrews, and burned there, in front of his castle, March 1546. K. first clearly appears upon the scene of the Reformation as the companion of Wishart. While the latter prosecuted his career as a preacher in Lothian, K. waited upon him, bearing before him, he tells us, a 'twa-handed sword.' He already coveted the post of danger, and full of enthusiasm, was ready post of danger, and that of entaustasm, was ready to defend his zealous friend at the peril of his own life. After Wishard's seizure and death, he with-drew for a while again into retirement. He would fain have clung to the martyr, and shared his fate, but the latter would not have it so. 'Nay.' he and i'return to your bairnes, and God bless you : ane is sufficient for a sacrifice.' Knox's 'bairnes' were his pupils, the sons of the Lairds of Longniddry and Ormiston. He continued in charge of them for some years, till the great event which ere long followed the martyrdom of Wishart opened up a more prominent career for him. On the morning of the 29th May 1546, Cardinal Beaton was murdered in his castle, from the windows of which he had contemplated the sufferings of the martyr. Taken possession of by the band of nobles and others who had successfully accomplished so andacions a design. the castle at St Andrews became the temporary stronghold of the Reforming interest. refuge in it with his two pupils. Here his great gifts as a preacher were first discovered; and having found the secret of his influence, the parish church of St Andrews soon resounded with his indignant voice, denouncing the errors of popery. His career at this time, however, was soon cut short by the surrender of the fortress, and his imprisonment in the French galleys.

For two years he remained a prisoner, and underwent, in the course of this time, many privations. He was then liherated, and allowed to depart to England, where he resided for four years, from 1549 to the beginning of 1554, a time of great and fruitful activity to him. He was appointed one of Edward VI.'s chaplains, and lived on terms of intimate intercourse with Cranmer and others of the English reformers. He is supposed to have had considerable influence on the course of the English Reformation, especially in regard to the liberal changes introduced into the Service and Prayer Book of the Church of England, in the close of Edward's reign. He was much engaged in preaching, especially in the north, in Newcastle and Berwick; and at the latter place he fell in love, and

married.

The accession of Mary drove him and others to the continent. He was reluctant to flee, but 'partly by advice and partly by tears, he was compelled to consult his safety. He settled temporarily at Dieppe, whence we hear of him writing an Admoni-tion to the Professors of God's Faith in England. He then went into Switzerland, and returning, settled for some time at Frankfurt-on-the-Maine, where he is notable in connection with what are known as the 'Frankfurt Troubles,' certain disputes as to the use of King Edward's Service-Book in the congregation of English Protestants there. Towards the end of 1555, he made a rapid visit to Scotland, where he did much to encourage the cause of the Reformation. Convinced, however, that the 'time of deliverance' was not yet come for his country, he retired once more to Geneva, where he settled as paster of a congregation for nearly three years, Geneva. But the bright prospect on which he gazed

which were among the quietest, and probably the

happiest years of his life.

Recalled to Scotland in May 1559, he then entered upon his triumphant course as a reformer. Political necessities had driven the Queen-regent to temporise with the 'Lords of the Congregation,' or the reforming nobles. Having somewhat re-established her power, she wished to withdraw her concessions; but the reforming impulse had gathered a strength that could no longer be resisted. The heads of the party could no longer be resisted. The heads of the party assembling at Dundee, under Erskine of Dun, pro-ceeded to Perth. There the pent-up enthusiasm which had been long collecting was roused into furious action by a sermon of K. on the idolatry of the mass and of image-worship. A riot ensued. The 'rascal multitude,' as K. himself called them, broke all bounds, and destroyed the churches and monasteries. Similar disturbances followed at Stirling, Lindores, St Andrews, and elsewhere. The flame of religious revolution was kindled throughout the country, aggravating the civil war already raging. At length the assistance of Elizabeth and the death of the Queen-regent brought matters to a crisis; a truce was proclaimed, and a free parliament summoned to settle differences. The result of the parliament, which met in August 1560, was the overthrow of the old religion, and the establishment of the Reformed kirk in Scotland. In all this, K. was not only an active agent, but the agent above all others. The original Confession of Faith of the Reformed Kirk and the First Book of Discipline bear the impress of his mind. He was far from attaining all his wishes, especially as to the provision for the support of the church and of education throughout the country; he soon found that many of the nobles were far more zealous for destruction than for reformation; still, he acconiplished a great and radical work, which was only

destined to be consolidated after many years.

The arrival of the youthful Queen Mary, in the course of 1561, brought many forebodings to the Reformer; he apprehended great dangers to the Reformed cause from her character and her wellknown devotion to the Romish Church. Reformer's apprehensions scarcely permitted him to be a fair, certainly not a tolerant judge of Mary's conduct. Misunderstandings very soon sprung up between them, and he relates, with a somewhat harsh bitterness, his several interviews with her. At length he came to an open rupture with the queen's party, including Murray and Maitland, and many of his former friends. He took up an attitude of unyielding opposition to the court, and in his sermons and prayers, indulged freely in the expression of his feelings. The result was his temporary alienation from the more moderate Protestant party, who tried to govern the country in the queen's name. For a while, from 1563 to 1565, he retired

into comparative privacy.

The rapid series of events which followed Marv's marriage with Darnley-the revolt of the dissatisfied nobles, with Murray at their head, the murder of Rizzio, and then the murder of Darnley (1567), the queen's marriage with Bothwell, her defeat and imprisonment, served once more to bring Knox into impresement, served once more to oring Knox into the field. He was reconciled with Murray, and strongly abetted him in all his schemes of policy during his regency. Further reforms were effected by the parliament which convened under his sway in the close of 1567. The sovereign was taken bound to be a Protestant, and some provision, although still an imperfect one, was made for the support of the Protestant clergy. K. seemed at length to see his great work accomplished, and is said to have entertained the idea of retiring to

for a little was soon overcast -Murray's assassina- scarcely any rudiment of a tail. The general form tion, and the confusion and discord which sprung is not unlike that of a young bear. out of it, plunged the Reformer into profound grief He once more became an object of suspicion and hostility to the dominant nobles, and misunderstandings even sprung up between him and some of his hrethren in the General Assembly. He retired to St Andrews, for a while, to escape the danger of assassination with which he had been threatened. There, although suffering from extreme debility, he roused himself to preach once more, and in the parish church where he had begun his ministry, made his voice to be heard again with something of its old power. Assisted by his servant, the 'good godly Richard Ballenden,' into the pulpit, 'he behoved to lean upon it at his first entry; but ere he was done with his sermon, he was so active and vigorous, that he was lyke to ding the pulpit in blads and the out of it.

In the end of 1572, he returned to Edinburgh to die; his strength was exhausted; he was 'weary of the world,' he said; and on the 24th of November

he quietly fell asleep.

K.'s character is distinguished by firmness and decision, and a plain, somewhat harsh sense of reality. He was a man of strong, and even stern convictions, and he felt no scruples, and recognised no dangers in carrying out his convictions. He was shrewd, penetrating, inevitable in his perceptions and purposes. No outward show, or conventional pretence, deceived him; he went straight to the heart of everything; and consistently with this clear and rough shrewdness of perception, his language is always plain, homely, and many will say harsh. He had learned, he himself says, 'to call wickedness by its own terms -a fig, a fig; a spade, a spade.' Above all, he was fearless; nothing daunted him; his spirit rose high in the midst of danger. The Earl of Morton said of him truly, as they laid him in the old churchyard of St Giles : 'He never feared the face of man.' In Scotland, K., no doubt, accomplished a great work. Whether the work would not have been better if it had been less violently done, if the spirit of love and moderation, as well as the spirit of power, had presided over it, is a question regarding which there may be much division. But even if we should take exception to some things he did or encouraged, we may admire the consistent boldness, the deep earnestness, and the self-denying, unflinching zeal of the great Reformer.

KNO'XVILLE, a city of Tennessee, United States of America, on the north bank of the Holston River, at the head of steam-boat navigation, 185 miles east of Nashville. It is the principal and central town of East Tennessee, on the East Tennessee, Georgia, and Virginia Railway. It is the site of the university of East Tennessee, the state Deaf and Dumb Asylum, and has 3 academies, 5 churches, 4 newspapers, and several flouring-mills and glass factories. Pop. in 1860, about 6000.

KNU'TSFORD, a small market-town of Cheshire, 23 miles east-north-east of the city of Chester. Pop. 3575. The name is said to be derived from King t'anute, or Knut, having with his army forded

KO'ALA (Phascolardos cinereus), a marsupial quadruped, commonly referred to the family Phalangistider, and pretty nearly resembling the phalaagers in dentition, but having the molar teeth much groups, of two and three, a character not found in the branches of trees, on which the K. often hangs with its back undermost, like the sloth. There is of St. Paul, on its north-east coast.

Kuala (Phascolarctos cinereus).

carries her young on her back, for a long time after it is capable of leaving her pouch.

KO'BBE, a town of Central Africa, See DARFUR.

KOBOLDS. See GOBLINS AND BOGLES.

KOCH, KARL HEINRICH EMMANUEL, a celebrated traveller and naturalist, was born at Weimar in 1809. He studied at the universities of Würzburg and Jena, and in 1836, undertook a scientific journey to Southern Russia, completing his researches in a second journey, which he performed in 1843, this time visiting also Turkey, Armenia, Pontus, the Caspian Sea, and the range of the Caucasus. In 1839, he was appointed Professor of Botany in the university of Jena. The most important of his works are—Monographia generis l'eronice (Würzburg, 1833); Reise durch Russland nach dem Kaukasischen Ishmus (Journey through Russia as far as the lsthmus of the Caucasus, Stuttgart, 1842-1843). His second journey supplied the materials for Wanderungen in Oriente (Wanderings in the East, Weimar, 1846—1847;) and Beiträge zu einer Flora des Orientes (Flora of the Levant), 1848-54, The Crimea and Odessa, 1854, and other works on geography, botany, and topography.

KOCK, CHARLES PAUL DE, a French novelist, dramatist, and poet, born at Plassy, near Paris, in 1794, is the son of a Dutch banker, who perished on the scaffold during the French Revolution. Originally intended for a mercantile career, he devoted himself to literature against the wishes of his relatives. His novels, though displaying no trace of real genius, have acquired an unenviable notoriety by the licentious freedom of their representations, K. has composed upwards of 50 novels, besides a great number of vandevilles and stories in verse. His earlier works, in a literary point of view, are considered superior to his later ones. Among others, we may mention Georgette, on la Nièce du Tabellion; Gustave, on le mauvais Sujet; Le Barbier de Paris; La Femme, le Mari et l'Amant; Morars Parisiennes .- HENRI DE KOCK, son of the preceding, like Dumas fils, has unhappily followed his father's footsteps, if we may judge from the titles of some of his novels: Le Roi des Etudiants et la Reine des Grisettes, Les Amants de ma Maîtresse, Lorettes et Gentilshammes, &c.

KO'DIAK, an island on the east side of the peninsula of Alaska (q. v.), containing the oldest settlement in what was formerly termed Russian America, as distinguished at least from the Alentian Archipelago. It is little better than an irregularly shaped mass of mountains, measuring 75 miles by 50, The chief value of K, consists in the tolerable harbour

KOHA'T, a town of the Punjab, stands in lat. 33° 32' N., and long 71° 27' E., in a small but fertile and populous mountain-valley of the same name, which forms an administrative district. miles to the cast of it are springs of naphtha, and rich and extensive deposits of sulphur. K. is traversed by two important routes—the route from Peshawur to Kala Bagh, and another by Bungush to Khorassan

KOH-I-NUR (Mountain of Light), the name of a large diamond now in the possession of Her Majesty Queen Victoria. According to Hindu legend, it was found in a Golconda mine, and its possessors have, with few exceptions, been the rulers of Hindustan. After belonging successively to the Bahmani, Khilji, Lodi, and Mogul kings, it came, in 1739, into the hands of Nadir Shah, who came, in 1739, into the hands of Nadir Shah, who gave it its present designation. From him it went to the Abdali monarchs of Afghauistan, the last of whom, Shah Sujah, gave it to Runjeet Singh, the ruler of the Punjab. On the abdication of the Maharajah Dhuleep Singh, and the annexation of the Punjab in 1849, it was surrendered to the sovereign of Great Britain. It is said to have sovereign of Great Britain. It is said to have weighed originally 900 carats, but, after heing cut, was reduced to 279 carats. It was reduced by recutting to 186 carats, and in this state was shewn at the Great Exhibition of 1851; since which time it has been again recut (1852), and now weighs about 123 carats, and has been valued at £120,664. The Koh-i-nûr is rose-cut.

KOHL, JOHANN GEORG, an eminent German traveller and author, was born at Bremen, April 28, 1808; studied at Göttingen, Heidelberg, and Munich; and settled in Dresden, in 1838, from which place as a starting-point, he made excursions in all directions, visiting every important district of Europe, and on his return from each expedition, published his experience in a series of works. In 1854, he went to America, where he travelled for four years, and returned to Germany. His works on Earope are so numerous and well known that a full detail of them is unnecessary; suffice it to say, that he has described the countries of Austria (1842), Bavaria (1842), England (1842 and 1844), Russia (1846-1847), Denmark (1846 and 1847), Istria, Dalmatia, and Montenegro (1851), &c. The results of his American experience were published in Travels in Canada (1855), Travels in the United States (1857), and Kitahi-Gami, or Tales from Lake Superior (1860). Another work of K. is the History of and Commentary on two Maps of the New World made in Spain at the Commencement of the Reign of Charles V. (1861), which cost him two years' intense labour. In 1857 he lectured on the History of American Geography before the Smithsonian Institution at Washington. See Rep. for 1856.

KOHL-RABI, or, more properly, KOHL-RÜBÉ (Germ. Kale-turnip, similarly called Chou Rave by the French), a cultivated variety of the Kale or Cabbage (Brassica oleracea), distinguished by the swelling of the stem just above the ground, in a swelling of the stem just above the ground, it is globular form, to the size of a man's fist, or larger, leaf-stalks springing from the swollen part, and allow to the mognificative of its appearance. This adding to the peculiarity of its appearance. This is the part which is used, and its uses are similar to those of the turnip. In quality, it more nearly resembles the Swedish than the common turnip, and the use of it for feeding cows does not give their milk a disagreeable flavour, as when they are fed on turnips. K. is very hardy, its leaves, as well as its stem and root, enduring the most severe winters, although in Britain its cultivation has hitherto been unimportant. Among his principal works must be chiefly in the south of England. It is a common lammed his Mirosbopecke Anatomic: Handbuch der

field-crop in Sweden. In the cultivation of K., it is usual to sow it on seed-beds, and to transplant by dibbling into fields; but this is perhaps not the best mode. It ought, however, to be sown earlier than even Swedish turnip; and raised drills are unsuitable for it, owing to the effect of winds. It is more solid and more nutritious than any kind of turnin of the same size. There are numerous sub-varieties. K., like all the varieties of Brassica oleracea, delights in a strong rich soil and abundant manure.

KOKRA WOOD, or COCUS WOOD, the wood of an Indian tree, Lepidostachys Roxburghii, which belongs to a very small natural order, Seepacea, remarkably allied at once to Euphorbiacea and to Amentaesa. K. W. is imported into Britain in logs of six or eight inches in diameter, having the heart-wood of a rich deep brown colour and hard. It is much used in the manufacture of flutes and other musical instruments. The Kokra-tree has leathery, alternate leaves.

KO'LA, a place of scarcely 800 inhabitants, but worthy of notice as the most northern town of European Russia, and except Wardoe, in Norway, the most northern in Europe. It is situated between the Kola and its tributary, the Tuloma, not far from the Icy Sea, and has a secure and capacious harbour. The inhabitants are Russians, Lapps, and Finns, and are chiefly occupied with walrus. whale, and cod fishery.

KOLA NUT. See COLA NUT.

KOLAPU'R, the chief, or rather the only town of a protected state of the same name within the presidency of Bombay, 130 miles to the south of Poona. The population has not even been esti-Poona. The population has not even been esti-mated. The raj, or state, is estimated to contain 3445 square miles and 500,000 inhabitants, composed of Mahrattas and Ramusis. Since 1844, when the East India Company virtually took possession, K. has considerably advanced in prosperity.

KOLIAZI'N, a town in the government of Tver. European Russia, situated on the right of the Volga, carries on an extensive trade in corn, tallow, and linen. Pop. 7558.

KOLLÁR, John, one of the most conspicuous Slavic poets and scholars, was born, in 1793, at Moschowze, in the north-west of Hungary, studied at Presburg and Jena, and in 1819 became pastor at resourg and seen, and in 1919 became passor of a Protestant congregation at Pesth. His first work was a volume of songs and poems entitled Basse (Poems, Frague, 1821); this was followed by his Stawy Deera (The Daughter of Glory, Buda, 1824; 3d ed., Pesth, 1832), regarded by his countrymen as his greatest work; and Resprency experiences of the Protest Protest Control of the Protest Protest Control of the Protest Prot Imenach (Treatises on the Name and Antiquities of the Slavic People and their Ramifications, Buda, 1830). K.'s fame, however, rests more on his being one of the earliest and most zealous advocates of Panslavism (q. v.). The work in which this tendency first appears was written in German, and is entitled Ueber die literarische Wechselseitigkeit zwischen den Stämmen und Mundarten der Slav. Nation (Pesth, Stammen und Municarea der Saus. Pranon (s. com.) 1831). The revolution in Hungary compelled him to abandon his country. He withdrew to Vienna, where he was made Professor of Archæology in 1849. He died January 29, 1852.

KÖLLIKER, ALBRECHT, a German physiologist, was born in 1817, and is at present Professor of Anatomy and Physiology in the university of Würzburg. He is principally distinguished by his labours in the department of microscopic anatomy, and on the development of the embryo; but his contribuGenerhelekre des Menschen (which has been translated for the industry of its inhabitants, and for the for the Sydenham Society by Bank and Huxley, gold-trade which is there carried on...—The town of under the title of A Manual of Human Histologys, K., in lat S 33 N., and long 3 N. y, is situated for the Sydenham Society by Busk and Hildey, under the title of A Manual of Human Histology, in two volumes; Die Siphonophora oder Schwinn-polypen von Messina: and Entwickelungsgeschichte des Menschen u. d. hoheren Thiere. In association with Von Siebold, he is also the editor of Zeitschrift für wissenschaftliche Zoologie, the most important scientific natural-history journal of Germany.

KOLLI'N, or NEU-KOLIN, a town of Bohemia, on the Elbe, about 35 miles east of Prague, with a population of 6200, is noted for the great battle fought, June 18, 1757, in its vicinity, between 60,000 Austrians under Marshal Daun, and 32,000 Prussians under Frederick II. The latter were defeated in spite of the obstinate valour of their monarch, who charged at the head of his cavalry seven times in succession.

KOLOME'A, a town of Austrian Galicia, is situated on the Pruth, at the base of the Carpathian Mountains, 112 miles south-south-east of Lemberg. It is a very old towa, and formerly carried on an extensive trade. Pottery is still largely manufac-tured. Pop. 13,400, half of whom are Jews.

KOLO'MNA, a district town of Great Russia, in the government of Moscow, is situated 62 miles south-east of the city of that name, on the river Moskva. It contains 13,703 inhabitants. con munications by water between it and Nijni-Novgorod and Moscow, and the railway already completed from Moscow to this town, and to be carried on to Riazan, have already increased the trade of the district. Weaving, silk-spinning, and cotton-printing are carried on, with manufactures of cotton and leather.

KOLYMA', a river in Eastern Siberia, flowing from the Stanovoy Mountains, among which it takes its rise in lat. 61° 5' N. After a north-east course of 1(00) miles, it falls into the Arctic Ocean in lat. 69° 40′ N.

KOLYVA'N, a town in the government of Tomsk, in Siberia, situated on the river Ob, lat. 55° 21' N., and long. 82' 46' E., is remarkable for the extensive quarries of jasper in its neighbourhood. There is also a large manufactory of jasper ornaments, which belongs to the Russian government. Pop. 2172.

KOLZOW, ALEXEI VASSILIEVICH, a Russian poet, prematurely cut off in the early bloom of his genius, most of whose songs are among the choicest pearls of Russian poetry, was the son of a cattle-dealer, and was born in Voronesh in 1809. After a merely rudimentary education, he was employed by his father in feeding cattle on the steppes in summer, and in winter in attending the markets. His familiarity with the scenes of the steppes appears in all his poetry. His love of poetry was early developed, and the talent displayed in some of his earlier effusions, obtained for him the patronage of some of the most zealous cultivators of Russian literature. He was just about to settle in St Petersburg, and to devote himself exclusively to literary pursuits, when he suddenly died, in 1842. A complete edition of his poems, with a biography of the author, was published by Belinsky in 1846.

KONG, a name applied to a mountain-range, a district, and a town, all of which are situated northward from the coast district, in the west of Northern Africa. The mountains extend from west to east at the distance of about 200 miles from the shore of the Gulf of Guinea, and are said to be an offset from the high table-land of Senegambia. Little is known regarding them. The highest known summits reach an elevation of only 2500 feet.—Regarding the K. district, all we know is, that it is remarkable

among hills 540 miles south of Timbuktu. It is a large town, consisting entirely of clay-houses, and is the centre of numerous converging caravan routes. The inhabitants, who are chiefly Mandingoes, and of the Mohammedan religion, manufacture cottoncloths extensively.

KO'N1EH, a large town of Asiatic Turkey, capital of the province of Karaman, situated in a rich, well-watered plain, in lat. 37° 54' N., and long. 32 40' E. It is surrounded by walls from two to three miles in circuit, built from the ruins of ancient Seljuk edifices, and surmounted by square towers. Its numerous minarets, and its mosques and other public buildings, give it an imposing appearance, but like most of the towns of Asia Minor, it is now in a sadly ruinous condition. Many interesting remains of Saracenic architecture, however, are still to be met with. K. is the chief emporium for the products of the interior. Carpets and coloured merocco leather are manufactured, and cotton, wool, and skins are exported to Smyrna. Pop., including the suburbs, 50,000.

K., the ancient Iconium, was famous in ancient times as the capital of Lycaonia. From 1087 to 1299, it was the seat of a Seljuk sultanate. On December 20, IS32, a battle was fought here, in which Ibrahim Pasha completely defeated the Turkish army.

KONIG, FRIEDRICH, the inventor of the steampress, was the son of a respectable citizen of Eisleben, and was born there, 17th April 1775. He became a printer, and was also for a short time a bookseller, but was unsuccessful in this business. He eagerly prosecuted literary and scientific studies. Having devoted himself to the invention of means of printing by machinery, he applied in vain for the necessary pecuniary assistance in various quarters, his schemes being rejected as impracticable; but at last Thomas Bensley, a printer in London, came forward to his support, a company was formed, and a patent was obtained on 29th March 1810, for a press which printed like the hand-press by two flat plates, and in 1811 it was first used to print part of the Annual Register. A second patent was obtained on 30th October 1811 for a cylinder-press, a third in 1813 for improvements upon it. This improved machine was soon adopted by the proprietors of the *Times*, and on 29th November 1814, that newspaper appeared for the first time printed by machinery which was moved by a steam-engine. In the latter part of his life, K. was a partner in a company for making steam printing-presses at Oherzell, near Würzburg, in Bavaria. He died 17th January 1833.

KO'NIGGRATZ, a town and fortress of Bohemia, on the left bank of the Elbe, at the confluence of the Adler with that river, 64 miles cast-north-east of Prague. It is the seat of a bishop, and has a beautiful cathedral. On July 2, 1866, the Austrians under Gen. Benedek were signally defeated with a loss of 40,000 men by the Prussians under King William, at Sadowa, near Königgrätz, Pop. 8300.

KÖ'NIGINHOF, a small manufacturing town of Bohemia, on the left bank of the Elbe, 16 miles north of Königerätz. Linen-weaving, tanning, and manufactures of hats and sugar, are the principal branches of industry. Pop. 5000.

KO'NIGSBERG, a small town of Prussia, in the province of Brandenburg, on the Rörike, 45 miles north of Frankfurt-on-the-Oder. Tanning and distilling are the chief branches of industry. Pop. 5000. Numerous other places in Germany bear this

KÖNIGSBERG, an important town and fortress of Prussia, in the province of East Prussia, is situated on both banks of the Pregel, and on an island in that river, four miles from its entrance into the Frisches Haff. It consists of the Old Town and the Löbenicht on the north bank (the latter of which, in its sevenstoried and gabled houses, and steep side-lanes, still presents a completely Hauseatic appearance). the Kneiphof on the island (also one of the oldest parts), and numerous suburbs. The Pregel is here crossed by seven bridges. The origin of the town dates from the erection of a castle by Ottokar, king of Bohemia, in 1257. K. became a member of the Hanseatic League in 1365, and was the residence of the grand-master of the Tentonic Order from 1457 to 1528. In 1701, Frederick, Elector of Brandenburg, was crowned here, with the title of Frederick I., King of Prussia. Its chief buildings are the cathedral, containing the tomb of Kant; the university, founded in 1544, and attended now by about 350 students; the united Royal and University Library, with 160,000 volumes; the observatory which the labours of Bessel have rendered famous, and other educational and benevolent institutions. Imtobacco are carried on. Wine, fruits, coal, salt, and sugar are imported; grain is the chief article of export. K. occupies the fourth rank among Prussian towns in respect of population. Pop. (1867) 106,296.

KONRAD or CONRAD I., king of the Germans (a title identical with the subsequent one of 'Emperor of Germany'), was the son of Konrad of Fritzlar, Count of Franconia, and the nephew of the Emperor Arnulf. On the extinction of the direct line of the Carlovingians, the Germans resolved to make the sovereign dignity elective, and preferring to choose one who was related to the late imperial family, offered the crown to Otho the Illustrious, Duke of Saxony, who refused it, but recommended K., who was accordingly elected in 911. The new monarch gradually re-established the imperial authority over most of the German princes, carried on an unsuccessful war with France, and at last fell mortally wounded at Quedlinburg (918), in a battle with the Hungarians, who had repeatedly invaded his dominions. He hes buried at Fulda. On his deathbed, he enjoined his brother Eberhard to carry the imperial insignia to his mortal enemy, Duke Henry of Saxony, son of Otho the Illustrious, with whom he had been continually at war since 912 A. D., and accompanied the gift with the chivalrous message, 'that he wished to render to the son what he had received from the father.' K.'s reign was a remarkable epoch in the history of Germany; sovereignty by hereditary right was introduced into the German duchies and markgrafdoms; the minor lords of the soil became vassals. not to the king, as formerly, but to their dukes; and finally, the crown-lands in each duchy were taken possession of by the dukes themselves, who thus totally destroyed the sovereign's local jurisdiction.

KONRAD II., king of the Germans, and Roman emperor, was elected after the extinction of the Saxon imperial family in 1024. He was the son of Henry Duke of Franconia, and is by many considered as the founder of the Franconian dynasty. Immediately after his election, he commenced a tour through Germany, to administer justice and acquaint bimoself with, and, if necessary, to ameliorate, the condition of his subjects. With a view to this last, he instituted the God's Truce (q. v.). In 1026, he crossed the Alps, chastised the rehellious Italians,

his wife Gisela were anointed emperor and empress his whe cussua were anomice emperor and empress of the Romans by the pope. He was soon recalled to Germany to put down four formidable revolts, in which he succeeded so well, that by 1033 peace was restored. In 1032, he had succeeded to the kingdom of Burgundy, which he annexed to the empire. In 1036, a rebellion in Italy again compelled him to cross the Alps; but his efforts to restore his authority were this time unsuccessful, and he was forced to grant various privileges to his Italian subjects. Shortly after his return, he died at Utrecht, 4th June 1039. K. was one of the most remarkable of the earlier monarchs of Germany. He repressed the more obnoxious features of the feudal system, and by conferring the great duehies of Bavaria, Swabia, and Carinthia on his son, reduced the dangerous power of the great dukes of the empire.

KONRAD III., king of the Germans, the founder of the Hohenstaufen (q. v.) dynasty, was the son of Frederick of Swabia, and was born in 1093. While under 20 years of age, K., with his elder brother Frederick, had bravely supported Henry V. against his numerons enemies, and in return, that monarch granted K. the investiture of the duchy of Franconia. He subsequently contested the crown of Italy with the Emperor Lothaire of Saxony, but was compelled to resign his pretensions. On the death of Lothaire, the princes of Germany, fearing the increasing preponderance of the Guelf party, and attracted by his brilliant courage, moderation, and goodness, offered K. the crown, and he was accordngly formally elected at Aix-la-Chapelle, 21st February 1138. He was immediately involved in a quarrel with Henry the Proud, Duke of Bavaria and Saxony, and head of the Guelf party in Germany; and the struggle was continued under Henry son and successor, Henry the Lion (q. v.). Whi son and successor, menry the Laon (q. v.). while Germany was thus convilled, the state of Italy was not a whit more peaceable. The several belli-gerents besought K.'s assistance, but he well knew the natural meonstancy of the Italians, and deter-mined to stand aloof. Soon after this, St Bernard of Clairvaux commenced to preach a new crusade, and K., seized with the general infatuation, set out for Palestine at the head of a large army (see CRUSADES) in company with his old enemy, Guelf of Bavaria. Guelf returned to Germany before K., and with his nephew, Henry the Lion, immediately renewed the attempt to gain possession of Bavaria, but their army being defeated at Flochherg, they were compelled to sue for peace. K. was now called upon to aid the Duke of Poland against his reblius to an the Duke or round against his rebellmous subjects, and the pope and the northern Italians against Roger of Sicily; but while preparing for this latter expedition, he was poisoned, 15th February 1152, at Bamberg. K. was largely endowed with the virtues necessary for a great monarch, and though himself unlearned, was a warm patron of science and latter. His warmers with a Grack science and letters. His marriage with a Greek princess was symbolised by the two-headed eagle which figured on the arms of the Emperor of Germany, and now appears on the arms of the sovereign of Austria, as heir to the German emperors.

KONRAD VON WÜRZBURG, one of the most celebrated poets of the middle ages, died at Basel in celebrated poets of the initiagination, learned, and— 1287. K. is fertile in imagination, learned, and— although marking the decline of medieval High-German poetry by his prolix and artificial style— probably the most perfect master of German versification that had appeared up to his own day. His last poem, which he left in an unfinished condition, has for its subject The Trojan War, and is printed he instituted the God's Truce (q, v). In 1026, he crossed the Alps chastised the rebellious Irahans, as a convenit at Milan as king of Italy, and he and a large true to the convenit and the same convenit at Milan as king of Italy, and he and a large true peems, of which the best Engeldand.

old and scarce impression). Next to this may be ranked his Otto mit dem Bart (reprinted by Hahn at Quedlinb. and Leip. 1838); Der Welt Lohn (hy Roth, Fkr. 1843); The Legends of Sylvester (by W. Grimm, Gött. 1841) and of Alexius (by Massmann, Quedlinh, and Leip. 1843); Die Goldene Schmiede (by W. Grimm, Berl. 1840). His songs and proverbs are to be found in Hagen's Minnesinger.

KONRADIN OF SWABIA, the last descend-ant of the imperial House of Hohenstanter (q. v.), was the son of Konrad IV., and was born in 1252, two years before his father's death. Innocent IV. immediately seized upon the young prince's Italian possessions, on the plea that the son of a prince who dies excommunicated has no hereditary rights; and the other enemies of the House of Hohenstaufen rejoiced to follow the pope's example. K. was not left, however, totally friendless. His uncle Manfred took up arms in his behalf, drove the pope from Naples and Sicily, and in order to consolidate his nephew's authority, declared himself king till the young prince came of age. The pope's inveterate hatred of the Hohenstaufens induced him to offer the crown of the Two Sicilies to Charles of Anjou, a consummate warrior and able politician. Charles immediately invaded Italy, met his antagonist in the plain of Grandella, where the defeat and death of Manfred, in 1266, gave him undisturbed possession of the kingdom. But the Neapolitans, detesting their new master, sent depa-ties to Bavaria to invite K., then in his 16th year, to come and assert his hereditary rights. K. accordingly made his appearance in Italy at the head of 10,000 men, and being joined by the Neapolitaos in large numbers, gained several victories over the French, but was finally defeated, and along with his relative, Frederick of Austria, taken prisoner near/Tagliacozzo, 22d August 1268. The two unfortunate princes were, with the consent of the pope, executed in the market-place of Naples on the 20th October. A few minutes before his execution, K., on the scaffold, took off his glove, and threw it into the midst of the crowd, as a gage of vengeance, requesting that it might be carried to his heir, Peter of Aragon. This duty was undertaken by the Chevalier de Waldburg, who, after many hair-breadth escapes, succeeded in fulfilling his prince's last command. See SICILIAN VESTERS.

Koudoo (Antilope strepsiceros).

koodon), one of the largest species of antelope. The and entire chapters or Surahs (from Hebr. shurwi,

(reprinted by Haupt at Leipsic in 1844, from an general form is not so light and elegant as that of many of the antelopes. The height is about four feet, and the length fully eight feet, exclusive of the tail, which is moderately long, and terminates in a tuft like that of an ox. The male is furnished with great horns, nearly four feet long, and beautifully twisten in a wide spiral of two turns and a half, very thick at the base, and there wrinkled and ringed. The female is smaller than the male, and hornless. general colour is gravish brown, with a narrow white stripe along the middle of the back, and eight or ten similar stripes proceeding from it down the sides. The K. lives in small families of four or tive, inhabiting chiefly the wooded parts of South Africa. It is easily domesticated, and is one of the animals which, probably, man has not yet done enough to

> KOO'MRAH (Equus hippagrus), an alleged distipet species of the family Equide, a pative of North Africa, and inhabiting mountain woods. It is ten or ten and a half hands high; with a broad deep head; no forelock, but long woolly hair down to the eyes; long black mane; tail more like that of a horse than of an ass; the colour a uniform reddish bay, without mark or streak. Colonel Hamilton Smith supposes that it may be the Boryes of Herodotus, and Hippagrus of Oppian.

> KOO'RIA MOO'RIA ISLANDS, a group of six islands, on the south coast of Arabia, are situated about 21 miles from the coast, about lat. 17° 33' N., and long. 56° 6' E. The surface of these islands is sterile, and the only one which is inhabited supports only from 20 to 30 fishermen. They were ceded to England in 1854. Guano of an inferior quality is obtained from them.

KO'PEK, a Russian money of account, the 100th part of a Rouble (q. v.), and equivalent to 11 farthings of sterling money.

KO'RAN (Arah., from karaa, to read), [= Hebr. Mikra, the written Book, or that which can and ought to be read :- the Old Testament, in contradistinction to Mishnah, or the Code of the Oral Law], The Reading, by way of eminence; a term first applied to every single portion of Mohammed's 'Revelations;' at a later period, used for a greater number of these; and finally for their whole body, gathered together into the one book, which forms the religious, social, civil, commercial, military, and legal code of Islam. The Koran is also known under the name of Forkan (Chald. Salvation, not from Hehr. Perek, Division, as erroneously supposed); further, of Al-Moshaf (The Volume), or Al-Kitab (The Book, in the sense of 'Bible'), or Al-Dhikr ('the Reminder,' or 'the Admonition'). The Koran is, according to the Moslem creed, coeval with God, uncreated, eternal. Its first transcript was written from the beginning in rays of light upon a gigantic tablet resting by the throne of the Almighty; and upon this tablet are also found the divine decrees relating to things past and future. A copy of it, in a book bound in white silk, jewels, and gold, was brought down to the lowest heaven by the angel Gabriel, in the blissful and mysterious night of Al-Khadr, in the month of Ramadan, Portions of it were during a space of twenty-three years, communicated to Mohammed, both at Mecca and Medina, either by Gabriel in human shape, 'with the sound of bells,' or through inspirations from the Holy Ghost 'in the Prophet's breast,' or by God himself, 'weiled and unveiled, in waking or in the dreams of night.' Traditions vary with respect to the length of the individual portions KOO'D'() (Antilope strepsiceros, or Strepsiceros revealed at a time, between single letters, verses,

The first revelation forms, in the present arrangement of the book, verses 1-5 of surah xevi., and begins with the words: 'Read [preach], in the name of thy Lord, who has created all things !

Mohammed dictated his inspirations to a scribe, not, indeed, in broken verses, but in finished chapters, and from this copy the followers of the Prophet procured other copies-unless they preferred learning the oracles by heart from the master's own mouth. The original fragments were, without any mouth. The original fragments were, winout any attempt at a chronological or other arrangement, promisciously thrown into a box, and a certain number were entirely lost. A year after the death of Mohammed, the scattered portions were, at the instance of Abu Bekr, collected by Zaid Ibn Thäbit of Medina, 'from date-leaves and tablets of white stone, bones, and parchment-leaves, and the breasts of men, and faithfully copied, without the slightest attempt at moulding them into shape or sequence, together with all the variants, the repetisequence, together with an tile variants, the repeat-tions, and the gaps. This volume was intrusted to the keeping of Hafsa, one of the Prophet's wives, the daughter of Omar. A second redaction was instituted in the thirtieth year of the Hedjrah, by Calif Othman, not for the sake of arranging and correcting the text, but in order to restore its unity : many different readings being current among the believers. He ordered new copies to be made from the original fragments, in which all the variants were to be expanged, without, however, any further alteration, such as the suppression of certain passages, &c., being introduced; and the old copies were all consigned to the flames. With respect to the succession of the single chapters-114 in numberno attempt was made at establishing continuity, but they were placed side by side according to their respective lengths; so that, immediately after the introductory fattah or exordium, follows the longest chapter, and the others are ranged after it in decreasing size. They are not numbered in the manuscripts, but bear distinctive, often strangemanuscripts, but bear distinctive, other strange-sounding headings, as: the Cow, Congealed Blood, the Fig. the Star, the Towers, Saba, the Poets, &c., taken from a particular matter or person treated of in the respective chapters. Every chapter or surah begins with the introductory formula: 'In the name of God, the Merciful, the Compassionate,' It is further stated at the beginning whether the surah was revealed at Mecca or at Medina. Every suran was revened at meeca or at Menma. Every chapter is subdivided into smaller portions (Ayath, Hebr. Oth, sign, letter), varying in the ancient 'seven editions' or primitive copies [of Melina (two), Meeca, Kufa, Basra, Syria, and the 'Vulgar Edition']—reduced by Nöldeke to four editions—between 6000 and 6036. The number of words in the whole book is 77,639, and an enumeration of the letters shews an amount of 323,015 of these. Other -encyclical-divisions of the book are : into thirty ajzā and into sixty ahzāb, for the use of devotional readings in and out of the mosque. Twenty-nine Surahs commence with certain letters of the alphabet, supposed to be of mystical purport

medanism will be considered under that head, while for questions more closely connected with authorship and chronology, we must refer to Mohammed. Briefly, it may be stated here, that the chief doctrine laid down in it is the unity of God, and the existence of but one true religion, with changethe existence of but one treatment related and the able ecremonies. When mankind turned from it at different times, God sent prophets to lead them back to truth: Moses, Christ, and Mohammed being the most distinguished. Both punishments for the

The contents of the Koran as the basis of Moham-

the Midrash. Special laws and directions, admonitions to moral and divine virtues, more particularly to a complete and unconditional resignation to God's will (see ISLAM), legends, principally relating to the patriarchs, and, almost without exception, borrowed from the Jewish writings (known to Mohammed by oral communication only, a circum-stance which accounts for their often odd confusion), form the bulk of the book, which throughout bears the most palpable traces of Jewish influence. Thus, of ideas and notions taken bodily, with their Arabicised designations, from Judaism, we may mention—Koran = Mikrah (Reading); Forkan (Salmention—Royal = August (Reading); For an ex-vation); the introductory formula, Bismillah (in the name of God); Torah (Book of Law); Gan Eden (Paradise); Gehinnom (Hell); Haber (Master); Darash (to search the Scriptures); Rabbi (Teacher); Sabhath (Day of Rest); Shechinah (Majesty of God); Mishnah (Repetition, or Oral Law), &c. The general tendency and aim of the Koran is found pretty clearly indicated in the beginning of the second chapter: 'This is the book in which there is no doubt; a guidance for the pious, who believe in the mysteries of faith, who perform their prayers, give alms from what we have bestowed upon them, who believe in the revelation which we made unto thee, which was sent down to the prophets before thee, and who believe in the future life, &c. To unite the three principal religious forms which he found in his time and country—viz. Judaism, Christianity, and Heathenism—into one, was Mohammadis, ideal and the Mora. was Mohammed's ideal, and the Koran, properly read, discloses constantly the alternate flatteries and threats aimed at each of the three parties. No less are certain abrogations on the part of the Prophet himself, of special passages in the Koran, due to the vacillating relation in which he at first stood to the different creeds, and the concessions first made, and then revoked. Witness the 'Kiblah,' or the place where the believer was to turn in his prayer, first being Jerusalem; fasting, being at first instituted in the ancient manner; forbearance to idolaters forming one of the original precents, &c.

The language of the Koran is of surpassing The language of the Koran is of surpassing elegance and purity, so much so, that it has become the ideal of Arabic classicality, and no human pen is supposed to be capable of producing anything similar :—a circumstance adduced by Mohammed himself as a clear proof of his mission. The style varies considerably; sometimes concise and bold, sublime and majestic, impassionate, fluent, and harmonious; it at other times becomes verbose, sententious, obscure, tame, and prosy; and on this difference modern investigators have endeavoured to form a chronological arrangement of the Koran, wherever other dates fail. But none of these attempts can ever he successful. Full manhood, approaching age, and declining vigour, are not things so easily traced in the writings of a man like Mohammed. The Koran is written in prose, yet the two or more links of which generally a sentence is composed, rhyme with each other, a peculiarity of speech used by the ancient south-sayers (Kuhhân = Cohen) of Arabia:—only that Mohammed used his own discretion in remodelling its form, and freeing it from conventional fetters; and thus the rhyme of the Koran became an entirely distinctive rhyme. Refrains are introduced in some surahs; and plays upon words are not disdained.

The outward reverence in which the Koran is held throughout Mohammedanism, is exceedingly great. It is never held below the girdle, never tack to "tittle" above, cursa, and commanded tong great. It is never near clow the groue, never the most distinguished. Both punishments for the touched without previous purification, and an injunction meanul rewards for the pious are depicted with tion to that effect is generally found on the cover great diffuseress, and exemplified chiefly by stories which overlaps the boards, according to Eastern taken from the Bible, the Apocryphal writings, and binding. It is consulted on weighty matters; sentences from it are inscribed on hanners, doors, &c. Great lavishness is also displayed upon the material and the binding of the sacred volume. The copies for the wealthy are sometimes written in gold, and the covers blaze with gold and precious stones. Nothing also is more hateful in the eyes of a Mosleyn than to see the book in the hands of an

unbeliever.

The Koran has been commented upon so often that the names of the commentators alone would fill volumes. Thus, the library of Tripoli, in Syria, is reported to have once contained no less than 20,000 different commentaries. The most renovmed are those of Samachshari (died 539 H.). Beidhavi (died 685 or 716 H.), Mahalli (died 870 H.), and Soyuti (died 911 H.). The principal editions are those of Hinkelmann (Hamburg, 1694). Maracci (Padua, 1698), Flügel (3d ed. 1838), besides many editions (of small critical value) printed in St Petersburg, Kasan, Teheran, Calcutta, Cawnpore, Serampore, and the many newly-erected Iodian presses. The first, but very imperfect, Latin version of the Koran was made by Robertus Retensis, an Englishman, in 1143 (ed. Basle, 1543). The principal translations are those of Marac'i, into Latin (1698); Sale (first ed. 1734) and Rodmito Latin (1999); Saie (urst ed. 1789) and tood-well (1862), into English; Savary (1783), Garein de Tassy (1829), Kasimirski (1840), into French; Megerlin (1772), Wahl (1828), Ullmann (1840), into German; besides the great number of Persian, Turkish, Malay, Hindustanee, and other transla-tions made for the benefit of the various eastern Moslems. Of concordances to the Koran may be mentioned that of Flügel (Leip. 1842), and the ties whose works may be consulted on the Koran, we will chiefly name Maracci, Sale, Savary, Wahl, Geiger, Amari, Sprenger, Muir, Weil, Nöldeke.

KORDOFA'N, or the White Land, a province of the Egyptian territories in the Sudan, is bounded on the E. by the White Nile, which separates it from Sennaar, and is separated on the W. from Darfur by a strip of desert. It extends in lat. from 10° to 15 20' N., and the area of its more or less cultivated portion has been estimated at 12,000 square miles, and its population at 500,000. The province is traversed by no rivers; wells, however, abound, water being found almost everywhere, at a comparatively small depth. In the argi laceous and productive; and here dourra and maize are grown. In the north and west, the ments of the people are chiefly agricultural. In reared, but in the north and west, the nomad transport of produce and merchandise. The chief which had formerly been general, and had formed an important branch of trad in K., was abolished

made a conquest of K., and about six years after, the Sultan of Darfur overran the province, and

were stored with the produce of Arabia, India, and Abyssinia. This period of prosperity, how-ever, was brought to a close by the invasion of K., in 1821, by an Egyptian army. Since then K. has remained a province of the Turkish empire, under the viceroy of Egypt.

KORNER, THEODOR, a patriotic German poet was born at Dresden, 23d September 1791, and after the publication of a collection of immature verses in 1810, betook himself to the university of Leipsic. Here the young author, who had no aptitude for serious and solid studies, was led into several irregularities, which occessitated his leaving the university. After a short residence in Berlin, he went to Vienna, and began to write for the stage. His Der Grune Domino (The Green Domino), Die Braut (The Bride), and Der Nachtwächter (The Night-watchman), are among the best German comedies. His two most important dramas, Zriny and Rosamunde, though destitute of that sagacity of thought and knowledge of mankind which are essential to the permaneut success of such works, are full of noble enthusiaam. The uprising of the German nation against the despotism of Napoleon, inspired K. with patriotic ardour. He joined the army of liberation, and displayed heroic courage in many encounters. The songs which he now wrote several of them in the camp-and published under the title of Leier und Schwert (Lyre and Sword), stirred his countrymen mightily. Their chief power, however, probably lies in their impassioned nationality; foreigners at least fail to recognise in them much more, yet the Germans regard them with a kind of sacred admiration that forbids eriticism. The most famous of these pieces is his Schwert-Lied (Sword-Song). K. was killed in battle near Rosenberg, 26th August 1813. A collected edition of his works (Sammtliche Werke, 1 vol. Berl. 1834 : 4 vols. 1842, 4th edit. 1853) was published by Streekfuss. A biography of the poet, written by his father, has been translated into English, with selections from his poems, tales, and dramas,' by G. F. Richardson (Lond. 2 vols. 1845).

KÖRÖ'S, NAGY, or GREAT KÖRÖS, an important market-town of Hungary, in the county of Pesth. is situated in a sandy district, 49 miles south-east of the city of that name. Black cattle and sheep are here extensively reared, and an excellent red wine is grown. Pop. 16,100.—Kiss Könös, or Little Körös, is a small town, situated 38 miles south-west of the foregoing, and also engaged in the production of wine. Pop. 6000.

KOSCIUSKO, TADEUSZ, a great Polish general and patriot, born about the middle of last century, and parrow, form anont the middle of last century, in the province of Minsk, Western Russia, was descended from an ancient and noble, but not wealthy Lithuanian family. He became a captain in the Forisi army, went to America, and serven the War of Independence. He returned to Poland in 1786, with the rank of general of brigade, lu the eampaign of 1792, he held a position at Dubjenka for tive days with 4000 men against 16,000 Russians, although he had had only twentyof arms laid the foundation of his military reputation. When King Stanislaus submitted to the will of the Empress Catharine, K. resigned his command, and retired to Lepsic; but returned in 1794, and put himself at the head of the national With 20,000 regular troops, and 40,000 ill armed and Prussian army of 150,000 men. He was proof also against the most tempting proposals on the

part of the Prussian king. He was at last overpowered by superior numbers in the battle of Maciejowice, 10th October 1794, and fell from his horse, covered with wounds, and uttering the words 'Finis Poloniæ.' He was kept a prisoner till after the accession of the Emperor Paul, who restored him to liberty, gave him an estate with 1500 peasants, and handed to him his sword, which K. declined to receive, saying: 'I have no more need of a sword, as I have no longer a country.' He afterwards resigned the estate, and sent back from London the money which he had received from the emperor. He spent the remainder of his life chiefly in France, and his chief enjoyment was in agricultural pursuits. When Napoleon, in 1806, formed a plan for the restoration of Poland, K. felt himself restrained from taking an active part in it by his promise to the Emperor Paul. The address to the Poles, published in his name in the Moniteur, was a fabrication. In 1814, he wrote to the Emperor Alexander, entreating him to grant an amnesty to the Poles in foreign countries, and to make himself constitutional king of Poland. He released from servitude. in 1817, the peasants on his own estate in Poland. His death took place on 15th October 1817, in consequence of his horse falling over a precipice. His remains were removed to Cracow by the Emperor Alexander, and were laid side by side with those of John Sobieski. See Falkenstein's K. nach seinen häuslichen und öffentlichen Leben (2d edit. Leip. 1834).

KÖSLI'N, a manufacturing town of Prussia, in the province of Pomerania, on the Mühlenbach, 7 miles from the Baltic Sea, and 83 miles north-east from Stettim. There are iron-foundries, and manufactures of tobacco, paper, &c. Pop. 10.059.

KOSSUTH, Lajos (Louis), the leader of the Hungarian revolution, was born in 1802 at Monok, in the county of Zemplin, in Hungary. His family is of noble rank, but his parents were poor. He studied law at the Protestant college of Sarospatak. and practised first in his native county, and afterwards in Pesth. In 1832, he commenced his political career at the diet of Presburg as editor of a liberal paper, which, owing to the state of the law, was not printed, but transcribed and circulated. The subsequent publication of a lithographed paper led, in May 1837, to K.'s imprisonment. He was liberated in 1840, and became again the editor of a paper, in which he advocated views too extreme for many of the liberal party amongst the nobles, but which took strong hold of the people in general, especially of the youth of the country. In November 1347, he was sent by the county of Pesth as depray to the diet, and soon distinguished himself as a steaker, and became the leader of the opposition. He advocated the emancipation of the peasants. the elevation of the citizen class, the freedom of the press, &c., and after the French revolution of 1848, openly demanded an independent government for Hungary, and constitutional government in the Austrian hereditary territories. To his speeches must in great part be ascribed not only the Hungarian revolution, b. t the insurrection in Vienna in March 1848. On the dissolution of the ministry in September 1848, he found himself at the head of the Committee of National Defence, and now prosecuted with extraordinary energy the measures necescuted with extraordinary energy the measures neces-sary for carrying on the war. To put an end to all the hopes and schemes of the moderate party, he induced the National Assembly at Debreczin, in April 1849, to declare the independence of Hungary, and that the Hapsburg dynasty had forfeited the

the intervention of the Western Powers, and finding the national cause jeopardised by the arrival of Russia on the scene of action, he endeavoured to arouse the people to a more desperate effort. The arouse the people to a more useperate error. And attempt was vain. Finding that the dissensions between himself and Görgei (q. v.) were damaging the national cause, he resigned his dictatorship in favour of the latter. After the defeat at Temesvar on 9th August 1849, he found himself compelled to abandon his position, and to flee into Turkey, where, however, he was made a prisoner; but though his extradition was demanded both by Austria and Russia, the Porte, true to the principle of hospitality, resisted all their demands. In September 1851 he was liberated, and the government of France refusing him a passage through their territory, he sailed in an American frigate to England, where he was received with every demonstration of public respect. In December of the same year he lauded in the United States, where he met with an enthusiastic reception. He returned in June, 1852, to England, and there he chiefly resided, until the Italian war broke out against Anstria, when almost the whole of the Hangarian emigrants left for Italy with Kossuth. In August, 1867, he was elected a deputy to the Hangarian Parliament, but resigned in April, 1868.

KOSTRO'MA, capital of the government of that name, in European Russia, is situated man that name, in European Russia, is situated man that nulles from SF Petersburg, I she by Voga, all in the middle of the 12th c, and suffered much from the invasions, first of the Tartars, afterwards of the Poles. K has considerable manufactures, chiefly of lines, and trades in corn, tallow, timber, linseed oil,

and leather. Pop. 1863, 21,415.

KOSTROMA, a government of Great Russia, is bounded on the W, by the government of Jaroslav, and on the E, by the district of Kazam. Avag. 30,834 square miles; pop. (1684) 1,073,971. The surface is generally flat, marshy, interspersed with lakes, and, especially in the north and east, with extensive and dense forests. The greater part of the soil is uncultivated. The chief rivers are the Volça, with its tributaries the Kostroma, the Uniqa, and the Vetluga. The climate is severe. Agriculture is the principal occupation of the inhabitants, and grain is produced in sufficient quantity for local consumption. Flax and hemp are extensively cultivated; mats, pitch, tar, and potash are largely manufactured and exported; and there is a flourishing travel in timber.

KOTAH, the chief town of a protected state of the same name, is situated in Rajpootana, in lat. 28 10 N., and long, 73 52 E. It is on the right bank of the Chumbul, and is fortified with a rampart and a ditch. The town is tolerably wealthy, being, moreover, of considerable size, and of some architectural pretensions. In 1837, notwithstanding the fidelity of the rajah to the British government, K. Ell under the power of the mutineers, remaining K. Ell under the power of the mutineers, remaining was stormed by General Roberts. The principality contains 4400 square miles, with an estimated population of 440,000.

in March 1848. On the dissolution of the minisary in September 1848, he found himself at the head of the Committee of National Defence, and now prosecuted with extraordinary energy the measures necessary for carrying on the war. To put an end to all the hopes and schemes of the molerate party, he have a season and schemes of the molerate party, he have a season and cermanty, was assassinated at Mannheim, 234 the hopes and schemes of the molerate party, he have a season and cermanty, was assassinated at Mannheim, 234 and the hopes and schemes of the molerate party, he have been season and the season of the season and the season of the seas

the latter, under the title of The Stranger, being well known on the English boards-Die beiden Klingsberg (The Two Klingsbergs), Die Spanier in K. wrote no fewer than ninety-eight dramas, which have been collected in editions of 28 (Leip. 1797-1823) and of 44 vols. (1827 - 1829), Several of them have been translated into English.

KOU'BA, a town in the south of Russia, on the eastern slope of the Caucasus, in the government of Derbend, 55 miles south-south-east of the town of that name, lat. 41° 22' N., long. 48° 31' E. Agriculture, fishing, the rearing of silkworms, and trade with Astrakhan and Persia, chiefly employ the inhabitants. Pop. 9405. It was annexed to Russia in 1806.

KOUBA'N, a river in the south of Russia, rises on the declivity of Mount Elburz, and flows tirst north, then west, separating the governments of Stavropol and the Cossacks of the Black Sea from Circassia. It is about 400 miles in length, exclusive of its windings, and it falls partly into the Black Sea, partly into the Sea of Azof.

KOUSNE'TZK, a town of Russia, on the northern border of the government of Saratov, 110 miles north-north-east of the town of that name. Pon. 13,107, who are employed chiefly in bee-keeping and in woollen manufactures.

KO'VNO, capital of the government of the same name, in European Russia, near the confluence of the Vilia and the Niemen, was founded in the 10th c., and was the scene of many bloody conflicts between the Tentonic Knights and the Poles during the 14th and 15th centuries. Its commerce, not-withstanding its advantages of situation—being but also on the great railway from St Petersburg to Berlin-is very insignificant. Pop. (1866) 32,774.

KOVNO, a government of West Russia, lies immediately south of the province of Courland, and is bounded on the south-west by Prussia and Pohand. Area, 16,115 square miles, not more than onethird of which is cultivated, and about one-third under wood. Flax and honey are important products. Pop. (1864) 1,052,164. The surface is flat and marshy, and there are numerous lakes. The chief rivers are the Niemen, with its tributaries the Vilia, Neveja, and Doubissa. Plica Polonica (q. v.) is common among the peasantry. Previously to 1843, this government formed a part of that of Wilna.

KOZEI'LSK, a district town of Great Russia. in the government of Kalouga, and 40 miles southwest of the town of that name, stands on the right bank of the river Jisdra. Pop. 7420. It carries on a great trade in hemp, and an extensive manufacture of sailcloth. K. is famous in history for the brave but unsuccessful resistance made here to Batu-Khan of Kiptehak.

KOZLO'F, a town of Russia, in the govern-Voronetz, in lat. 52° 53° N., long. 40° 31° E. It was founded by the Czar Michael Fedorovitch as a stronghold against the Tartars. It is a flourishing town, has numerous woollen, linen, and other factories, and a pop. of 28,613, who are employed largely in agriculture, and in horse and sheep breeding.

KRAJO'VA, a town of Wallachia, in Little Wallachia, near the eastern bank of the Schyl, 120 miles west of Bucharest. It is the residence of many rich hojars (nobles), carries on considerable commerce, and has a pop. of 21,500.

KRA'KEN, a fabulous animal, first described by Pontoppidan in his Natural History of Norway, and from time to time said to have been seen in the Norwegian seas. Euormous magnitude is ascribed

to it; it is said to rise from the sea like an island, to stretch out mast-like arms, by which ships are readily drawn down, and, when it sinks again into the deep, to cause a whirlpool, in which large vessels are involved to their destruction. The fable of the K, has considerable analogy to the more recent stories of the Great Sea Serpent (q. v.). It is not, however, to be summarily rejected as mere unmingled fable. There may, perhaps, be some foundation for it in the occasional appearance of huge cephalopeds, to the general characters of which the description given of its form and monstrous arms sufficiently agrees, great exaggeration as to size being of course allowed for. Large as are some of the cephalopods known to exist in some seas, there are reasons for supposing that creatures of this kind do exist much larger than any that have been accurately described; and stories, similar to the Norwegian ones recorded by Pentoppidan and others, are current in different parts of the world. Such is the story told by Pliny concerning a vast animal with prodigious arms which impeded the navigation of the Strait of Gibraltar. Chambers's Edinburgh Journal, first series, xi. 226.

KRAMERIA. See RATTANY ROOT.

KRASNOIA'RSK, chief town of the Siberian government of Yeniseisk, is situated on the great road from Europe to East Siberia, at a distance of 3197 miles from St Petersburg. It contains 7628 inhabitants, chiefly Cossacks, some of whom possess numerous herds of eattle and horses. There is a considerable trade in furs, and there are about thirty tan-yards and other factories.

KRAZINSKI, COUNT VALERIAN, a scion of an illustrious Polish family that had early adopted the Protestant religion, was born about 1780. Being possessed of great natural abilities, which were improved and matured by a thorough education, he was appointed one of the chief officials in the bureau of Public Instruction for Poland. He strenuously exerted himself to promote education among the various classes of dissenters, and, with a view to this, introduced, at great expense to himself, the process of stereotyping. When the Poles rebelled in 1830, and set up an independent government, K. was sent as their representative to London, where, from 1831, he remained as an exile for twenty years, and then removed to Edinburgh. where he died, 22d December 1855. Being a man of extensive learning, and possessing a profound knowledge of the history and literature of the Slavonic nations, his works are of considerable authority. The chief are—The Rise, Progress, and Decline of the Reformation in Poland (Lond. 2 vols, 1839-1840), Lectures on the Religious History of the Slavonic Nations (Lond. 1849), Montenegro and the Slavonians in Turkey (Edin. 1853), together with some translations, religious works, and political pamphlets on the subject of Poland.

KREASOTE. See CREASOTE.

KREATINE. Sec CREATINE.

KRE'FELD, an important manufacturing town Rhenish Prussia, twelve miles north-west of Düsseldorf. It owes its importance to the settlement here, in the 17th and 18th centuries, of numerous refugees, who were driven from the neighbouring countries by religious persecution, and who established here the silk and velvet manufactures for which K. is now the most noted town in Prussia, The town itself and the immediate vicioity employ upwards of 20,000 hands in these manufactures, and the value of the goods produced annually is estimated at upwards of a million sterling. K. also carries on manufactures of woollen cloth and yarn, cotton goods, machinery, and chemicals. Pop. (1867) 53,821.

KREMENCHU'G, a district town of Little Russia, in the government of Poltava, on the left bank of the Dnieper, ninety miles above Ekater-inoslav. It was founded in the 16th c. by Sigis-nundus-Augustus, king of Poland, as a barrier against the Tartars. During the reign of Catharine II., it was the chief town of New Russia, and it is now the seat of great industrial and commercial enterprise, containing 34 factories, chiefly for melting tallow and for rope-making. Pop. (1863) 25,848.

KREMENETZ, a district town of West Russia, in the government of Volyn (Volhynia), is situated 130 miles west of Jitomir, and about 20 miles from the frontier of Austrian Galicia. It has 10,486 inhabitants, and seven annual fairs are held here, but, owing to the want of river-communication, the commerce is limited.

KRE'MNITZ, a town of Hungary, in the county of Bars, in a deep gloomy valley, twelve miles west-south-west of Neusohl. It is famous for its gold and silver mines, which, however, are less productive now than formerly. Pop. 6339. It is supplied with water by an aqueduct 50 miles in length,

KREMS, a town of Lower Austria, in a picturesque district on the Danube, at the confinence of the Krems with that river, 38 miles west-north-west Vienna. It manufactures mustard and powder, and trades in wine. Pop. 5300.

KREU'ZER-from the cross (kreuz) formerly conspicuous upon it-a small copper coin current in Southern Germany, the 60th part of the gulden or Florin (q. v.).

KREU'ZNACH, a town in the province of Rhenish Prussia, on the Nahe, a few miles from its junction with the Rhine, and 38 miles south-southeast of Coblentz. It has crooked narrow streets, old-fashioned houses, and about 10,000 inhabitants. It dates its existence from about the 9th century. It is chiefly notable, however, for its salt springs, which were discovered in 1478, and which, containing iodine and bromine, are serviceable in many diseases. It is therefore much frequented. The springs are of various temperatures, from 45½° to 84° F.

KRIMMITSCHAU, a town of Saxony, about 37 miles south of Lepsic, on the railway between that place and Hol. It is a busy manufacturing town, the industrial products being woollen yarn, woollen and cotton fabries, buttons, needles, &c. Pop. 9576.

KRI'SHNA, the eighth Avatâra or incarnation of the Hindu god Vishnu. See Vishnu.

KROLOWE'Z, a town of Little Russia, in the government of Tehernigov, is situated 100 miles east of the town of that name. A famous annual market is held here. Pop. upwards of 6000.

KRO'SSEN, a walled town of Prussia, on the left bank of the Oder, 32 miles south-east of Frankfurt. There are manufactures of woollen, linen, leather, and earthenware. Pop. 7000.

KRÜDENER, JULIANA VON, a religious visionary and enthusiast, daughter of Baron von Vietinghoff, was born at Riga in 1766. When she was but 14, she married the Baron von Krüdener, a Livonian nobleman, who held the post of Russian ambassador Her married life, however, was unhappy, at Venice. and after the birth of a son and daughter, she was divorced from her husband. The succeeding incidents of her stormy career are supposed to form the groundwork of the novel of Valerie, which she published in 1803. After many adventures, M. von K. Tsou), more properly Khûbilai Khan, the Khagan,

came to Berlin, where she was admitted to the close intimacy of the queen, Louisa, of all whose projects M. von K. was the confidente and sharer. The shock occasioned by the death of this princess is said to have disturbed the balance of M. von K.'s mind: and from that date she became a zealons disciple of the celebrated pietist, Jung Stilling, and ultimately gave herself up to religious mysticism in its most exaggerated form. From Berlin she moved to Paris, exaggerated form. From Berlin she moved to Faris, where she appeared as a prophetess, and the herald of a new religious era; and she attracted such notice by the fulfilment of certain of her predictions of public events, as of the fall of Napoleon, his return from Elba, and the final crisis of Waterloo, as to obtain access to the Emperor Alexander, and eventually to acquire much influence over him. Her gigantic schemes for the elevation of the social and moral condition of the world, caused her to appear a dangerous character in the eyes of persons in anthority, and she was obliged to withdraw from France and other countries in succession. In consequence, she retired to one of her paternal estates near Riga, where she entered into relations with the Herrnhüter or Moravian Brethren; but her restless disposition soon carried her into fresh enterprises, the latest of which was the formation of a great correctional establishment in the Crimea for the reformation of criminals and persons of evil life. In the midst of her efforts for this object, she died In the most of her enorts for this opject, she dual tarta-su-bazar, December 13, 1824. Besides the novel already named, her only other work was a pamphlet entitled Le Camp des Vertus (Paris, 1815); but many curious details of her conversation and opinions are preserved in Krug's Conversations with Madame von Krüdener, published at Leipsic in 1818.

KRU'MAU, a small town of Bohemia, on the Moldau, 14 miles south-south-west of Budweis. Its castle, a fine structure placed on a reck, contains five separate courts, and is surmounted by numerous towers and pinnaeles. There is some manufacturing industry. Pop. 6600.

KRUMMACHER, FRIEDRICH WILHELM, the son of F. A. Krummacher, a elergyman who dis-tinguished himself by his zeal for old Lutheranism, and also as an opponent of the Rationalists, Some of his works, particularly his discourses on the history of Elijah the Tishbite, have not only acquired a great popularity in Germany, but, by means of translations in Britain and America. He gave great offense by his demonciation of the Rationalists, and as preacher of a reformed community went to New York in 1843. He settled in Berlin in 1847, and held the office of chaplain to the Prussian court at Potsdam. K, was regarded as one of the most eloquent preachers in Germany. He was born in 1796, and died in

KRU'MMHORN (Ital. cormorne) is the name of a very old wind-instrument made of wood, the under part of which is bent outwards in a circular are,-Krummhorn is also the name of an organ-stop, Krummhorn is also the name of an organ-stop, found in almost all German organs, and generally of eight feet pitch. The pipes are made of tin, the body or sounding part being cylindrical, and partly shut at the upper end. The Italian name of commone has been corrupted by English organ-bailders into cremona, which is the same stop in English organ-lish organs. The sound of the krummhorn as an organ-stop is soft and quiet; but it is defective in not keeping in tune so well as other reed-stops.

KSHATRIYA, the second or military caste in the social system of the Brahmanical Hindus. See CASTE.

KÛBLAI KHAN (called by the Chinese CHI-

or Grard Khan of the Mongols, and Emperor of China, was the grandson of Genghis Khan through his fourth son, Tuly Khan. Being ordered by his brother Mango, then Khagan of the Mongols, to subjugate the Corea and China, K., availing himself of an application made by Si-Tsong of the Song to aid him in expelling the Mantchûs, entered China (1260) with an immense army, drove out these Tartars (or Kin dynasty), and took possession of North China. K., who was an able and energetic prince, adopted the Chinese mode of civilisation, and endeared himself to his subjects by his attention to men of letters, and the honours which he bestowed on the memory of their former renowned monarchs. In 1279, he completed the ruin of the Song dynasty by invading and subduing Southern China, and founding a new dynasty-that of the Yuen (the first foreign race of kings that ever ruled in China). From 1259, K. had been the Khagan of the Mongols, so that his dominions now extended from the Frozen Ocean to the Strait of Malacca, and from the Corea to Asia Minor-an extent of territory the like of which had never before, and has never since, been governed by any one monarch. He was also the last grand khan whose right of suzer-ainty was recognised over all the countries conquered by the Mongol arms. His court was attended by the learned men of India, Persia, Transoxiana, and some even from Europe, among whom is found the celebrated Marco Polo. Towards the close of his life, he sent an expedition against Japan, but it totally failed. Irritated by this disaster, he indem-nified himself by the conquest of Mantehuria and other neighbouring districts; but soon after died at Pekin in 1294. The grand dukes of Russia were among his tributaries.

KUENLU'N, the name of a mountain-range in Central Asia. See TURKESTAN.

KU'FIC COINS is the name of the carliest Mohammedan coins, inscribed with the Kufic or ancient Arabic character (see the following article). According to Makrizi, the first were struck in the 18th year of the Hedjrah (638 A.D.), under Calif Omar, who, wishing to make Islam entirely independent of foreign, chiefly Byzantine and Persian, influence, even in the province of money, caused 'Mohammedan' coins to be struck, in the shape of those Persian and Byzantine ones which had been circulating among his subjects till then, and he caused them to be inscribed with Koranic passages. According to other Arabic writers, however (Al-Makin, Soyuti, 1hn Koteiba, &c.), the earliest Kufic money dates from the time of Calif Alal Al-Malek (76 H. = 695 A. D.), a period much more probable, considering that no Kufic coins have hitherto been discovered anterior to 77 H. They were first of gold and silver, the former being dinars (corrupted from denarius-a name, moreover, wrongly applied), of the value of about 10s. 8d.; the latter, dirhems (drachma), worth about 54d. Not before 116 H. were copper coins, fels (follis? obolus?), introduced, and the material for them was taken by the order of Calif Walld from a colossal bronze statue of an idol. Figures, human or otherwise, are rarely met with on these coins. The legend generally runs either around the margin, or is enclosed by a ring. The oldest dinar—of 77 H.—is preserved in the Milan Museum (formerly Cav. Millingen's collection). of 79 H. The oldest dirhem found as yet, dated 82 H., is likewise in Milan, in the Museo di Stefano di Mainons. One of the richest collections of Kutic coins is in the Stockholm Academy: owing chiefly to the great numbers found on the shores of the Baltic, brought thither probably by Mohammedan traders

in the middle ages. Not before the 7th c. H. were the Kufic characters superseded by the modern Neshki, upon coins; while far books, &c., they had long fallen into dissue. The best authorities on this subject are Makraž, Adler, the Tyelsens, Reiske, De Sacy. Castilioni, Cataneo, Frahn, Lindberg, Pictrazzewski.

KUFIC WRITING, an ancient form of Arabio characters, which came into use shortly before Mohammed, and was chiefly current among the Monammed, and was enemy current among the inhabitants of Northern Arabia, while those of the south-western parts employed the Himjaritic or Mosnad (clipped) character. The Kufic is taken from the old Syriac character (Estrangelo), and is said to have been first introduced by Moramer or Morar ben Morra of Anbar. The first copies of the Koran were written in it, and Kufa, a city in Irak-Arabi (Pashalic of Bagdad), being the one which contained the most expert and numerous copyists. the writing itself was called after it. The alphabet was arranged like the Hebrew and Syriac (whence its designation, ABGaD HeVeS), and this order, although now superseded by another, is still used for numerical purposes. The Kufic character, of a somewhat clumsy and ungainly shape, began to fall into disuse after about 1000 A.D.: Ebn Morla of Bagdad (d. 938 A.D.) having invented the current or so-called Neshki (nashak, to copy) character, which was still further improved by Ebn Bawwah (d. 1031), and which now-deservedly, as one of the prettiest and easiest-reigns supreme in East and West. It is only in MSS, of the Koran, and in title-pages, that the Kufic is still employed. A peculiar kind of the Kufic is the so-called Karmatian-of a somewhat more slender shape-in which several inscriptions have been met with both in Arabia, and in Dauphiny, Sicily, &c., and which is also found on a coronation-mantle preserved in Nuremberg. The Kutic is written with a style, while for the Neshki, slit reeds are employed. Different kinds of the latter character (in which the alphabet is arranged according to the outward simi-larity of the letters) are the Moresque or Maghreb (Western), the Diváni (Royal-only employed for decrees, &c.), the Talik (chiefly used in Persian), the Thsoletki (threefold or very large character), Jakuthi, Riháni, &c.

KUGLER, Franz Theodor, a German historian of art, was born at Stettin, January 19, 1808, and studied at the university of Berlin. After the completion of a very diversified course of study, he devoted himself to the study of the fine arts. In 1833, he became a professor in Berlin, when he died, March 16, 1858. His most valuable works as a Hambourh der Gebiedte der Meierie, des alle and the study of the study of the study of the control of the study of the

KUH-HORN, sometimes called Alphorn, is a wind-instrument much used by the herbenen in the mountainous countries of Germany. It cansists of a tabe about three lees long, and a little book may be about three lees long, and a little book may be about three lees long, and a little book may be about three lees long, and a little book may be about the lees long, and a little book may be about the book may be about the book may be about the willow, wrought together, and bound by a pitched cord. The sound of the kul-horn is preduced by a month-piece like that of a trombione. It has generally only five notes, but extending over nearly

two octaves—viz., C, G, C, E, G. With these five melodies, which, among the mountains, have an notes, the herdsmen often play most interesting indescribable charm. The following is a specimen:

KU'ILENBURG. See CULENBORG.

KUKAWA, an important town of Central Africa, capital of Bornu, is situated in a level district on capital of Bornu, is situated in a level district on the western shore of Lake Tsad, in lat. 12° 55' N., and long. 13° 26' W. It consists of two dis-tinct towas, each surrounded by its own wall, and separated by a space of about half a mile. A great fair or market is held here weekly. The principal articles offered for sale are corn, dried fish, oxen, horses, camels, slaves, cloth, beads, earthenware. Upwards of 100 camels are sometimes sold here in one day. From 12,000 to 15,000 people are often crowded together in the market-place.

KU'LA, a town of Austria, in the Servian Woi-wodschaft, on the Franzens or Bacs Caual, 26 miles north-west of Neusatz. Pop. 7000.

U'LDJA, also called ILI, or EELEE, an important town in the Chinese frontier territory of Djungaria, in lat. 43° 55′ N., and in long. 80° 58′ E., on the right bank of the Ili, a considerable river, which, rising in the Tian-Shan Mountains, flows westward into Lake Balkhash, after a course of about 300 miles. A large market is held at K., and it is the residence of a dignitary called the Kee Roy, or Tsian-Tiung. Pop. 70,000.

KULM, a small village of Bohemia, 16 miles north-north-west of Leitmeritz, was the scene of two bloody conflicts between the French and allies on the 29th and 30th August 1813. The French, numbering 30,000 men, were commanded by General Yandamme; the Russians, during the first day's conflict, were 17,000, and were commanded by General Ostermaon-Tolstoi. During the night, the treneral visconian roise. During the light, the second day Barclay de Tolly assumed the complete wreck of the French army, which lost in these two days little short of 20,000 men, while the allies did not lose half of that number.

KUMAO'N, including Eastern Gurhwal, is a British territory within the North-west Provinces of India, in lat. 29"-31° N., and long. 78"-91 E. It lies chiefly on the south slope of the Himalaya, comprising upwards of thirty summits in that range, which vary in altitude from about 18,000 feet to nearly 26,000. With the exception of a belt on its southern frontier, which is from 2 miles to 15 miles broad, the whole country is one mass of mountains and forests. It contains mines of gold, copper, and lead, which, however, have never yet been profitably worked. Throughout the southern belt above mentioned, it produces, generally in two crops a year, wheat, barley, oats, millet, pease, beans, &c., year, wheat, barrey, oats, maret, pease, beans, ec, with rice, cotton, indigo, sugar, ginger, turneric, &c. More lately, too, K. has become the rival in India of Assam for the cultivation of the tea-plant. The climate is unhealthy. The area is about 7000 square miles, and the population about 170,000. The principal towns are Almorah, Mandi, and Kasipoor.

KUMARASAMBHAVA is the name of one of the most celebrated poems of the Hindus. Its reputed author is Kālidāsa (see Kālidāsa), and its subject is the legendary history connected with the birth of Kumara, or Karttikeya, the Hindu god of war. See KARTTIKEYA. It consists of 22 cantos, strata which make up the Permian rocks. It

but only 8 have hitherto been published in the original Sanscrit. The first 7 have been elegantly rendered in English verse by Mr R. T. H. Griffith, at present Principal of the Benares Government College.

KUMBU'K (Pentaptera tomentosa), a tree of the natural order Combretaceæ, a native of the East Indies. It is a noble tree, and produces durable timber. Sir James E. Tennent describes a K. tree in Ceylon, 45 feet in circumference close to the ground, and 21 feet at 12 feet above the ground, which serves as a landmark for boatmen, towering high above forests of cocoa-palm, and discernible at a distance of 20 miles. The bark of the K. vields a black dye, and contains so much lime, that its ashes are commonly used as lime for chewing with betel.

KU'MISS, an intoxicating beverage much esteemed by the Kalmucks. It is made from the soured and fermented milk of mares. It has an acidulous taste. A spirit is obtained from it by distillation

KÜMMEL. See LIQUEUR.

KUMQUAT (Citrus Japonica), a small species of orange, a native of China and Japan, and much cultivated in these countries. It has been introduced into Australia. It endures more frost than any other of the genus, and will probably prove a valuable acquisition to many parts of Europe and America. The plant is a shrub sometimes six feet high, but in cultivation it is not allowed to exceed the height of a gooseberry-bush. The fruit is oval, the height of a gooseberry-bush. The fruit is oval, and about the size of a large gooseberry; the rind is sweet, and the juice acid. It is very delicious and refreshing. The Chinese make an excellent sweetmeat by preserving it in sugar.

KU'NERSDORF, a village of Brandenburg, in Prussia, nearly ten miles north-east of Frankfurton-the-Oder, was the scene of one of the most remarkable battles of the Seven Years' War, fought on the 12th August 1759, in which Frederick the Great was completely defeated by a combined attack of Russians under Soltikof, and Austrians under Laudon. The loss on the Prussian side was 26,000 men, with almost all their artillery and baggage, while their opponents lost 24,000 men.

KUNGU'R, a town in the south of the government of Perm, European Russia, and 1416 miles from St Petersburg, is renowned for its tanneries, in which the best quality of Russia leather is produced. In the neighbouring district are several large ironworks. Pop. (1859) 8298.

KUNIGU'NDÉ, St, wife of the Emperor Henry II., was the daughter of Count Siegfried of Luxemburg. Her husband, Duke Henry of Bavaria, was crowned king of the Germans in 1002, and emperor in 1014. Her reputation having been unjustly assailed, she vindicated herself by walking bare-footed over hot ploughshares. After the death of her husband in 1024, she retired into the convent of Kaufungen, near Cassel, which she had founded, spent the remainder of her days in pious works, and died on 3d March 1040. Pope Innocent IIL gave her a place amongst the saints in 1200.

KUPFERSCHIEFER, one of the series of

consists of beds of dark shale with copper ore (hence the name), and containing beautifully preserved fish, of species nearly allied to those of the Coal Measures.

KU'RA, or KUR (anc. Cyrus), the principal river of the Cancaus, rises in the Sahami chain, and after a south-eastern course of 535 miles, falls into the Caspian Sea by several shallow channels, about 60 miles north of the Persian boundary. Its chief tributaries are the Aras (anc. Arazen, the Alazan, and the Yora. The K. has so rapid a copres, and changes its channel so frequently, that

to bridge it is almost impossible. KURDISTA'N (' the Country of the Kurds '), an extensive region of Western Asia, running northwest and south-east, between lat. 34°-40° N. and long. 36°-48° E., bounded on the N.E. side by Armenia, Azerbijan, and Irak-Ajemi, and on the S.W. by the Tigris and Aljezira, belongs to the Turkish and Persian monarchies, chiefly to the former, and contains about 100,000 square miles, with a population amounting, according to Chesney's estimate, to 3,000,000—doubtless a very great exaggeration, though we have no means of disproving it. The country, with the exception of the tract bordering on the Tigris, is very monntainous, some of the peaks being nearly 13,000 feet the surface of the country into fertile valleys and extensive table-lands. The southern part is for the most part low and flat, parched in summer, and verdant during the wet season. The country is traversed by the Euphrates, Tigris, Zab-Ala, Zab-Asfal, and Divala or Shirvan, and contains several lakes, the chief of which are Van and Urumiah, Four-fifths of the inhabitants are Kurds (and Four-hiths of the inhabitants are Kurds (auc. Carduchi and Gordynei), a race partly uomad and partly agricultural, who occupy themselves chiefly, however, with the breeding of cattle, sheep, goats, and Persia, especially in horses, the Kurdish breed being so famed for its spirit and endurance, as to tion consists of Kurds, Turks, and Persians, who are engaged in agricultural employments. A remarkable product of this country is a substance found on the leaves of the tamarisk and other shrubs, 'manna' in the Old Testament, and is supposed to result, like oak-galls, from the puncture of the leaf by an insect. The country is deficient in mineral wealth. The inhabitants, with the exception of the Nestorians (q. v.), who inhabit the valley of the Tigris, profess a debased form of Mohammedanism. The chief towns in Turkish K. are Bitlis (q. v.), Van, Urumia, Mardin (ane. Mardein), Mush. Korkuk, Diarbekir, Malatia, and Marash. The Persian porincluded in Azerbijan, Ardelan, and Irak-Ajemi.

KU IRILE ISLANDS, a line of islands in the North Pacific Ocean, extend between the south extremity of Kamtchatka and the Japanese island of Yesso. They are under the government of the Russo-American Company, and are 22 in number, 19 of them belonging to Russia. Area of the islands possessed by Russia, 3843 square mules; popbetween 200 and 300. Triline is paid in furs' and sen-calves. The K. I. are all volemic. The vegetation is poor; the principal productions being the furs' of foxes, wolves, seals, and beavers. Navigation near the islands is difficult.

KURISCHES HAFF, an extensive lagoon, separated from the Baltic Sea by a ridge of sand from one to two miles is width. It extends nearly sixty

miles along the coast of East Prussia from Labian to Menuel, where it enters the Baltic by the 'Memel Deeps,' a channel about 1000 feet wide, and 12 feet deep. Its greatest breadth at the southern extremity is about 28 miles, but its average breadth is not above 14 miles. The waters of the K. H. are fresh. Its depth is very variable, and hence the control of the land is called the 'Kuruche Neerung,' and has a few villages upon it.

KURNUL, the chief town of a district of the same name, in the presidency of Madras, in lat. 15° 50′N, and long, 78′5 E. Pop. estimated at 29,000. The district itself—separated on the north by the Krishna from the Nizam's dominions—contains about 2700 Square miles, and about 27,000 inhabitants. The country possesses considerable works for the purposes of irrigation.

KURRACHI', the only port in Sinde for seagoing ships, hes about twelve miles north-west of the most westerly month of the Indus, in lat. 24 51' N., and long. 67° 2' E. It was taken by the British in 1839, and has since advanced with rapid strides in the path of improvement, the population having in three years (from 1850 to 1853) increased from under 17,000 to more than 22,000. As the mouth of the Indus is barred by sand-banks, K. is virtually the terminus for the traffic on that river. It is connected by the Sinde Railway with Hyderabad. thence, by means of the Indus Steam Flotilla Company's vessels, with Sakar and Multan, and from the latter place by the Punjab Railway, with Lahore, Amritsir, Peshawur, &c. Since January 1860, it has had direct communication, by submarine telegraph, with Muscat and Alexandria. The exports of K. are camels, fish, hides, tallow, ghee, oil, bark, salt, indigo, cotton, and grain; and the imports, metals, hardware, silk, cotton, and woollen goods. K. has an active inland trade with Cashmere, Turkestan, Afghanistan, and Tibet. It contains an English church and school,

KUR-K, one of the governments in the south of Great Russia, lying south of Orel, contains 17,373 square miles, the most of which is arable. The province is watered by feeders of the Dineper and of the Don. The soil being very fertile, large crops of corn are raised, and even in scartly years, K. can supply the neighbouring provinces. The popt in 1864 was 18,37,068, of whom the greater part are employed in tarm-tillage, though a larger number devote themselves to cattle-breeding and orchard-gardening. The principal manufactures are spirits, beather, scap, and saltpetre, and the products are largely exported. Hemp and horses also form important tens in the export trade of the province.

KURSK, the chief town of the government of that name, on the right bank of the Scim, a branch of the Dezna, dates from the 9th century. It suffered considerably from the ravages of the Tartars and Poles, but is still a flourishing town, numbering 28,656 inhabitants, and carrying on a considerable trade in tallow-melting, rope-making, and tanning, K, is also celebrated for its orchards, the fruit of which is nigreat request. Near the town, a fair is of commodities are disposed of, the clinic being manufactured silk and woollen fabrics, augar, tea, horses, &c.

KURU, a name of great celebrity in the ancient or legendary history of India. See MAHARHARATA.

KU'STENLAND (i. e., Coast Districts, Ital. Liteorale), a crown-land of Austria, consisting of the county of Görz and Gradiska, markgrafdom of

3

Istria, and the town of Trieste with its territory, It lies between the crown-land of Carniola on the north-east and the Gulf of Venice on the sonth-west. Area, 3048 square miles; pop. 589,900. Together with the crown-lands of Carinthia and Carnola, it constituted in former times the kingdom of Illyria. The surface is mountainous. The chief rivers are the Isonzo and the Quieto. The soil in general is fruitful; figs ripen without almost any cultivation, and wine is extensively made. In the mountainons districts in the north and north-east the breeding of cattle is the chief branch of industry. Commerce is extensively carried on at the various seaports.

KÜSTRI'N, a town of Prussia, and a fortress of the third rank, is situated in the midst of extensive morasses, at the confluence of the Warthe with the Oder, twenty miles north of Frankfurt. Pop.

KUTAI'EH, KUTAHIA, or KUTAYA (the ancient Cotiœum), an important town of Asiatic Turkey, in Anatolia, capital of the eyalet in which it is situated, stands seventy miles south-east of Brusa, on the Pursuk, a tributary of the Sakariathe ancient Sangarius. It is said to have a good trade, and a population of about 50,000.

KUTAI'S. See TRANSCAUCASIA.

KU"TTENBERG, a mining town of Bohemia, about forty miles east-south-east of Prague. Here, in 1237, silver was found, and the silver-mines were first worked. The first silver groschen were struck here in 1300. The silver-mines have not been worked for about 300 years, the chief mineral products of the district being now copper and lead. Cotton-spinning, cotton-printing, and bleaching, are also carried on. Pop. 10,500.

KUTUSOW, MICHAEL LAURIONOWITSCH GOLEN-TISCHEW, Prince of Smolenskoi, a Russian field-marshal, born in 1745, early entered the Russian army, and in 1787 was appointed governor-general of the Crimea. He distinguished himself in the Turkish war, and after various other services, was appointed in 1805 to the command of the first corps d'armée against the French. On 18th and 19th November of that year, he was victorious over Marshal Mortier at Dürenstein. He was second in command of the allied army, of which the Emperor Alexander himself was commander-in-chief, at Austerlitz. In 1811-1812, he commanded the Russianarmy in the war against the Turks, and notwithstanding his advanced age, he succeeded Barclay de Tolly in 1812, as commander-in-chief of the army against the French, and obtained a great victory over Davout and Ney at Smolensk. He carried on with a revenue of £44,000,

the campaign to its successful termination; but his strength was exhausted, and he died at Bunzlan. 28th April 1813.

KUVERA, the Hindu Plutus, or god of wealth. He owes his name—which literally means 'having a wretched (*lu*) body (*vera*)'—to the deformities with which he is invested by Hindu mythology. He is represented as having three heads, three legs, and but eight teeth; his eyes are green, and in the place of one he has a yellow mark; he wears an earring, but only in one ear; and though he is properly of a black colour, his belly is whitened by a leprous taint. He is seated in a car (pushpaka), which is drawn by hobgolins. His residence, Alaká, is situated in the mines of Mount Kailâsa, and he is attended by the Yakshas, Mayus, Kinnaras, and other imps, anxiously guarding the entrance to his garden, Chaitraratha, the abode of all riches. Nine treasures-apparently precious gems-are especially intrusted to his care. His wife is a hobgoblin, Yakshi, or Yakshini, and their children are two sons and a daughter. As one of the divinities that preside over the regions, he is considered also to be the protector of the north.

KYANISING, the most efficacious method of preserving ships from Dry Rot (q. v.), by injecting into the pores of the wood a solution of corrosive sublimate, was invented by John H. Kyan, who was born in Duhlin, November 27, 1774, and died in 1850.

KYLE, a district of Ayrshire (q. v.).

KY'RIÉ ELEI'SON (Gr. Kyrie eleëson, Lord have mercy), a form of prayer which occurs in all the ancient Greek liturgies, and is retained in the Roman Catholic mass. It follows immediately after the Introit, and forms the introduction to the hymn of praise, 'Gloria in excelsis Deo' (Glory to God on high). The retention of the Greek language in this prayer, is one of many evidences of the predominance of the Greek element in the early Roman Church (Milman's Latin Christianity, i. 10). The same peculiarity occurs in a few others of the Roman services, especially those of the Holy Week.

KYTHU'L, the chief town of the Indian district of the same name, about 1000 miles to the northwest of Calcutta, in lat. 29° 49' N., and long. 76° 28' It is substantially built of brick, having a lofty palace, which looks down from a beautiful grove on a spacious sheet of water. It was only in 1843 that the territory fell to the English East India Company, having lapsed through the failure of heirs. It then comprised more than 500 villages, the Hebrews, doubtless from its resemblance to that implement-a resemblance still traceable in the Phænician. L belongs to the order

of consonants called Liquids, and

has the closest affinity to R. In some languages, there is only one sign for both, as in Pchlwi; and in others, the one or the other sound is altogether wanting. Hence the numerous substitutions of the one sound for the other in the Aryan languages. Thus, Eng. plum, Ger. pflaume, from Lat. prunus; Eng. pilgrim, Lat. peregrinus; Gr. or Lat. epistola, Fr. éplire; the Swiss peasants pronounce Kirche, Kilche; and the Lat. termination -alis becomes, after I, aris—as, materialis, familiaris. L is also interchangeable with n-as, Gr. pneumon, Lat. pulmo; and, rather strangely, with D (q. v.). certain combinations, the l of Latin words has become i in Italian-as, planus, piano; Florentia, In Eng. l is often mute, as in calm, yolk, should. In the Scottish dialect, it is mostly mute in the end of words—as, fa', fu', a', for fall, full, all. Similar to this is the frequent melting of l into u in modern French-thus, à le has become au; chevals, chevaux.

LA. See Solmisation.

LAA'LAND, or LOLLAND (i.e., low land), a Danish island in the Baltic, at the southern entrance to the Great Belt. Area, 452 square miles; population about 56,000. The surface is remarkably flat, and the soil exceedingly fruitful. Forests of beech and oak cover upwards of 50 square miles. The chief town is Nakskov, with a pop. of 3375, a good harbour, and considerable trade. At Aatholm, near the Nysted Fiord, there is the largest, and in exotic plants the richest, private garden in the whole of

LA'BARUM (derivation uncertain), the famous standard of the Roman emperor Constantine, designed to commemorate the miraculous vision of the cross in the sky, which is said to have appeared to him on his way to attack Maxentius, and to have been the moving cause of his conversion to Christianity. It was a long pike or lance, with a short transverse bar of wood attached near its extremity, so as to form something like a cross. On the point of the lance was a golden crown sparkling with gems, and in its centre the mysterious monogram of the cross and the initial letters of the name of Christ, with the occasional addition of the Greek letters A and D. From the crossbeam depended a square purple banner, decorated with precious stones, and surrounded by a rich border of gold embroidery. The cross was substituted for the eagle, which had formerly been depicted on the Roman standards, and there were sometimes other emblems of the Saviour. In the space between the crown and the cross were heads

THE twelfth letter of our alphabet, of the emperor and his family, and sometimes a was called Lamed, i. e., 'ox-goaa,' by ligure of Christ woven in gold.

LABEL. See DRIPSTONE.

LABEL (Fr. lambeau, a strip or shred), the ribbon pendent at the sides of a mitre or coronet.

LABEL, LAMBEL, or FILE, in Heraldry, the mark of cadency which distinguishes the eldest son in his father's lifetime, familiar to us from its entering into the composition of the arms of the Prince of Wales and other members of the royal family. It consists of a horizontal

stripe or fillet, with three points depending from it (fig. 1). When the mark of cadency itself is designated a file, its points are called labels. It is said that the eldest son's eldest son

should wear a label of five points in his grandfather's lifetime, and, similarly, the great-grandson a label of seven points, two points being added for The label extended originally each generation. quite across the shield, and sometimes occupied the upper, though now it is always placed in the lower part of the chief: the points, at first rectangular, assumed in later times the form called pattée, dovetailed, or wedge-shaped; and more recently, the label ecased to be connected with the edges of the shield. Edward I., in his father's lifetime, bore the arms of England within a

label not of three, but of five points azure, joined to the head of the shield, and interlaced with the tail of the uppermost lion (fig. 2); Edward II., when Prince of Wales, used indifferently the label of three or of five points, as also did Edward III.; but from the time of the Black Prince downwards, the cldest son of

the king of England has invariably differenced his arms with a label of three points argent, and the practice has been for the younger sons also to bear labels, which are sometimes of other colours and more points, and differenced by being charged with fleurs-de-lis, castles, torteaux, hearts, crosses, &c., as directed by the sovereign by sign-manual registered in the College of Arms. The practice of differencing by the label which is thus in viridi observantia in our own and other royal families, is less used by subjects. Like other marks of eadency, labels are sometimes horne as permanent distinctions by a particular branch of a family.

LABIA'TÆ (Lamiaceæ of Lindley), a natural order of exogenous plants, containing almost 2500 known species, mostly natives of temperate climates. They are herbaceous, or more rarely half-shrubby, and have 4-cornered stems and opposite branches; and opposite leaves, without stipules, abounding in receptacles of volatile oil. The flowers are often in cymes or heads, or in whorls; sometimes solitary, The calyx is inferior, with five or ten teeth, or

2-lipped. The corolla is hypogynous, 2-lipped, the course a productive labourer. The same quality lower lip 3-lobed. The stamens are four, two long and two short, or by abortion only two, inserted into the corolla. The ovary is deeply 4-lobed, seated in a fleshy disk, each lobe containing a single ovule; there is a single style with a bifid stigma. The fruit consists of 1-4 achenia, enclosed within the persistent calyx.—A general characteristic of this order is an aromatic fragrance, which in many species is very agreeable, and makes them favourites in our gardens. Some are weeds with an unpleasant odour. Many are natives of Britain. Some are used in medicine, and others in cockery for flavouring. Mint, Marjoram, Rosemary, Lavender, Sage, Basil, Savory, Thyme, Horehound, Balm, Patchouli, Germander, and Dead Nettle, are examples of this order.

LA'BORATORY, ROVAL, an extensive military manufacturing department in Woolwich Arsenal Although it has existed for many years, it was only in 1855 that the present very large establishment was organised. Here are foundries for the casting of shot, shell, grape, &c.; apparatus for the manufacture of percussion-caps, which are formed —hundreds at a time—out of the copper sheet; presses where rifle-bullets are squeezed into shape; fuses in all stages of manufacture; and a thousand other instances of combined ingenuity and power. Conspicuous among the mechanism may be mentioned the making of paper for cartridges, and subsequently the making and filling of the cartridges themselves. Government liberally grants permission (through the War Office) to inspect the factory.

The cost of the Laboratory varies according to the accumulation of stores, from £503,935 in 1861-1862 to £195,743 in 1863—1864. There are laboratories—though on a comparatively small scale—at Portsmouth and Devonport.

LABOUR, in Political Economy, a term so dependent for its meaning on the circumstances in which it is used, that any scientific definition of it would lead to misunderstanding. The best service, in fact, towards rendering it intelligible, is to clear away some attempts that have been made to subject

cannot be denied to the man who beams a web for the loom; but if he shares in the production of the cloth, so does the overseer who walks about and adjusts the industrial arrangements of the manufactory. Having included him, we cannot well say that the peliceman, who keeps order in the district. and enables its manufactures to go on, should be excluded. Again, the man who contributes to make a book, of course appears as a productive labourer; but what the author contributes is not matter, but intellect; and it would be difficult to maintain that he ceases to be productive if he deliver such matter in an oration or a sermon. can hardly count the distiller, who makes a glass of whisky, a productive labourer, and exclude the musician, who produces another and less dangerous excitement. It is equally impossible to draw the line between bodily and intellectual labour, since there is scarcely a work to which man can put his hand which does not require some amount of thought. A distinction between capital and labour has often heen attempted to be established with very fallacious and dangerous results. Capital in active operation infers that its owner labours. If the capital is not laboured, the owner must be content to let it lie at ordinary interest. If he want profit from it, he must labour, and often severely. In a large manufactory, where the pro-prietor is supposed to be a gentleman at large, drawing his fortune from the sweat of the brow of his fellow-men, he is often the most anxious and the hardest-worked man in the whole establishment.

LABOURERS. The only peculiar laws affecting labourers are where they come within the description of 'servants in husbandry, artificers, calico-printers, handicraftsmen, miners, colliers, keelmen, pitmen, glassmen, potters, labourers, or other persons'—the word 'labourer' applying to a description of employment which, though comprehensive, is difficult to be defined. There must be a contract of service of some kind. The peculiarity consists in a summary remedy being provided for and against them before justices of the peace, who may compel them to serve out the time they contracted for, under a penalty it to scientific analysis and definition. It has been of fine or imprisonment, and on the other hand, may separated into productive and unproductive, but no other the masters to gay the wages. See SEXVAYS, but no other the masters to gay the wages. See SEXVAYS, see Labourers' wages are problinked from being paid in piece of wood on his lathe and makes a top is of kind or with goods by the Truck AC (Q. V.).
